In the first election under this constitution, Labour obtained 24 seats, but in 1949 the Labour party split and a Workers' party was formed. The island was administered between 1951 and 1954 by a coalition government drawn from the Nationalist and Workers' parties. The reunited Labour front was returned to power with 23 seats in 1955. The prime minister, Dom Mintoff, began negotiations looking toward Malta's integration with the United Kingdom; a round-table conference in London recommended Maltese representation in the house of commons but for three years Malta remained deeply divided on the issue. The Nationalist party under its leader, G. Borg Olivier, claimed ultimate dominion status; the Progressive Constitutional party led by Miss Mabel Strickland proposed quasi-dominion status. Following disagreement with Britain on economic and financial aid, Mintoff resigned in April 1958 and began to agitate for independence. Constitutional government broke down, a state of emergency was proclaimed and the 1947 constitution was revoked in 1959, being replaced by another which gave the governor full legislative and executive powers. Vigorous protests were raised and the political parties campaigned for an immediate return to self-government. A rift in the Nationalist party led to the formation of the Democratic Nationalist party (led by H. Ganado). A constitutional

commission was sent to Malta in Oct. 1960 to hear views on a future constitution. The Progressive Constitutional party proposed full internal self-government. The Democratic Nationalist party asserted its final aim of full autonomy within the Commonwealth but was prepared to consider, as an interim stage, a status similar to that of "internally self-governing state within the commonwealth" conferred on Singapore in 1958. The Nationalist party and the Malta Labour party boycotted the commission on the grounds that the terms of reference were too restricted.

The commission reported in March 1961 and met with a mixed reception. The new constitution was promulgated in Oct. 1961, and elections were held in Feb. 1962, with the Roman Catholic Church actively opposing the Labour party. The Christian Workers' party, which was hostile to Mintoff's anticlerical policies, won 4 seats; Mabel Strickland alone of her party was returned; the Democratic Nationalist party obtained 4 seats; the Labour party 16; and the Nationalist party 25. G. Borg Olivier formed a government and secured important constitutional amendments, but when he was refused additional aid by the U.K. government, he demanded independence. At a conference in London (July 1963) the Maltese parties failed to agree on an independence constitution. A referendum, upon which the British government was to have based its decision, was held in May 1964, but proved inconclusive. However, after further negotiations agreement was reached in July 1964 on the new constitution, and on defense and financial aid. On Sept. 21, 1964, Malta achieved independence within the commonwealth. (W. B. PN.; A. G.)

POPULATION

The earliest recorded population estimates for Malta are those of an Arab amir of A.D. 991, giving a total of 21,000, and of 1240, showing 3,800 and 1,800 for Malta and Gozo, respectively. By about 1530 the total seems to have been about 20,000, of whom 5,000 were knights and their followers (of non-Maltese origin). Proper censuses began in 1842, when the total of 114,000 included 14,000 on Gozo. By 1957 the total had reached 319,620, with densities per square mile of 3,074 in Malta itself and 1,060 in Gozo. The population in 1962 was 328,989. The non-Maltese element (mainly servicemen and their families) fluctuates considerably and is not always clearly separable in census data.

Before the knights' arrival the inhabitants tended to cluster in small inland villages, with one major fortified town in the centre of each of the two main islands. When Valletta was built as a harbour and fortress on a hitherto barren peninsula, population was attracted to the city and its environs, with a parallel spread of settlement outside the old refuge towns. Valletta's population reached a maximum in the mid-19th century, after which it gradually declined. Twentieth-century trends were the establishment of new coastal settlements, the expansion of older ones and the peopling of the empty north round Mellieha bay and St. Paul's bay. In Gozo, however, there was less settlement on the coast.

The crude birth rate in the Maltese Islands, more than 40 per 1,000 in the 1840s, declined thereafter. There was a temporary increase in the 1880s and 1890s, but from the mid-19th century to the mid-20th century births averaged 30-35 per 1,000 in peacetime. In the 1950s there was a pronounced decline, the rate dropping to 26.1 in 1960. Indeed, from the early 1930s to the late 1950s the downward trend in births was more marked than in many other European countries. However, the death rate in Malta declined more rapidly than the birth rate. In the 19th century the figure fluctuated as a result of epidemics of cholera, smallpox and Malta (undulant) fever, and until World War II the death rate was generally between 20 and 30 per 1,000. From the late 1920s, as public health improved, there was a marked fall, the rate dropping to an average of less than 11 in the 1950s. By 1960 an excess of deaths over births (not uncommon a century earlier) had not occurred for nearly 20 years.

Thus, in the 1950s, because of the low death rate and relatively high birth rate, the natural increase was at its highest recorded level, the annual increment being about 5,000, or ten times that of a century earlier. Between 1842 and 1956 the natural increase

of population was 267,000. Of this number about 70,000 emigrated, leaving a net increase of about 200,000. Although the proportion of Maltese who married was smaller than in Great Britain, for example, the average age of marriage was low and the fertility of married couples very high. Indeed some authorities concluded that in the 1950s the nuptial fertility rate was about 25% above that of the Republic of Ireland, long regarded as the highest in the world.

Because of the rapid growth of numbers and restricted natural resources, emigration played an important role. For a time in the 19th century many Maltese moved to the coastal zones of north Africa and the Levant, but in the 20th century America, Australia and Great Britain proved the more attractive. Emigration reached a peak in 1954, when more than 8,000 Maltese settled in Australia alone. In the late 1950s there were fewer outlets for migrants, and it became government policy to restrict emigration.

Language.—Among themselves the people speak the Maltese language. A significant but declining number also speak Italian, which was once the language of the church and administration, but in 1934 Maltese replaced Italian as one of the two official languages, the other continuing to be English.

Religion.—Malta has been described as one of the most devoutly Roman Catholic countries in the world; there are virtually no significant Protestant bodies other than those catering for non-Maltese. It is significant that the archbishop of Malta takes official precedence immediately after the governor. The educational system is inspired, patterned and partly maintained by the church, which also imposes a censorship on literature and films entering the island. After World War II, however, there was growing opposition to Roman Catholicism from left-wing trade unions and the Labour party, particularly in relation to the church's activities affecting the body politic.

Customs and Culture.—Malta's cultural pattern reflects its geographical situation, close to Europe but also not far from Semitic Africa. Family ties are extremely strong. Townsfolk often return temporarily to the family farm to help at harvest time, regarding themselves as part owners. Migrants overseas often hope to be joined by relations, and others return to Malta because of family connections. Café life is highly developed, and the main street of Valletta is closed to vehicles for a part of each evening in order to allow strolling and conversation. Women play a less prominent part in social life than men, but their role is by no means subordinate. Some women still wear the *faldetta*, a voluminous black hood and cape peculiar to Malta. There is an anglicized population, sometimes referred to as the Sliema group, as well as a Maltese order of nobility. (W. B. Fr.)

ADMINISTRATION AND SOCIAL CONDITIONS

Constitution and Government.—Malta is a constitutional monarchy and an independent member of the Commonwealth of Nations. The parliament of Malta consists of the governor-general, appointed by and representing the British sovereign, and a house of representatives of 50 members elected from ten electoral divisions by the single transferable vote system of proportional representation. The statutory life of parliament is five years. Executive authority is vested in the British sovereign but is normally exercised by the governor-general on the sovereign's behalf. The governor-general is usually required to act in accordance with the advice of the cabinet (the prime minister and other ministers). He appoints as prime minister the member of the house of representatives who is best able to command the support of a majority of the members of the house. The other ministers are appointed by the governor-general on the advice of the prime minister. The cabinet has the general direction and control of the government of Malta and is collectively responsible to parliament. The constitution contains a declaration of principles and a chapter on the fundamental rights and freedoms of the individual.

Taxation.—Before World War II indirect taxation on food-stuffs and other consumer goods accounted for about half of total revenue and constituted a heavy burden on the poorer classes.

After the war, although indirect taxation remained high, the burden was eased by the sharp rise in income per head. Bread and other foodstuffs were subsidized and high *ad valorem* duties were imposed on luxuries. Moreover, direct taxation was increased, by income tax on a progressive scale being introduced in 1948. By the early 1960s, when less than two-thirds of the revenue was derived from taxation, about one-fifth of the tax revenue was accounted for by income tax and succession duty.

Living Conditions.—In the early 1960s, of about 90,000 gainfully occupied persons, three-quarters were wage and salary earners, mostly earning between £6 and £10 a week. Within ten years the average wage of employees had risen by nearly half, and in 1960 the minimum wage was raised by arbitration to £6 0s. 9d. a week. About 35 trade unions had a total membership of more than 20,000.

A social insurance program was introduced in 1956 covering employees over 14 years of age and providing cash benefits for marriage, unemployment, sickness, widowhood, orphanhood, industrial injury and old age. Under the National Assistance act, 1956, supplementary relief is given to households with limited means. A district medical service provides free treatment for the poor. In the early 1960s there were seven government hospitals in Malta itself and five in Gozo. Of about 75,000 households nearly one-fifth were officially described in 1957 as overcrowded. Most households lived in unfurnished accommodation, for which the rent averaged £7 a year for one room and £5 for each additional room, but about one-quarter were owner-occupiers.

Education.—In 1946 education became compulsory for children between 6 and 14, but full-time attendance for all was not achieved until ten years later. Primary education is mostly carried on at free government schools, the principal subjects taught being religion, arithmetic, English and Maltese. The grammar schools (also free) provide a course of studies fulfilling the requirements of either the general certificate of education or the Malta matriculation certificate. Students may then pass on to either the Royal University of Malta or one of the two teacher-training colleges. The university was founded in 1592 as the College of the Society of Jesus and became completely autonomous in 1961. Other educational facilities include evening classes for languages and commercial subjects, secondary technical schools, a technical school for craft training, a school for apprentices on the day-release (part-time) system, a small boarding school, a school of art and governmental industrial training centres.

Justice.—The main body of Maltese law was codified between 1854 and 1873. It is based mostly on French and Neapolitan law, but English principles have been followed in certain commercial and maritime matters and in procedural criminal law. Judicial precedent has no binding force. The chief justice and the seven other judges who preside in the superior courts are appointed by the governor on the advice of the prime minister. Professional magistrates sit in the inferior courts. Members of the bench, who are all Maltese, can be removed only in the event of proved misbehaviour or incapacity. The official language of the courts is Maltese, but an exception is made for English-speaking persons. (A. G.)

ECONOMY

Malta has very few natural resources. There are no important minerals other than building stone, and even soil and water are in restricted supply. Malta's assets have been its geographical position—on an important intercontinental routeway and as a dominating strategic point for the central Mediterranean; a good deepwater harbour at Valletta (these are infrequent in the Mediterranean); a mild climate; and an abundant labour supply.

In the time of the knights income from outside (mainly from the estates owned by the order and by the knights personally) was an important element in the Maltese economy, perhaps exceeding £150,000 annually. There was also a valuable output of native cotton and cotton goods, both of which were exported, mainly to Spain. By the end of the 17th century this trade had reached an aggregate annual value of £500,000. About 1800, however, both sources of wealth were lost, the former by confiscation (most of

the knights' estates were in France), the latter by an embargo on imports into Spain, following which the whole cotton industry, growing and manufacturing, gradually declined, becoming virtually extinct about 1860–80. During the Napoleonic Wars Malta was for a time an entrepôt for a large contraband trade with Europe and experienced a short-lived boom. Later in the century the island was important for bunkering, until, with the growth in size of ships, frequent intermediate coaling points were no longer needed, particularly as Malta had little commercial cargo justifying a call. Hence, more and more emphasis was placed on navy shipping, for which Maltese harbours were especially useful, and this function came to exert a predominant, almost overwhelming influence on Maltese economic life. Also, first army and then air force bases were gradually established. As a result, the whole economy of Malta became first influenced and then distorted by the British connection. The proportion of Maltese commerce based on indigenous resources and manufactures grew progressively smaller as service and governmental activities assumed greater significance. By the late 1950s, out of about 90,000 gainfully employed nearly 70,000 were employed either by the Maltese government, directly by the armed forces or in private industry and services supplying the armed forces. In the early 1960s, however, there was a decline in the armed forces stationed in Malta and some displaced workers were absorbed in new civilian industries.

Agriculture.—Because of the irregular nature of the surface and the easily eroded soil, cultivated areas occur mostly as strips or patches held by retaining walls that dominate the landscape. Outside the towns Malta appears to be a mass of low, irregular, stone walls, with tiny fields created and maintained by immense effort. Because of the size of the fields large agricultural machinery cannot be used, and most cultivation is either by hand, using light implements or, increasingly, by rotary cultivator. Rapid population growth has resulted in the subdivision of many holdings, and farms often consist of a number of small, scattered strips.

The main crops are wheat and barley, vegetables, fruit and fodder crops. These include green wheat and barley, and vetch but the chief fodder crop is sulla (*Hedysarum coronarium*), a tall leguminous plant with a purple flower, covering about 10,000 ac. Because of the mild winters, a wide variety of plants can be grown, and in some parts enlightened methods are used with elaborate rotation of crops. Potatoes, tomatoes and some onions are grown for export, potatoes being especially important because, though small in quantity, they are very early and command a high price. Citrus and other fruit are grown mostly for home consumption, and the vine is also important in the west and north of the island. Wine is made, but it is of poor quality and suffers greatly from competition by foreign wine and from locally produced beer. The annual wine import averaging about £70,000 annually illustrates a remarkable paradox for a Mediterranean island. Again in sharp contrast to neighbouring areas, there is an almost complete absence of olives.

Animal husbandry is important. For long the goat was the chief supplier of milk, its tolerance of poor fodder and summer heat making it well suited to Maltese conditions. However, since goats' milk is the main carrier of undulant fever, the government began after World War II to follow, with some success, a policy of replacing goats by cows.

Fishing.—The fishing industry is comparatively unimportant, because of the relative lack of fish in the Mediterranean, the deep-sea bottom round most of the island and competition from foreign fishers. Fishing, being carried on from very small inshore boats, is affected by the weather, with frequent suspension of activity during December–April. In early summer lamps are used to attract the fish. In the late 1950s only about half the 600 fishermen were fully employed, but there were plans for improving the fishing harbour at Marsaxlokk, where about one-quarter of the 1,200 fishing boats were based.

Industry.—After World War II, and especially after 1959, efforts were made to attract industry, and a number of British and continental European firms established small plants. Brewing is a principal activity, and small consumer goods are also produced.

such as crown corks, buttons, clothing (including nylon stockings), foodstuffs and matches. Two traditional activities of Malta are lacemaking (still carried on in linen and cotton, especially in the Rabat-Mdina area) and silver filigree work (mostly in Valletta). In 1959 the naval dockyard, which then employed about 15% of the total working population of Malta, was transferred on a 99-year lease to a Welsh ship-repairing firm, the annual rent being fixed at £30,000 of which half would go to the Maltese government. A five-year capital development program was approved with the aim of attracting new industries, developing tourism and carrying out capital works. The Royal Navy agreed to continue major repairs in Malta for a short interim period, and in 1961 the British government undertook to lend most of the capital required for converting the dockyard to civilian use. Considerable hopes were raised by the growing oil traffic in the Mediterranean, especially following discoveries of oil in Libya, only 220 mi. away, which has few good harbours where extensive tanker maintenance and repairs might be undertaken. Between the late 1940s and early 1960s Malta's visible exports paid for only 5%–10% of its imports, and local agriculture supplied less than one-quarter of Malta's food requirements. The situation was being met by a grant-in-aid from the British government.

Trade and Communications.—Britain is the chief purchaser of Maltese products, as well as the chief supplier of goods, although Libya and countries of the northeastern Mediterranean also buy from Malta. The principal exports are potatoes, vegetables, hides and skins, buttons, hosiery and scrap metal, and the main imports foodstuffs, beverages, fuel oil, machinery and textiles.

Malta's road system was much developed and improved after World War II. Most parts of the island can be reached by bus services radiating from Valletta, and, subject to weather conditions, there are regular sailings from Valletta to Gozo. From a modern airfield at Luqa there are direct services to Britain, Italy, north Africa and the Levant. Fewer large passenger vessels call at Valletta than formerly, but there is much movement of cargo ships and the cruising traffic is growing in importance.

MALTA FEVER: see BRUCELLOSIS.

MALTE-BRUN, CONRAD (MALTE CONRAD BRUUN) (1775–1826), one of the leading French geographers and the author and co-author of several extensive geographies, was born on Aug. 12, 1775, at Thisted, Den. A supporter of the French Revolution, he was banished from Copenhagen in 1800 for his political verses and pamphlets. Eventually he established himself as a journalist and geographical writer in Paris. His writings include volumes one through six of the *Précis de la géographie universelle* (1810–29). He originated the *Annales des voyages* in 1808. Malte-Brun took a broad view of geography, regarding it as complementary to natural history and as intimately related to the history, customs and institutions of mankind.

Malte-Brun was a founder of the Société de Géographie of Paris in 1822, the first modern geographical society. He died in Paris on Dec. 14, 1826.

His second son, Victor Adolphe Malte-Brun (1816–1889), followed his father's career of geographer. His special interest was the course of exploration, especially in Africa and the arctic.

(G. R. Cz.)

MALTESE LANGUAGE, the only Semitic tongue officially written in the Latin alphabet, is a modern Arabic vernacular closely related to the western (Tripolitan, Algerian) Arabic dialects. In its phonetics, morphology, syntax and vocabulary it shows the strong influence of an earlier, later and continuing

Sicilian (Latin) form of speech (cf. Maltese: *il-maktur*, "the handkerchief"; Sicilian: *maccaturu*). The contention that Maltese is descended from an ancient native Phoenician tongue current in the island at the time of the Roman occupation in 218 B.C. and continuing until A.D. 870, the date of the Saracen conquest, is completely untenable on cultural, historical and linguistic grounds. The Maltese of Gozo has interesting archaisms.

MALTHUS, THOMAS ROBERT (1766–1834), English economist and demographer, best known for his theory that population increases faster than production, was born on Feb. 14, 1766, into a prosperous middle-class family dwelling near Dorking. His father's opinions and temperament are suggested by his friendship with David Hume and his devotion to the person and principles of Jean Jacques Rousseau. Before entering Jesus college, Cambridge, Malthus was educated largely at home. He was elected fellow of his college in 1793, took holy orders in 1797, married in 1804, and in the following year was appointed professor of history and political economy at the East India company's Haileybury college. He died near Bath on Dec. 23, 1834.

His opinions and teachings reflect largely a reaction—amiably conducted—to his father's views and the doctrines of the French Revolution. (Unlike Rousseau, who viewed human affairs from a theoretical standpoint, Malthus was an empiricist and began from the harsh realities of his time.) This reaction is developed in the tradition of British economics which would now be called sociological. In 1798 he published anonymously the first edition of *An Essay on the Principle of Population as it Affects the Future Improvement of Society, with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and Other Writers*. He briefly, crudely, yet strikingly argued that infinite human hopes for social happiness must be vain, for population will always tend to outrun the growth of production. The increase of population will take place, if unchecked, in a geometrical progression, while the means of subsistence will increase at only an arithmetical progression. Population will always expand to the limit of subsistence and be held there by famine, war and ill-health. "Vice" (which included for Malthus contraception), "misery" and self-restraint alone would check this growth. Malthus was an economic pessimist, viewing poverty as man's inescapable lot. The argument in this first edition is essentially abstract and analytical. To subsequent editions which expanded the long pamphlet of 1798 into a massive book (6th ed. in 1826), Malthus added much factual material and illustration of his thesis, but at no point did he adequately set out his premises or examine their logical status. Nor did his handling of factual data reach any high level of sophistication. The American sociologist Kingsley Davis has remarked that Malthus' theories never had the empirical validity that he claimed for them but were nevertheless of great theoretical significance.

In biology it was Malthus who first set Charles Darwin and A. R. Wallace, quite independently, on the train of reasoning which led to the principle of natural selection. In economics the Malthusian theory of population was incorporated in the systems of Malthus' close friend David Ricardo (they met in 1811) and of subsequent economists. It acted as a brake on economic optimism, helped to justify a theory of wages that made the minimum cost of subsistence of the wage earner a standard of judgment, and discouraged charity. Demography is largely an increasingly statistical commentary on the first edition of the *Essay on Population*. The facts of industrial society, however, controvert the basic Malthusian theory: in industrial society national income tends to outpace population growth, and the size of the family in such societies has become a function of choice owing to the adequacy and prevalence of birth control. We do not yet understand much of the social psychology and sociology of fertility and of fluctuations in reproductive behaviour; we know that "misery and vice" do not explain them. In nonindustrial societies, however, the Malthusian model seems to possess a potentially threatening validity.

The influence of the theory of population on social policy was

great. It had been believed that fertility itself added to national wealth: the poor laws perhaps encouraged large families by their doles. If they had "never existed," wrote Malthus, "though there might have been a few more instances of severe distress, the aggregate mass of happiness among the common people would have been much greater than it is at present." The laws limited the mobility of labour, encouraged fecundity and should be abolished. For the most unfortunate it might be licit to establish workhouses, not "comfortable asylums," but places where "fare should be hard" and "severe distress . . . find some alleviation." These principles were to be enacted, were to enervate charity and cripple social reform for a century. Only by late marriage and "moral restraint" might, according to strict Malthusianism, the condition of mankind be, if briefly, relieved.

In 1800 Malthus published *An Investigation of the Cause of the Present High Price of Provisions*. He approached the problem of what determines price with a less rigorous analysis than Ricardo and with a bias to explanation in terms of an institutionally determined "effective demand," a phrase he invented. In 1820 in his *Principles of Political Economy Considered with a View to their Practical Application* he goes so far as to propose public works and private luxury investment—almost as Bernard de Mandeville did over a century earlier—as palliatives of economic distress which would increase effective demand. He went further and criticised thrift as a virtue knowing no limit; to the contrary, he argued, "the principles of saving, pushed to excess, would destroy the motive to production." To maximize wealth a nation must balance "the power to produce and the will to consume." In fact Malthus, as an economist, anticipated the economic discoveries of Lord Keynes in the 1930s and there is an unresolved discord between the economic consequences of his demography and the policy implications of his contribution to pure economics. For a century after his death the former was the dominant influence in economic thought and policy.

(D. G. MACR.)

MALUS, ÉTIENNE LOUIS (1775–1812), French physicist, who made important discoveries concerning the polarization of light, was born at Paris on June 23, 1775. Dismissed without receiving a commission from the military engineering school at Mézières, because he was regarded as a suspected person (1793), Malus entered the French army as a private soldier. He was later sent to the newly established École Polytechnique in Paris, and after three years at the school was admitted into the corps of engineers. In 1798 he joined the Egyptian expedition, remaining in the east until 1801.

After his return, he held official posts successively at Antwerp, Strasbourg and Paris and did research in optics. He published a paper in 1809 covering his discovery of the polarization of light by reflection. The discovery gave impetus to the optical investigations of natural crystals by Sir David Brewster and others. In the following year Malus published a memoir on the theory of double refraction in crystals. He died in Paris on Feb. 23, 1812.

MALUS, a genus of the rose family (Rosaceae) including the apple (*q.v.*) and many ornamental and edible crab apples (*q.v.*).

MALVACEAE, the mallow family, a large group of flowering dicotyledonous plants, containing about 90 genera and over 1,500 species (sometimes arranged in fewer genera and species). Representatives occur in all except the coldest parts of the world but are most numerous in the tropics. Economically, the most important member of the family is cotton (*q.v.*, *Gossypium*). Several *Hibiscus* (kenaf, roselle) produce fibres that are of lesser importance. The green fruits of okra (*q.v.*; *Hibiscus esculentus*) are cooked and eaten, and the mucilage secreted in tissues of some

species has been used in certain confections (see *MARSH MALLOW*) and for other purposes. Thirty genera supply many species valued as ornamentals, among which are common mallow (*Malva*), holyhock (*Althaea*), rose mallow or rose of Sharon (*Hibiscus*), Indian mallow (*Sida*), checkerbloom (*Sidalcea*), poppy mallow (*Callirhoe*), flowering maple (*Abutilon*), false mallow (*Malvastrum*), tree mallow (*Lavatera*), wax mallow (*Malva viscosa*), *Kitabaea* and *Malope*. In the U.S. are 27 genera; additional ones occur from Mexico into South America. Only three genera (*Malva*, *Althaea*, *Lavatera*) are native in Great Britain, but the family is well represented in the Mediterranean region, Africa and Asia.

The Malvaceae includes annual and perennial herbs, shrubs and small trees. Their leaves, which alternate on the stem, are entire, toothed or palmately lobed or divided and mostly with deciduous stipules. Stellate hairs commonly cover some or most vegetative parts and even occur on the parts of petals exposed in bud in a few

ROCHE
MUSK MALLOW (*HIBISCUS MOSCHATELLUS*)

species. The flowers are regular, hermaphrodite (sometimes functionally either male or female) and often showy. They are borne alone or in loose clusters in the leaf-axils. A whorl of three or more bractlets is generally present below the calyx in many genera. Typically, there are five sepals and five petals with the petals tightly twisted in bud. The petals are fused to the staminal column at their bases and fall with the tube when the flower withers. A feature of the family is the central staminal column, surmounted by many kidney-shaped, one-celled anthers that open by terminal slits. The pollen grains are large, spherical and ornamented with spines.

Pollination is by insects that seek the honey secreted in pits between the bases of the petals; self-pollination also occurs through the twisting of the stigmatic arms to touch the anthers. Carpels vary from two to many; when they number five the carpels are opposite the sepals (*Hibiscus*) or opposite the petals (*Abutilon*). In species having numerous carpels (*Malva*, *Lavatera*, *Sphaeralcea*) the carpels are arranged in a whorl around the top of the floral axis, with the stigmatic branches equaling or double the number of carpels and rising above the tip of the column. Each carpel produces one ovule (*Malva*, *Malvastrum* to several ovules (*Sphaeralcea*, *Wissadula*, *Gossypium*, *Hibiscus*).

The fruit is a berry in *Malva viscosa*, a capsule in *Hibiscus* and *Gossypium* and a one- to several-seeded schizocarp in others. Marginal hooks or elastic strands on the schizocarps and mucilage or hairs on the seeds aid in dispersal.

Genera range in size from ten or fewer species (*Anoda*, *Ilamsea*) to more than 200 (*Sphaeralcea*, *Hibiscus*). Several genera are exclusively American (*Sidalcea*, *Callirhoe*); others are almost worldwide in distribution (*Abutilon*, *Hibiscus*, *Malva*). A few species are troublesome weeds, *Malva rotundifolia* (called cheeses for the shape of its fruit) being the most pernicious. See also *ABUTILON*; *HIBISCUS*; *HOLLYHOCK*; *MALLOW*.

MALVERN, an urban district and spa resort of Worcestershire, Eng., lies 8 mi. S.W. of Worcester. Pop. (1961) 24,373. It is mainly on the eastern slopes of the Malvern hills, which run north and south for nine miles and rise from the Severn valley to a height of 1,395 ft. in the Worcestershire Beacon. The hills are administered by the Malvern Hills conservators and part of the southern end of the range is under the protection of the National Trust. Malvern chase, originally a crown land and forest, was granted to the earl of Gloucester by Edward I. The name Malvern is collectively applied to a number of former villages and hamlets.

The principal town is Great Malvern, lying beneath the Worcestershire Beacon. In early times Malvern was an ecclesiastical settlement and at Great Malvern was the Benedictine priory which

arose in 1085 out of a hermitage endowed by Edward the Confessor. The priory church of SS. Mary and Michael is a cruciform Perpendicular building, with a Norman nave and font. It is famous for its 15th-century glass and encaustic tiles; the great window in the north transept was presented by Henry VII in 1502.

Little Malvern, with remains of a Benedictine priory, now a parish church, lies at the foot of the Herefordshire Beacon, which is crowned by extensive and well-preserved hill fortresses of Iron Age date. Malvern Link, West and North Malvern and Malvern Wells are also in the district.

Malvern is now an educational and cultural centre, with Malvern college for boys (founded 1862), a further education college and school of art, a girl's college and a theatre (home of the Malvern Dramatic festival). Its mineral springs and pleasant surroundings have made it a favourite health and tourist centre. The large ballroom of the winter gardens is often used for conferences. The Royal Radar establishment, which is housed in Malvern, is the largest single employer in the town.

Jenny Lind, the Swedish singer, lies in the cemetery near the station, and Sir Edward Elgar, the composer, is buried in the Roman Catholic cemetery. (AL. C. C.)

MALVY, JEAN (1875–1949), French political figure whose tenure of the ministry of the interior led to his trial for treason during World War I, was born at Figeac, Lot, on Dec. 1, 1875. Inclined to the left in his sympathies, he entered the chamber of deputies as a Radical in 1906. He served as undersecretary under Ernest Monis (1911) and Joseph Caillaux (1911–12) and became minister of commerce under Gaston Doumergue (1913–14) and then minister of the interior under René Viviani. When World War I broke out he remained minister of the interior under Aristide Briand and Alexandre Ribot (1915–17); but on July 22, 1917, Georges Clemenceau charged him with lax administration in dealing with defeatists. Malvy resigned on Aug. 31, and the fall of the Ribot cabinet ensued. In October the royalist Léon Daudet brought against him a general accusation of high treason. At Malvy's own request the chamber of deputies decided that the senate, sitting as a high court, should try him on all the stated charges. On Aug. 6, 1918, he was acquitted of the charge of high treason but found guilty of *forfeiture* (culpable negligence in the performance of his duties) and sentenced to banishment for five years. He spent his exile in Spain.

Pardoned and returned to the chamber of deputies in 1924, Malvy represented France at the negotiations with Spain (Jan.–July 1925) for joint action against Abd-el-Krim. In Oct. 1925 he became chairman of the finance committee of the chamber. He entered the Briand cabinet of March 1926 as minister of the interior but this appointment roused bitter controversies and he resigned. He was again chairman of the finance committee in the chamber elected in 1928 and from 1932 to July 1940, when he retired from politics. He died in Paris on June 9, 1949. He had been a clever and able politician, but somewhat lacking in character. See François-Albert, *Le Procès Malvy* (1920). (J. G. DE C.)

MALWA, a historic province of India, which gave its name to one of the political agencies into which Central India was divided under British rule. Strictly, the name is confined to the hilly tableland, bounded south by the Vindhya mountains, which drain north into the Chambal river; but it has been extended to include the Narmada valley farther south. From the Junagadh rock inscription it may be inferred that, in the 2nd century A.D., Rudradaman, the greatest of the western satraps, ruled over Avanti (*q.v.*); that is, both eastern and western Malwa. It formed part of the Gupta empire and was later annexed by Harsha. In the 9th century it was absorbed by the Gurjara-Pratiharas between whom and the Rashtrakutas of the Deccan the Narmada formed a fluctuating frontier. The first records of a local dynasty are those of the Paramaras, a Rajput clan, who ruled for about four centuries (800–1200) with their capital at Ujjain and afterward at Dhar.

The Muslims invaded Malwa in 1235 and in 1401 Dilawar Khan Ghorî founded an independent kingdom, which lasted till 1531. In 1561 Malwa was annexed to the Mogul empire by Akbar. On the breakup of that empire, Malwa was one of the first prov-

inces to be conquered by the Marathas, when it became a cockpit for fighting between the rival Maratha powers, and the headquarters of the Pindaris or irregular plunderers. The Pindaris were extirpated by the campaign of Lord Hastings in 1817, and the country was reduced to order by Sir John Malcolm.

Malwa is traditionally the land of plenty, in which sufferers from famine could take refuge. But in 1899–1900 it was visited by drought, followed by plague.

MALWA is also the name of a large tract in the Punjab, south of the Sutlej river, which is one of the two chief homes of the Sikhs, the other being known as Manjha. It includes the districts of Ferozepur and Ludhiana, together with the former cis-Sutlej states of Patiala, Jind, Nabha and Maler Kotla, all of them now in Punjab, India.

See R. Sinha, *Malwa in Transition* (1935).

(C. C. D.)

MAMARONECK, a village in Westchester county, N.Y., U.S., is located on Long Island sound, about 5.5 mi. N.E. of the Bronx. Its name derives either from Mamaronock, a Wequaeskeek (Mohican) chief, or from an Indian word meaning "where the fresh water meets the salt." Although part of a larger area acquired by the Dutch West India company in 1640, the site of Mamaroneck was resold by its Indian inhabitants on Sept. 21, 1661, to John Richbell, an English merchant from Massachusetts bay. In 1698 Caleb Heathcote, later mayor of New York city, purchased Mamaroneck from Richbell's widow. More than a century later James Fenimore Cooper resided in Heathcote Hill (De Lancey manor house) for several years and there wrote *The Spy*. Mamaroneck is a suburban community, with a fine marina and Harbor Island park. Major manufactures include metal-spraying equipment, electronic components, water heaters and tanks, lighting fixtures and metal stampings. It became an incorporated village in 1895 and adopted a mayor-village manager system of local government in 1931. For comparative population figures see table in NEW YORK: *Population*. (M. D. HH.)

MAMBERAMO, a river formed by the union of the Idenburg and Rouffaer rivers, is the lower portion of the largest drainage system of New Guinea. The system drains the Lakes plain, a depression parallel to the main axis of the island, and the surrounding mountains, the Idenburg and Rouffaer converging in a large wild sago swamp; from their junction the Mamberamo flows northward for approximately 130 mi. to the sea. Its first 20 mi. are placid, but the river then cuts through the Van Rees mountains in a series of rapids and gorges. Its lower course is navigable for large vessels, but the only settlements consist of native villages. (D. W. F.)

MAMBO, an offbeat rumba done to music in 4/4 time. It derives much of its excitement and colour from the use of brass and percussion instruments. In dancing the mambo, a step is taken on the fourth beat and held through the first beat, followed by a break (stepping forward, backward or sideward) on the second beat, and stepping in place on the third beat. Although the mambo foot patterns and breaks are essentially the same as in the more conservative rumba, the mambo is much freer in style.

The related cha-cha evolved from a rhythmical innovation done on the mambo offbeat to its present form as done on the downbeat. In dancing the cha-cha a step is taken forward or backward on the first beat, followed by a step in place on the second beat, followed by three steps (a ball change) forward, backward or sideward on the third and fourth beats. (B. We.)

MAMELI, GOFFREDO (1827–1849), Italian poet and patriot of the Risorgimento, was born of a noble Sardinian family in Genoa on Sept. 5, 1827. A student of philosophy and law, he became an enthusiastic advocate of the ideas of Giuseppe Mazzini (one of his mother's admirers) and began to write patriotic poems. These included a hymn to the brothers Attilio and Emilio Bandiera (*q.v.*) and the poem "Fratelli d'Italia" (1847), which was set to music, sung throughout the wars of the Risorgimento and eventually made the Italian national anthem. He served the volunteers against the Austrians in Lombardy in 1848. ITALIAN INDEPENDENCE, WARS OF) and met Mazzini in Milan. Having gone to Rome after Pope Pius IX's flight to Gaeta, Malva on Feb. 9, 1849, sent the famous summons to Mazzini on the

lamation of the Roman republic: "Roma! Repubblica! Venite!" Defending Rome with Garibaldi's forces (in which he refused a captaincy because of his lack of experience), he was wounded on April 30 and again on June 3 and died in the Pellegrini hospital on July 6, 1849. His writings were edited by A. Codignola in 1927.

MAMELUKE (Arabic *mamluk*, "owned"), the name given to white male slaves, chiefly Turks and Circassians, from Russia, the Caucasus and central Asia. Mobile and reliable soldiers, they were brought in by the caliphs of Baghdad to compensate for the military inadequacies of the Arabs and Persians. They progressively encroached upon the government until they became masters of the state and formed a military ruling caste.

The Fatimid sultans who governed Egypt from 969 to 1171 enlisted Mamelukes to free themselves from dependence upon north African and Sudanese troops. Saladin, who succeeded the last Fatimid, was himself a free Kurd, but he and his successors employed Mamelukes who were to form the spearhead of the Muslim resistance to the crusaders. Turanshah, the last free sultan, was followed by two Mameluke dynasties, the Bahri (1250-1382) and the Burji (1382-1517). The Mameluke sultans included Egypt, Cyrenaica, Syria, the Hejaz and northern Nubia within their dominions. Their politically chaotic, if culturally brilliant, regime, which endowed Cairo with some of its finest monuments, was overthrown by the Ottoman sultan Selim I in 1516-17. Under Ottoman governance the Mamelukes were retained as local governors, but by the 18th century they had recovered much of their former power and overawed the Ottoman governors general. They were finally destroyed by Mohammed Ali Pasha in a massacre in 1811. In Iraq the province of Baghdad was ruled by Circassian Mamelukes from 1749 until their elimination in 1831. See EGYPT: *History: Medieval Period*; see also references under "Mameluke" in the Index.

Gaudetroy-Demombynes, *La Syrie à l'époque des Mamlouks* (1923); S. H. Longrigg, *Four Centuries of Modern Iraq* (1925); D. Ayalon, *Gunpowder and Firearms in the Mamluk Kingdom* (1956). (R. L. HL.)

MAMERTINI, so called from the Sabellian war god Mamers, were Campanian mercenaries hired from Italy by Agathocles (*q.v.*) of Syracuse. They seized the Greek colony of Messina (Messina) at the northeastern corner of Sicily (*c.* 288), settled there and plundered the surrounding country. Attacked by Hieron II of Syracuse (*c.* 265) they appealed to the Carthaginians, who sent a Punic garrison. Later they changed their minds and appealed to the Romans, thus providing the immediate cause for conflict between Rome and Carthage (264). On the Roman conquest of Sicily the town secured independence under treaty. The inhabitants were still called Mamertines in the time of Strabo, writing in the late 1st century B.C. (R. ME.)

MAMERTINUS, CLAUDIUS (fl. *c.* A.D. 360), Roman official, was the author of a panegyric on the emperor Julian delivered at Constantinople in A.D. 362 in the form of a *gratiarum actio* (thanksgiving) for the orator's elevation to the consulship. Mamertinus had already held high office under Julian's patronage, and later he was governor of Italy, Africa and Illyria under Valentinian I, but his career was terminated in A.D. 368 by a charge of embezzlement. Two earlier speeches in the collection of *Panegyrici Latini* (see below) are ascribed in certain manuscripts to a Mamertinus who cannot possibly be identified with Julian's Claudius Mamertinus. These were delivered, probably at Trier, in honour of the emperor Maximian; the first, probably in A.D. 289, on the anniversary of the foundation of Rome, the second, a birthday panegyric, in A.D. 291. All three speeches are important historical documents for their periods.

See W. Baehrens (ed.), *XII Panegyrici Latini* (1911); E. Galletier, *Panegyriques latins*, vol. iii (1955) and vol. i (1949) in which the two panegyrists are discussed respectively. (W. S. MS.)

MAMMAL, the name for any of the backboneed animals in which the young are nourished with milk from special milk-secreting organs (mammariae) of the mother. They constitute the vertebrate class Mammalia. Mammals are warm-blooded and typically have hair. The word "animal" is often used improperly

as a synonym for "mammal," but animal (*q.v.*) properly refers to any living organism that is not a plant.

 1. Prototheria
 2. Allotheria
 3. Theria

I. GENERAL FEATURES

Mammals, about 3,500 known species of which are living, exhibit an extraordinary range in form, size and habits. Typical mammals, *i.e.*, those best exemplifying mammalian features, include man, dog, cow, rabbit and mouse. Among the less typical are the fishlike whale and seal, the birdlike bat, the plated armadillo and pangolin and the egg-laying duck-billed platypus. In size mammals range from a tiny bat or shrew scarcely larger than a bumblebee to the great blue whale, which reaches a length of 100 ft. and a weight of more than 175 tons. (The largest land mammal that ever lived was *Baluchitherium*, a gigantic hornless rhinoceros, from Oligocene and Early Miocene times, which stood 16-18 ft. high at the shoulders.)

The class is world-wide in distribution, and its members have exploited a variety of ecological niches. It has been said that mammals have a wider distribution and are more adaptable than any other single class of animals, with the exception of certain lower forms such as the arachnids and insects. This versatility in exploiting the earth is attributed in large part to the ability of mammals to regulate their body temperatures and internal environment both in excessive heat and aridity and in severe cold.

Besides milk glands, many other features are diagnostic or characteristic of mammals. Hair (*q.v.*) is a typical mammalian feature, although in many whales it has secondarily disappeared except in the fetal stage. The lower jaw is hinged directly to the skull, instead of through a separate bone (the quadrate) as in other vertebrates. A chain of three tiny bones (hammer or malleus, anvil or incus, and stirrup or stapes) transmits sound waves across the middle ear. A muscular diaphragm separates the heart and the lungs from the abdominal cavity. Only the left aortic arch of the primitive fourth pair persists; in birds the right arch persists, and in lower vertebrates (reptiles, amphibians and fishes) both arches are retained. Mature red blood cells in all mammals lack a nucleus; all other vertebrates have nucleated red blood cells.

Except for the echidna and the duck-billed platypus (see *Monotreme*), which lay eggs, all mammals are viviparous: in man, the dog and the elephant, as examples of placental mammals (Eutheria), the young are carried to a high state of development before being born; in the pouched mammals (see *Marsupial*), such as the kangaroo, opossum and wombat, the young are incompletely developed at birth and are afforded shelter and nourishment within the mother's pouch.

II. NATURAL HISTORY

1. Locomotion.—Mammals, like other tetrapods, are provided with two pairs of limbs used primarily for locomotion, although

ADAPTED FROM A. S. ROMER "THE VERTEBRATE BODY," 3RD EDITION, W. B. SAUNDERS COMPANY, 1962

FIG. 1.—DIAGRAMMATIC FAMILY TREE SHOWING THE EVOLUTION AND RELATIONSHIP OF THE MAJOR GROUPS OF ANIMALS

they may secondarily become specialized for other purposes, as have the forelimbs of man, for example. Limbs may be lost, as happened to the hind limbs of whales and sirenians, but no mammal has ever had more than the typical two pairs of limbs.

In amphibians and reptiles the body is slung between the sprawled limbs (fig. 2). This is a relatively inefficient arrangement for locomotion on land, not much different from the position of the paired fins in fishes. Such animals habitually rest with the belly on the ground; they are incapable of sustained locomotion and move by crawling. In the extinct mammallike reptiles the limbs gradually shifted to a more favourable position beneath the body, the typical position for mammals. In this position the limbs can support the weight of the body with a minimum of fatigue, and can swing fore and aft in pendulum fashion in walking or running.

The locomotor apparatus of mammals is typically adapted to walking or slow running on open ground. Generalized mammals still progress in this way—small rodents, many carnivores, most insectivores. But during the course of their evolution mammals have invaded all three of the major environments—land, water and air—and their limbs have undergone great adaptive radiation in each of these environments. Several distinct types of locomotion may be recognized, each of them being derived from the primitive walking type.

Walking and Running-Walking.—This mode of locomotion is

FIG. 2.—THE SPRAWLING POSITION OF THE LIMBS IN A REPTILE COMPARED WITH THE UPRIGHT POSITION IN A MAMMAL

used by the hedgehog or the rat, in which the legs are of moderate length, well angulated at elbow and knee, and the hands and feet are each provided with five toes. The entire palm and sole are in contact with the ground (plantigrade posture). The legs are moved in an alternating sequence that leaves at least two feet in contact with the ground at all times; thus equilibrium is always stable.

Cursorial.—Sustained high-speed locomotion, as seen in horses and dogs for example, is associated with certain modifications in the limbs. The long, rod-like lower segments increase the length of stride and increase stability. The area of the foot that is in contact with the ground is reduced to a minimum to reduce friction, and the leg muscles are bunched toward the shoulders and hips in order to reduce the weight that must be swung as the leg is moved. Cursorial mammals stand and walk on their toes (digitigrade posture), and there is a strong tendency toward reduction of the number of toes. In the perissodactyls the middle (third) toe becomes dominant; in the horses finally it is the only functioning digit. In the artiodactyls the two middle (third and fourth) toes become dominant; in many artiodactyls, such as deer and cattle, they are the only functional digits. Cursorial mammals use various gaits when moving fast—the trot, the pace or the gallop.

Leaping.—Leaping locomotion occurs in several unrelated groups of mammals living on plains and open deserts: rabbits and hares, jerboas, kangaroo rats, kangaroos. The hind legs, particularly the lower segments, are much enlarged and strengthened. As in cursorial forms, the lateral toes tend to disappear. The hind legs move simultaneously to catapult the body through the air. In highly developed leapers the forelegs are no longer used for support, the animal resting on its hind legs with the tail forming the third leg of a tripod. During leaping the tail acts as a rudder to help maintain balance. From a mechanical standpoint this is a very inefficient and exhausting mode of locomotion.

Bipedal Walking.—This is the typical mode of locomotion in birds, but true bipedal walking, consistently employed, has been developed only once among mammals—in man. Gibbons are bipedal on the ground, but this is an unnatural form of locomotion because they never voluntarily descend to the ground. In bipedalism the whole body is held erect in the vertical position; consequently the structure of the entire body is profoundly affected by the new stresses and strains brought to bear. Most of the peculiarities of the human body can be attributed to man's upright posture. Bipedalism is not an efficient mode of locomotion; a great deal of energy is wasted in simply maintaining equilibrium.

Climbing.—Most small mammals with well-developed claws are able to climb trees and vines merely by digging their claws in, the typical mode of locomotion in squirrels. Larger, heavier mammals cannot rely solely on their claws, and either embrace the support (bears, porcupines) or have prehensile fingers for grasping it (primates). Extreme specialization for climbing leads to brachiation, as seen in certain monkeys, in gibbons and in the orangutan, where

the body is suspended from the arms and swung like a pendulum. In these forms the arms are greatly elongated, and the thumb is reduced so that the hand forms a hook.

Swimming.—Swimming types have evolved independently among several orders of mammals, and not all have solved the problems of aquatic locomotion in the same way. There is always a tendency for the legs to shorten, the hands and feet to broaden, the external ears to disappear and the nostrils to move up toward the top of the head. In whales and sirenians, the most aquatic of mammals, the tail is used for propulsion, the forelimbs are developed into flippers used for steering and maintaining equilibrium and the hind limbs have disappeared completely. Sea lions use the front flippers for propulsion, seals the hind flippers; in both the tail is vestigial. Otters swim by wriggling the whole body and tail in snake fashion; the legs are used only for steering and braking. Aquatic rodents (e.g., beavers, muskrats) use the hind legs largely or exclusively for propulsion, folding the forelegs close against the body.

Aerial.—Two kinds of aerial locomotion have been developed among mammals: parachuting and true flight. Parachuting or gliding requires only a fold of skin stretched between front and rear legs on each side of the body. This simple device was evolved independently in the flying phalangers, flying lemurs and flying squirrels. True flapping flight demands much more extensive modification of not only the limbs but almost the entire body, and has been developed only once in the Mammalia—in the bats. The wings of bats are enormously enlarged hands and forearms, which support a thin membrane of skin; the hind legs are weak and cannot be used for walking.

Speed of Mammals.—Horses, racing dogs and human athletes can easily be timed over measured courses, but most records of the running speed of wild mammals are based on speedometer readings taken when an animal happened to be running parallel to an automobile. Scattered records, compiled by A. B. Howell in 1944, are the basis for the following table. Other sources may differ.

Maximum Running Speeds of Mammals
(m.p.h.)

Man (for 220 yd.) . . .	22.5	Jack rabbit . . .	40
Horse (for 3/4 mi.) . . .	42.3	African elephant . . .	25
Dog (whippet) . . .	34	Giraffe . . .	28-32
Wolf . . .	28	White-tailed deer . . .	30
Coyote . . .	40	Pronghorn . . .	55-60
Cheetah . . .	65-70	Bison . . .	32

2. Social Life.—It is axiomatic that no species of mammal can lead a completely solitary existence, since contact between the sexes at mating, and between mother and young during the period of nursing, are unavoidable if the species is to survive. Such fleeting contacts between individuals are an elementary form of social life, and in some mammals this is the total of social existence—the sexes become antagonistic a few minutes after mating, and mother and young are associated only as long as they are together in the nest. From this rudimentary level, social structures of increasing complexity may be traced, through family, group and herd up to the involved composition of human societies.

Socialization.—If human societies are omitted from consideration, the social life of mammals appears extremely simple compared with that of the social insects (q.v.). Nowhere is there a caste system or any other division of labour except the most elementary one of group leader. Co-operation to build structures for common use, so general among the social insects, is singularly rare among mammals. Co-operation to ensure a common store of food is almost unknown. Socialization in mammals appears to be directed toward reducing the likelihood of disaster to the individual, rather than toward enhancing the effectiveness of the individual through co-operation within the group. Emphasis is on the welfare of the individual, whereas in the social insects the welfare of the group is paramount to that of the individual. The social life of mammals is far less stereotyped than that of social insects—or of other vertebrates, for that matter—depending to a much greater extent on individual intelligence and initiative. Such a system is therefore more adaptable to new or changing situations.

The bonds that hold a group together are not instinctive but are

learned at an early age by each individual. This period of "primary socialization" is brief, after which it is difficult or impossible to change the pattern. The cues to which the animal becomes conditioned apparently involve all the senses. Normally during this period the young animal is integrated into its own group, but it may be experimentally conditioned to reject its own kind in favour of some other species to which it was exposed during the critical period of primary socialization. The period of primary socialization is longer in mammals than in other animals; it lasts only a few days in birds, whereas in dogs it occurs over several weeks and in higher primates several years.

Communication.—Any form of social organization depends upon communication of mutually understood signals between individuals constituting the group. These signals may be vocal, visual, olfactory or tactile. All four are in use among mammals, but their detailed significance, the extent to which they constitute "languages," is little understood.

Voice is the commonest means of communication among mammals. The vocabulary of sounds, and the effect of each on other members of the group, has been studied in detail for very few species. It is evident, however, that in such diverse forms as the California ground squirrel and the howling monkey there is a definite vocabulary of stereotyped sounds, and that individuals react to these sounds in predictable and consistent ways. Visual communication is less common. The "rump patches" of erectile white hairs in the pronghorn, which are displayed when the animal is disturbed, are a visual alarm signal to other individuals. In some groups, notably the carnivores and primates, there are repertoires of stereotyped facial expressions that seem to convey specific meanings to other members of the group; these grimaces may indicate the emotional state of the individual. Scent is often important in individual recognition, in group recognition and in marking out individual territories into which other individuals are reluctant to trespass.

Family Groups.—The relatively long period of immaturity in most mammals, and the resultant need for protecting the young, make the family a natural unit of social organization. At its simplest, such a unit consists of mother and young, as in many rodents. This kind of relationship is dissolved as soon as the young mature. A permanent "marriage" between a male and female is a more stable social structure; such relationships are common among carnivores. Where the young mature very slowly, as in the higher primates, family groups may be quasi-permanent troops of a dozen or more individuals, from which the young are expelled as they mature. Such troops are usually sharply structured, with rigidly enforced systems of social hierarchy. There is rarely more than one mature male, who is the leader and defender of the troop, but there may be several mature females.

A beaver colony likewise consists of a family group, typically composed of one adult male, one adult female and the young of the present and the previous year. Only the colony occupies a pond, and the young are driven away as they mature. Beavers are unique among nonhuman mammals in showing co-operation for the common good in the construction and maintenance of dams and in the gathering of food.

Prairie dog "towns," on the contrary, are less organized than they appear to be. Although prairie dogs are gregarious, there appears to be little or no definite social organization or co-operative activity.

Breeding Aggregations and Herds.—Certain mammals, notably seals of various species, congregate in great numbers during the breeding season, when social organizations of considerable complexity may be formed. Where most elaborately developed, the breeding and nonbreeding animals separate and form separate temporary colonies. In the breeding colony each bull forms a harem of pregnant and virgin cows (numbering up to 30 in the elephant seal), which he jealously defends against other bulls. Each bull marks out a territory on the crowded beach, into which his cows are herded and which he defends fiercely. After the young conceived the preceding year are born and mating has again taken place, the harems break up.

Many plains animals tend to aggregate in herds that, in some

cases, reach vast proportions, which was formerly true of the American bison, for example. The composition of such herds varies in and out of the breeding season. During most of the year the males are either solitary or form loose bachelor herds and the females and young form separate herds, each under the domination of a female leader. During the breeding season the males join the female herds temporarily, each male usually forming a harem of several females.

Care-Dependency Relationships.—Unselfish or self-sacrificing actions, with no direct benefit to the individual, can be attributed only to the human species; it is given a high score on the scale of ethical values, but it may or may not be biologically justifiable as furthering species survival. Among all the other groups of mammals behaviour likened to the altruistic behaviour of man has always been traced to a purely biological motive, based on instinct or learning. Mutual care is commonly seen among monkeys and other primates that groom one another, examining the fur for parasites and other foreign matter; mice often exhibit a similar mutual grooming behaviour.

Among mammals, care-giving behaviour is commonly displayed by a mother providing for and defending her young. In highly socialized mammals, such as the higher primates, certain ungulates and canids, the males may participate in defense and may even take over the major responsibility. Among gregarious monkeys, the macaques and baboons, for example, an alarm cry from any member of the group brings an adult male promptly to the trouble spot. Instances of dogs remaining at the side of a wounded comrade or master are common, and there are authentic records of elephants assisting or transporting a mortally wounded comrade for some distance. Some mammals combine not only for mutual defense and care giving but also for aggression, as in the wolves and dogs and in certain primates. See ANIMAL BEHAVIOUR; PSYCHOLOGY, COMPARATIVE; SOCIOLOGY, ANIMAL.

III. FORM AND FUNCTION

In many ways mammals differ more from reptiles, their closest living relatives, than reptiles differ from the most primitive of living vertebrates, the fishes. (Even birds are more similar to fishes than they are to mammals.) The transition from reptile to mammal was, in fact, more of a revolution than an evolution. These revolutionary changes are especially evident in the structure of the head, but they can also be seen throughout the body. The anatomy of mammals is basically that of other vertebrates, but each of the anatomical systems shows features resulting from the "mammalian revolution."

1. Skin and Hair.—The most characteristic feature of the integument of mammals is hair, a structure found nowhere else in the animal kingdom. Hair serves the double function of insulating the body and protecting the skin against mechanical injury. Naked mammals such as whales and sirenians, which show only vestiges of hair, came from hair-covered ancestors. The skin of most mammals is well supplied with sweat glands (milk glands are modified sweat glands) and sebaceous or "hair sheath" glands that produce an oily substance. (See HAIR; SKIN.)

2. Skeleton.—*Skull.*—The skull, in particular, has been radically altered. Reduction in the number of elements making up the jaw and transformation of some of these into ear bones is mentioned below (see *Evolution and Relationships*). Several of the bones making up the brain case have also been eliminated in mammals: the tabulares, supratemporals, postorbital, postfrontal and prefrontals. A secondary bony palate has developed, separating the air passage from the food passage in the mouth and making it possible for mammals to chew and breathe at the same time. The bony elements surrounding the inner ear have been consolidated into a single bone, the periotic, which fuses with the squamosal. (See SKULL.)

axial and Appendicular Skeletons.—In the vertebral column the most characteristic mammalian feature is the fact that mammals typically have seven neck vertebrae; the only exceptions are the manatee and certain sloths, in which changes in the first pairs of ribs have secondarily altered the apparent number of cervical vertebrae. The shoulder girdle of the majority of living mammals is

much simpler than that of reptiles, some elements having been eliminated and others consolidated so that the mammalian girdle consists only of a scapula (shoulder blade) and clavicle (collar-bone). In the monotremes, on the contrary, the shoulder girdle is essentially reptilian. The bones of the pelvis and limbs have undergone less conspicuous changes than has the shoulder girdle. (See SKELETON, VERTEBRATE.)

3. Dentition.—One of the most important characteristics of the Mammalia is the differentiation of the dentition into four kinds of teeth: incisors, canines, premolars and molars. This differentiation had already taken place in the more advanced mammallike reptiles, and was doubtless associated with the more efficient handling of food required by a higher rate of body metabolism. The incisor-canine-premolar-molar plan is a fixed pattern within the Mammalia, and is therefore a useful tool in classifying mammals.

The dentition of any species can be conveniently expressed by means of a formula. Since the two halves of each jaw are mirror images of each other, only one-half need be included in the formula; the total number of teeth is twice the total of the formula. For example, *Amphilestes*, a Middle Jurassic triconodont, had 4 incisors, 1 canine, 4 premolars and 5 molars in each half of each jaw (a total of 56 teeth). Its dental formula is written:

$$\begin{matrix} 4 & 1 & 4 & 5 \\ I & C & P & M \\ 4 & 1 & 4 & 5 \end{matrix}$$

In therian mammals (all extant mammals except monotremes) the pattern of differentiation has been carried still further. The full marsupial dentition, as seen in the opossum (*Didelphis*) is 5 incisors above and 4 below, 1 canine, 3 premolars and 4 molars—a total of 50 teeth. The full placental dentition, as seen in the European mole, for example, is 3 incisors, 1 canine, 4 premolars, and 3 molars; and since each tooth has a fixed position in the row, it may be assigned a number that identifies that particular tooth in all placental dentitions. The dental formula for the mole, and the primitive one for the Eutheria with the full complement of 44

$$\text{teeth is then: } \begin{matrix} 1 & 2 & 3 & 1 & 2 & 3 & 4 \\ I & C & P & M & I & C & P & M \\ 1 & 2 & 3 & 1 & 2 & 3 & 4 \end{matrix}$$

Very few placentals have the full placental dentition, various teeth having been lost during the adaptive radiation of mammals (see below). The formula may be written to show which teeth have been lost in a particular species. Such a formula for man,

$$\text{with 32 teeth, is: } \begin{matrix} 1 & 2 & 3 & 1 & 2 & 3 & 4 \\ I & C & P & M & I & C & P & M \\ 1 & 2 & 3 & 1 & 2 & 3 & 4 \end{matrix}$$

the dots indicating that the third incisor and the first two premolars in each jaw have been lost. The corresponding formula for the rat, which like other rodents has a single huge chisel-like incisor (the second of the original three incisors) followed by a toothless gap in each jaw, is: $\begin{matrix} 1 & 2 & 3 \\ I & C & P & M \\ 1 & 2 & 3 \end{matrix}$, totaling 16 teeth. On the basis

of the primitive placental mammalian cusp pattern (three cusps arranged in a triangle) the American paleontologist E. D. Cope developed his "tritubercular theory" and H. F. Osborn proposed a system of naming the cusps for consistency in the study of dentition.

Each lower molar has, in addition to the primary triangle, a basin-like heel (called the talonid), into which the innermost cusp of the upper molar fits (fig. 3). In many of the more specialized mammalian dentitions a fourth cusp appears on the tongue side of the upper molars, in a new area called the talon, producing a square tooth. (See TEETH.)

The primitive type of therian dentition, as seen in the opossum and generalized insectivores, has undergone extensive change

FIG. 3.—PRIMITIVE CUSP PATTERNS ON MAMMALIAN MOLAR TEETH: (LEFT) LEFT UPPER MOLAR; (RIGHT) LEFT LOWER MOLAR

among the various orders of mammals. At one extreme, the cheek teeth (premolars and molars) of certain rodents have become so complex that it is almost impossible to identify the cusps of the original tritubercular pattern. In the toothed whales the number of teeth tends to increase, some species having nearly 250. At the other extreme, the whole dentition has disappeared in the toothless whales and in the anteaters and pangolins. For the most part, modifications of the original tooth pattern are closely associated with food habits, for teeth are primarily tools for the seizing and mechanical processing of food. Man and most other omnivorous primates have the cheek teeth square and provided with rounded cusps for crushing. In strict flesh eaters, such as the cats, the functional cheek teeth are reduced to one in the upper jaw and one in the lower; on these teeth the cusps are in line and interconnected by sharp crests to form a pair of shears that can only cut. In herbivorous mammals, such as horses, cows and many rodents, the cheek teeth tend to become long, flat-crowned structures, provided with transverse enamel ridges on the chewing surface, that operate like millstones in grinding plant fibres. Mammals that habitually feed on grasses and other plants containing silica, which is extremely abrasive and wears teeth down rapidly, are faced with the problem of making the teeth last for the normal life span of the individual, since teeth normally do not grow once they have erupted. In some mammals, certain hoofed mammals and many rodents, for example, this problem is solved by having the teeth continuously grow up from the root, thus replacing what is worn off. In elephants the same problem is solved by having only one tooth in each jaw in function at a time, with new teeth erupting successively in the rear and moving forward to replace the one that is worn out. This is continued until the full complement of teeth has been used up, after which no more teeth are available and the animal may starve. Exclusively fish-eating mammals, such as certain whales, have the teeth reduced to a row of simple conical pegs in each jaw. Such teeth, which resemble the undifferentiated teeth of reptiles, actually are a secondary simplification of typical mammalian teeth, no closer to reptile teeth than are the teeth of any other mammal.

4. Muscular.—The muscular system in all lower vertebrates, including birds, is so similar that individual muscles can be homologized (compared as being derived from a common ancestral form) with certainty all the way down the scale to the sharks. In mammals this is no longer true: the plan and organization are the same as in other vertebrates, but details of the individual muscles are so different that it is often impossible to homologize them with their counterparts in reptiles. This is particularly true of the head, where the jaw muscles have been so revolutionized in mammals that they cannot be identified by the same names that are used for all other vertebrates. (See **MUSCLE** and **MUSCULAR SYSTEM**.)

5. Nervous System.—*Brain.*—The mammalian brain is characterized by great development of the outer layer, or cortex, of the cerebrum. The cerebral cortex is the seat of psychic or associative functions, as contrasted with the control functions of the more primitive parts of the brain. The cerebral cortex is often referred to as the neopallium, or new cortex, as opposed to the archipallium, or old part of the forebrain. In man, where it is best developed, the neopallium is larger than all the rest of the brain.

Information as to environmental conditions is continually being received by the numerous receptors of the body. In mammals all, or nearly all, of this information is fed along a widely ramifying nerve network into the cerebral cortex, which thus contains a continually changing picture of the environment. The cortex then acts like a vast computing system, relating input information to past experience in order to devise a response that is most likely to lead to the survival, or comfort and welfare, of the organism. Thus in mammals, in contrast to all other vertebrates, almost every act of the individual is influenced to some degree by the cerebral cortex. The individual mammal is able to profit by experience, to learn, to a far greater degree than other animals can. The behaviour of mammals is thus less instinctive than is the behaviour of other animals. The ability to reason (here defined as the faculty to solve complex problems by means other than trial-and-error procedure) appears sporadically and weakly in some lower mammals, is more highly developed in the primates and

reaches its fullest flowering in man. The primates and man are also the most rapid learners.

The brain is relatively larger in mammals than in other vertebrates, but the actual size of the brain varies enormously among mammals (see table). The brains largest in actual size are found

Brain Weight in Mammals
(Ratio of brain weight to body weight)

Indian elephant . . .	1 : 560	Dog	1 : 118
Dolphin	1 : 432	Macaque	1 : 71
Pilot whale	1 : 400	Man	1 : 50
Domestic sheep . . .	1 : 254	Marmoset	1 : 28
Rat	1 : 208	Spider monkey . . .	1 : 21
Leopard	1 : 168		

in whales and elephants; some of the small monkeys, however, have brains largest in relative size, many being relatively much larger than that in man.

Casts of the brain cavity of the skull give an accurate picture of the size and shape of the brain. The brain casts of many fossil mammals show that in the more progressive stocks there was a steady increase in the size and level of development of the brain. In the horse line, for example, the brain of the earliest horse (*Hyracotherium*) was at about the level of development of the opossum. (See **BRAIN**; **NERVOUS SYSTEM**; **NEUROLOGY**, **COMPARATIVE**.)

6. Circulatory System.—In reptiles and other lower tetrapods oxygenated blood coming from the lungs is more or less mixed in the heart with de-oxygenated blood coming from the body circulation. In mammals (as in birds) the heart is a four-chambered double pump, and there is no such mixing of blood: in mammals the left half of the heart handles only oxygenated blood, the right half only de-oxygenated blood. This complete separation of systemic and pulmonary circulations represents an enormous increase in metabolic efficiency, which is intimately associated with maintaining a high constant body temperature. This efficiency is further increased by the fact that the red blood cells are much smaller and more numerous in mammals and birds, which greatly increases the combined total surface available for gas exchange. The significance of nonnucleated red blood cells, which are found only in mammals, is unknown.

That the left aortic arch is retained in mammals, whereas in birds the right arch is retained, is no doubt a historical accident but it emphasizes the deep-seated differences between mammals and birds, which arose from quite different reptilian stocks. There is no reason for believing that one arrangement of the arches is more efficient than the other. (See **BLOOD**; **CIRCULATION** of **BLOOD**; **CIRCULATORY SYSTEM**.)

7. Respiratory System.—The respiratory system in mammals consists of paired lungs suspended in separate pleural compartments on either side of the heart. An adequate and rapid supply of air is required for the maintenance of high body temperature. Air is breathed into paired nasal cavities, partly separated from the digestive system, through openings on the snout called external nares. Nasal structures and lungs reach their greatest development in size and complexity in mammals. The turbinates, highly coiled and provided with olfactory receptors, and the sinuses associated with the nasopharyngeal region are also highly developed. A very efficient suction mechanism operates: a tendinous and muscular diaphragm, which separates the abdominal cavity from the thorax, is pulled down and the rib cage expanded, creating distension of the spongy lungs; air then rushes in through the bronchial system of cartilage-ringed tubes, the bronchi and bronchioles to the finely subdivided cells called alveoli, wherein gaseous exchange takes place with the blood. (See **RESPIRATION**; **RESPIRATORY SYSTEM**, **ANATOMY OF**.)

8. Digestive System.—The features along the gastrointestinal tract are merely further developments of the earlier original structures in other higher vertebrates: esophagus, stomach, small and large intestines, rectum and anus. Among the many remarkable alterations are the specialized stomach types that appear foremost among them being the ruminant (*q.v.*) stomach in chewing mammals. A well-defined buccal cavity is framed by mobile lips; the tongue is the chief bearer of the taste buds. Sal-

So-called four-eyed opossum, order Marsupialia, found in Central and South American jungles

Koalas, marsupials found in limited numbers in Queensland and Victoria, Australia, where they live in eucalyptus trees

Gray kangaroo, marsupial of the plains of New South Wales and open forests of Queensland, Australia

Cuscus, a slow-moving nocturnal marsupial found in the Australoid Indies

Spiny anteater (*Tachyglossus*), order Monotremata, a native of Australia, Tasmania and New Guinea

Duck-billed platypus, a semiaquatic monotreme inhabiting the streams and rivers of southeastern Australia and Tasmania

MARSUPIALS AND MONOTREMES

Common North American mole, order Insectivora. This species, one of the eastern moles, is found in the central plains and the east

Red bat, order Chiroptera, found in North and South America, the West Indies, Bermuda and the Galapagos Islands

INSECTIVORES AND BATS

Short-tailed shrew, an extremely active insectivore common in the eastern United States, lives in fields or among dead leaves on the forest floor

Flying "fox," largest of the bats, is native to Asia, Madagascar, Australia and the West Indies

Red elephant shrew, an insectivore, is a forest-dwelling species of the Congo and Kenya in Africa

Common hedgehog, an insectivore. Its homeland extends eastward from England and Ireland to maritime Siberia, Manchuria and Korea

Baboon mother and young, from the plains of east Africa

Male mandrill. The mandrill inhabits dense forests of west Africa

Langurs, graceful arboreal monkeys common in southeast Asia

PRIMATES

Red-faced usakari from the rain forests of north central South America

Tarsier, found in the equatorial forests of Malaysia and the Philippines

Three-toed anteater, or tamandua, order Edentata. It lives in trees and is found from southern Mexico to Paraguay

Hairy armadillo, or peludo, an edentate. This species inhabits South America from Panama to the Argentine pampas

Pangolin, or scaly anteater, order Pholidota, is native to tropical Asia and Africa

EDENTATES AND RELATED ORDERS

Aardvark belongs in an order of its own, Tubulidentata. It is found only in Africa, south of the Sahara

Three-toed sloth, also called ai, is an arboreal edentate of the Central and South American tropics

Porcupine, order Rodentia, found in the woodlands of northern and western U.S. and most of Canada

Cottontail rabbit, order Lagomorpha. It lives in meadows and other open places near wooded areas throughout North America

White-footed mouse, or deer mouse, a rodent found throughout North America

Jack rabbit, a lagomorph. Technically a hare, it is a native of North America

Golden-mantled ground squirrel, a rodent that lives in open woods or edges of meadows in western North America

RODENTS AND LAGOMORPHS

Muskrat, a North American rodent whose habitat includes fresh-water and brackish marshes, lakes, ponds and watercourses

Short-tailed weasel, found in Europe and Asia. In the northern part of its habitat the weasel grows white fur in the winter

Striped skunk, found in Canada, the United States and as far south as northern Mexico

Raccoon; its habitats are watercourses, lakes and marshes throughout North America

Lesser panda, found in the mountain forests of Szechwan, China, and Tibet at altitudes ranging from 6,000 to 12,000 ft.

CARNIVORES

Common Eurasian otter found from northern Africa throughout Europe and Asia north to the arctic

Indian mongoose menacing a cobra. The mongoose, native to southern Asia, is noted as a natural snake killer

Cape hunting dog of Africa; it is a predator of the brush country south and east of the Sahara desert

Leopard or panther, found in almost all parts of Africa except the Sahara and widely distributed in Asia

Black bear inhabits the wilderness forests of North America from Alaska to central Mexico

Young margay, one of the smaller South American cats that live in forests ranging from Paraguay to Texas

CARNIVORES

Cheetah, purported to be the swiftest animal on foot, lives in Africa south of the Sahara and in parts of Asia

Gray fox, found throughout the United States and ranging south to the northern part of South America

Rhinoceroses, order Perissodactyla, of east African plains (Mt. Kilimanjaro in the background)

Wart hog, a common species of swine (order Artiodactyla) on the plains of Africa

American bison, an artiodactyl once numerous on the western plains of North America, are now confined to government preserves

Grant's zebra and young, perissodactyls from the east African plains

PERISSODACTYLS AND ARTIODACTYLS

Hippopotamus, an artiodactyl now restricted to large rivers and swamps of west Africa

Topi, an African antelope, ranges the arid steppes on the Sahara's southern fringe

Caribou, or reindeer, inhabiting the tundra of arctic Europe, Asia and America. The caribou is unique among deer in that both sexes have antlers

ARTIODACTYLS

Giraffe, one of several subspecies common throughout the African plains

Pronghorn, or "American antelope," found in open plains of western North America, is the only living member of the family Antilocapridae

One-humped camel, native to the near and middle east, is now an entirely domesticated animal

African elephant, order Proboscidea, is the largest of all land mammals

ELEPHANT, HYRAX AND AQUATIC MAMMALS

California sea lions, fin-footed carnivores, among the smaller species of eared seals

Walrus, also a carnivore. This large arctic mammal is found in the northern circumpolar areas

Tree hyrax, in an order of its own, Hyracoidea, is native to forested regions of central and south Africa

White whale, or beluga, order Cetacea, of circumpolar arctic waters

vary glands in the mouth initiate digestion of starches; completion of digestion occurs in the variously coiled intestines. A caecum (the appendix in man) is most highly developed in plant-eating mammals like rabbits and hares. (See DIGESTION; GASTROINTESTINAL TRACT; NUTRITION.)

9. Urogenital System.—The most important excretory organs of mammals are the paired kidneys, highly efficient filters for removing nitrogenous waste products and excess water from the blood. But the skin, with its sweat glands, the lungs and digestive tract also serve important roles in excretion. (See EXCRETION [KIDNEY]; PERSPIRATION; URINARY SYSTEM.)

The reproductive organs are so intimately associated with the excretory (kidney) system that the two systems are often considered together as the urogenital system. In the monotremes there is a cloaca, a common reservoir or vestibule into which the digestive and urogenital systems release their products. Higher mammals have attained a separation of these systems. The external genitalia of marsupial and placental mammals are highly developed: the urethra (which also carries urine) courses through the penis of the male; the erect penis is introduced into the female vagina wherein sperm is ejaculated. Sperm may unite with an egg, and the resulting embryo, except in the monotremes, is nurtured in the uterus in close association with the maternal tissues. See REPRODUCTIVE SYSTEM.

IV. REPRODUCTION AND DEVELOPMENT

1. Courtship and Mating.—Formal ritualized courtship, as occurs for example in birds, is not found among most mammals. Instead, the cyclical periods of heat, or estrus, in the female create receptivity to copulation, thus ensuring mating and continuance of the species. But among the primates, and especially in man, periods of sexual receptivity are not clearly demarked, and courtship, a form of enticement by the male, assumes importance. Adornments and ritual, however, still appear in restrained form. (See COURTSHIP, ANIMAL; SEXUAL BEHAVIOUR; REPRODUCTION.)

2. Gestation and Development.—One of the most characteristic features of placental (eutherian) mammals is the fact that the young develop to a relatively advanced state within the body of the mother. The most important benefit from this arrangement is that, with food supply assured, the development time of the young can be greatly extended. In egg-laying animals, by contrast, the development time is limited by the quantity of yolk that can be stored conveniently in the egg. Lengthened development time seems to be related to the large size and high degree of development of the mammalian brain at birth. The period of intra-uterine development in mammals varies considerably: the shortest period, 12 to 16 days, occurs in the American opossum, a marsupial in which the incompletely developed newborn undergo further development in the mother's pouch; the longest period, about 22 months, is found in the Asiatic elephant. (See GESTATION PERIOD.)

There is, of course, a limit to the number of young that can be carried in the mother's body. Mammals typically produce a small number of young at a birth—one or two in the vast majority of species. The largest litter size among mammals occurs among the primitive Madagascan insectivores, where as many as 20 young may be produced at a single birth.

The developing embryo requires not only elaborate arrangements for protection but also for provision of food and oxygen and elimination of wastes. The embryo is sheltered within the uterus or womb, a typically mammalian modification of the vertebrate oviducts, and is further protected by the amnion, a fluid-filled sac within which the embryo floats (see EMBRYOLOGY AND DEVELOPMENT, ANIMAL: *Vertebrate Development*.) Nourishment reaches the embryo by way of the placenta (*q.v.*), an elaborate structure made up of fetal membranes and the lining of the uterus. The placenta, which contains an intricate network of blood vessels from both the mother and the fetus, allows the interchange of food and waste between mother and fetus. The placenta is shed at birth.

In the monotremes the female reproductive system is typically reptilian. As in reptiles, the intestine and urogenital system open into a common chamber, the cloaca. The two oviducts open into

the cloaca separately, without forming a uterus. The large egg, which receives a shell as it passes down the oviduct, is laid to develop outside the mother's body. (See also EMBRYOLOGY AND DEVELOPMENT, ANIMAL; GROWTH.)

3. Longevity.—Duration of life varies enormously among mammals. Large mammals, such as the elephant, lion, rhinoceros and horse, tend to be longer lived than small mammals, among which the mice and shrews are the shortest lived, but there is no consistent correlation between size and longevity. Man apparently has the greatest potential longevity of any known mammal.

It is important to distinguish between average length of life and potential longevity. Average length of life is the average age at death of all the individuals in a population, whereas potential longevity is the maximum age that an individual can attain. Since very few individuals of any species live as long as they are capable of living, dying from accident or disease rather than of old age, average length of life is always much lower than potential longevity. In man, for example, life expectancy in an American at birth is about 70 years, but potential longevity is thought to be about 115 years. In some species that are heavily preyed upon, such as wild mice, the discrepancy is probably much greater.

Potential longevity can be measured only in captivity, and even in captivity it is difficult to be sure that an animal has lived out its potential life span. Average length of life is much more difficult to determine. Data on zoo animals are almost meaningless, since these animals are carefully shielded against the mortality factors that operate in nature. See LIFE SPAN.

V. DISTRIBUTION

It is obvious that the various kinds of living mammals are not distributed uniformly over the earth's surface. Elephants are found only in Africa and Asia, anteaters only in South and Central America. There are no deer or bears in Africa south of the Sahara. These and many other examples indicate definite discontinuities in the distribution of mammals.

It is also known, from the fossil record, that mammals were not always distributed in the same way that they are today. Elephants were once abundant in North America, and indeed on all continents except Australia. At the beginning of the Tertiary period, horses were present in both North America and Eurasia, but they became extinct in Eurasia about the middle of the Tertiary and completed their evolution in North America, where in turn they became extinct late in the Tertiary. The living wild horses, zebras and asses invaded Asia and Africa only relatively recently, and wild horses in the Americas were brought in by the white man within historic times.

On the other hand, the anteaters have always been American, and deer and bears apparently never did live in Africa south of the Atlas mountains. The fossil record shows that the distribution of mammals varied in time as well as in space. In other words, the present distribution of mammals is unintelligible except in the light of the past. For the broad geographical pattern of mammalian distribution, see ZOOGEOGRAPHY; the ecological factors that influenced mammalian distribution in the past and continue to influence it, are discussed in ANIMALS, DISTRIBUTION OF.

VI. EVOLUTION AND RELATIONSHIPS

Mammals underwent their major evolution, and became the dominant land animals, during the Cenozoic era of the earth's history, which extends in time from the present back to about 70,000,000 years ago. Thus the Cenozoic is popularly called the "Age of Mammals," although mammals actually appeared on the earth many millions of years earlier. The oldest known fossil mammals are from the Late Triassic period of the Mesozoic era about 175,000,000 years ago. Thus more than two thirds of the history of mammals took place before the beginning of the Age of Mammals, during a time when reptiles were dominant. Mammals remained small and insignificant throughout the Mesozoic, but this long early history is an important chapter in the story of mammals because it was during this time that the basic mammalian pattern was produced, the pattern on which depended all future evolution of the class.

1. Origin.—Mammals arose from the Therapsida, an order of reptiles that became extinct early in the Jurassic period. Several lines of therapsid reptiles became increasingly mammallike during the course of their evolution, and the group as a whole is popularly called the mammallike reptiles. The later members of one sub-order of therapsid reptiles, the Ictidosauria, are in fact so mammallike that it is largely a matter of opinion whether they are to be regarded as reptiles or mammals.

Except in rare instances only bones and teeth are preserved as fossils; consequently the exact time during the transition from reptile to mammal, when many important mammalian characters—such as milk glands, hair, diaphragm or loss of the right aortic arch—first appeared, will probably never be known. It is highly unlikely that all these special features appeared at the same time, but rather they must have developed at various times during the evolution of the mammallike reptiles. The dramatic changes in the skeleton, on the other hand, are well documented in the fossil record. One of the most remarkable of these was the acquisition of a completely new joint between the skull and the lower jaw. The bones that form this joint in reptiles (articular and quadrate) were transformed into two of the mammalian auditory ossicles (the hammer and anvil), and a new joint, between the squamosal and dentary, was developed (fig. 4). The German anatomist Carl Reichert in 1837 concluded from a study of the embryology of this region in the skull of mammals that such a transformation had taken place during evolution. His theory was ridiculed by certain anatomists who insisted that such vital functions as chewing and hearing could not have been carried out during such revolutionary architectural changes. But nearly a century later the study of the fossil mammallike reptiles proved that Reichert's theory was correct. Fossil ictidosaurids (e.g., *Diarthrognathus broomi*), discovered in South Africa, have both reptilian and mammalian jaw articulations at the same time, the reptilian quadrate-articular joint not quite gone and the mammalian squamosal-dentary joint already in function. (See also PALEONTOLOGY.)

2. Adaptive Radiation.—In the history of all groups of animals there seem to be brief periods of very rapid evolution during which a number of new major types arise. The resulting major lines then evolve more slowly, most of them eventually becoming extinct, until one or more of the surviving lines again give rise to a new group of major types. The process of a parent stock breaking up into such groups is called adaptive radiation.

There have been four such periods of adaptive radiation in the

FIG. 4.—COMPARISON OF LOWER JAW AND EAR REGION IN THE SKULL OF A REPTILE (ABOVE) AND A MAMMAL (BELOW)

FIG. 5.—RELATIONSHIPS OF THE MAJOR GROUPS OF MAMMALS. KNOWN GEOLOGIC RANGES ARE SHOWN IN DARKER TONE, INFERRED RANGES IN LIGHTER TONE. THE FOUR MAJOR RADIATIONS OF MAMMALS ARE INDICATED BY CIRCLES

history of mammals (fig. 5). The first was the radiation of the mammallike reptiles into a number of subclasses of mammals in the Late Triassic period; only two of these subclasses survive today. A second radiation, of marsupials in the Cretaceous period and Paleocene epoch, produced a great variety of pouched mammals many of which are now extinct. At almost the same time the primitive placental mammals were radiating into a number of major types, most of which became extinct in the Early Tertiary period. Finally, in the Late Paleocene and Early Eocene epochs of the Cenozoic, there was a fourth radiation, that of placental mammals into the modern orders, most of which survive today. There is reason to believe that this last radiation had passed its peak and modern mammals had begun to decline even before the depredations of modern man began. There can be no doubt that mammals have been on the wane everywhere since the introduction of modern firearms and large-scale agriculture.

3. Adaptations.—The earliest mammals were small creatures, probably very similar to small opossums in appearance and behaviour (fig. 6), that occupied a very minor niche among the hordes of reptiles that dominated the land during the Late Mesozoic. They were omnivorous, perhaps largely insect-eating, animals that lived on the ground or climbed in the lower strata of the vegetation. Feet had five toes each, and there was a long and well-developed tail. Like the opossum, these early forms were not highly specialized for any particular way of life that demanded extensive modification of the structural system inherited from the mammallike reptiles.

Once the reign of the reptiles ended at the end of the Cretaceous, the therians began to move into the biological situations that had previously been occupied by the reptiles. Exploitation of these varied situations required modifications, often far-reaching, of the generalized body structure of the primitive mammals. Thus began the adaptive radiation of the Theria, and particularly of the Eu-

theria, into the orders of mammals that survive today.

With few exceptions, each of the mammalian orders represents an adaptation to a particular way of life, to exploiting some special ecological situation. The bats fly in the air, the toothed whales swim in the sea and eat animals, the sea cows live in the sea and eat plants. Rodents are typically quite unspecialized except for their remarkable chisel-like gnawing teeth. Carnivores are equipped for preying on other animals. The hoofed animals are specialized for feeding on leaves and grass and for running at high speed. The scaly anteaters are "machines" for digging out and devouring termites. It is evident that the primary division of the Mammalia into orders involved specialization for particular kinds of feeding or locomotion, or both. The insectivores do not fit easily into this simple scheme because their structural pattern is still almost as generalized as the pattern of the original eutherian mammals. The ecological zone occupied by the primates is less obvious and less restricted than that of other orders; in general most primates are adapted to life in trees and to omnivorous feeding.

The Australian marsupials underwent an adaptive radiation independent of the radiation of eutherian mammals in other parts of the world. In filling the ecological niches of their environment these marsupials have produced counterparts of many of the eutherian types, and in some cases the parallel is astonishingly close.

FIG. 6.—RESTORATION OF A CRETACEOUS INSECTIVORE, ZALAMBDALESTES LECHNEI, ONE OF THE FIRST EUTHERIAN MAMMALS

The marsupial (Tasmanian) wolf is very similar to eutherian dogs and wolves; the marsupial "cats" resemble small cats, weasels and martens; the wombats, phalangers and marsupial "mice" are like woodchucks, squirrels and true mice in appearance and behaviour. There is even a marsupial "mole." The wallabies and kangaroos fill the role played by deer and antelopes in other parts of the world. See ANIMALS, PHYLOGENY OF.

VII. CLASSIFICATION AND SURVEY

The class Mammalia may be divided into three subclasses. Only one subclass, the Theria, is of great importance in the history of the Mammalia as a whole. It is probable that each of the subclasses arose from a separate line of mammallike reptiles, and that the Mammalia is therefore a polyphyletic group. Two poorly known groups of Mesozoic mammals, the triconodonts and docodonts, do not fit well into any of these three subclasses, and when better known may be found to represent separate subclasses of their own.

The major divisions of the Mammalia are as follows:

- Subclass Prototheria, egg-laying mammals
 - Order Monotremata, echidna and platypus
- Subclass Allotheria (extinct)
 - Order Multituberculata
- Subclass Theria, live-bearing mammals
 - Infraclass Pantotheria (extinct)
 - Order Pantotheria
 - " Symmetrodonta
 - Infraclass Metatheria, all the pouched mammals
 - Order Marsupialia, kangaroos, opossum, phalangers, koala, etc.

Infraclass Eutheria, all the placental mammals

Order Insectivora, shrews, moles, hedgehogs, etc.

" Dermoptera, "flying lemur" or colugo

" Chiroptera, bats

" Primates, lemurs, monkeys, apes, man

" Tillodontia (extinct)

" Taeniodonta (extinct)

" Edentata, sloths, anteaters, armadillos

" Pholidota, pangolin or scaly anteater

" Lagomorpha, rabbits and hares

" Rodentia, all the rodents

" Cetacea, whales, dolphins and porpoises

" Carnivora, dogs, bears, weasels, cats, etc.

" Condylarthra (extinct)

" Litopterna (extinct)

" Notoungulata (extinct)

" Astrapotheria (extinct)

" Tubulidentata, armadillo

" Pantodonta (extinct)

" Dinocerata (extinct)

" Pyrotheria (extinct)

" Proboscidea, elephants, mammoths and mastodons

" Embrithopoda (extinct)

" Hyracoidea, hyraxes

" Sirenia, dugong and manatee

" Perissodactyla, odd-toed ungulates including horses, tapirs, rhinoceroses, etc.

" Artiodactyla, even-toed ungulates including pigs, cattle, deer, etc.

The extinct Triconodonta and Docodonta are of uncertain rank.

1. Prototheria.—No ancestral genera of monotremes are known, and the living forms (the echidnas and the platypus) are so specialized that many features, notably the dentition, that are useful indicators of relationships among other mammals are missing or extremely modified. Most modern mammalogists believe that the monotremes arose from a stock of therapsid reptiles entirely different from the stock that gave rise to therian mammals, and therefore that the histories of these two groups have been separate for at least 175,000,000 years. Some students have even denied that monotremes are true mammals.

2. Allotheria.—The multituberculates were small to medium-sized mammals with very peculiar and specialized teeth. The molars were elongate and had many cusps arranged in longitudinal rows; they often resembled miniature ears of corn. The multituberculates arose in the Late Jurassic and survived for about 100,000,000 years, longer than the recorded history of any other order of mammals. Representatives are known from North America, Europe and Asia. The largest multituberculate (*Taeniolabis*) was about the size of a beaver.

Triconodonta.—The Triconodonta were a small order of peculiar mammals that arose in the Late Triassic and survived into the Cretaceous. The relationship between the triconodonts and other mammals is unknown, and they cannot be assigned with certainty to any of the recognized subclasses of mammals. The cheek teeth were very characteristic, of a shearing type, with three main cusps arranged in a longitudinal row, an arrangement found in many therapsid reptiles. Triconodonts were carnivorous and ranged up to about the size of a mouse.

Docodonta.—Small mammals of Jurassic age, differing from all other mammals in that the articular (malleus) and quadrate (incus) bones still formed a subsidiary part of the jaw suspension. Only three genera are known: *Docodon*, from the Late Jurassic of North America, and *Morganucodon* and *Peraicynodon* from the Late Triassic and Late Jurassic, respectively, of Europe. Some students believe the docodonts to be related to the monotremes.

3. Theria.—The therians include all living mammals except the monotremes. In the last great radiations of the class Mammalia, at the end of the Cretaceous and the beginning of the Cenozoic, the Theria diverged into the modern stocks that include the vast majority of marsupial and placental mammals populating the earth today, the three infraclasses Pantotheria, Metatheria and Eutheria.

Pantotheria.—A group of extinct mammals including two orders, the Symmetrodonta and Pantotheria proper. The symmetrodonts arose in the Late Triassic; they in turn gave rise to the pantotheres in the Early Jurassic. Both orders died out during the Cretaceous. In both symmetrodonts and pantotheres the teeth were basically similar to the teeth of later mammals. The pantotheres apparently

were ancestral to modern marsupial and placental stocks. Symmetrodonts differed from pantotheres and from all later mammals in lacking the heel (taloid) on the lower molars.

Metatheria.—This infraclass includes a single order, the Marsupialia, characterized by the presence of a pouch (marsupium) in the female, in which the young develop for some time after they are born. In a few marsupials the pouch is vestigial or has even disappeared completely. Typical marsupials are the opossum and the kangaroo. The marsupials arose in the Cretaceous at about the same time as eutherian mammals; these two groups underwent their early evolution side by side. The marsupials apparently were unable to compete with the more progressive eutherians, and died out except in Australia and South America, where they were isolated from most eutherian competitors by water barriers. At the present time marsupials are found only in the Australian region; in South and Central America; and in North America, where a single species, the American opossum, occurs. All but about a dozen genera are confined to Australia; nearly a hundred extinct genera are known.

Eutheria.—The vast majority of living mammals are eutherian, or placental, mammals that bear their young in a relatively advanced state of development and do not shelter them in a pouch. Man himself is a eutherian. Living eutherians are divided into 16 orders; 10 additional orders are extinct and known only as fossils.

Detailed information on the subgroups of mammals may be found under common and/or scientific names: ARTIODACTYL and ANTELOPE; CATTLE; DEER; CARNIVORE and BEAR, CAT, DOG; EDENTATA and ANTEATER; ARMADILLO; SLOTH; PROBOSCIDEA and ELEPHANT; MAMMOTH; MASTODON; SIRENIA and DUGONG; MANATEE; etc. See MARSUPIAL and KANGAROO; OPOSSUM; WOMBAT; PHALANGER; MONOTREME and ECHIDNA; PLATYPUS; see also references under "Mammal" in the Index.

MAMMARY GLAND, the milk-secreting organ that, together with hair, furnishes the prime distinguishing characteristics of mammals. Such glands are present in both sexes, but in the male the organ is incompletely developed.

Anatomy.—In the human female the breast extends vertically from the second to the sixth rib, and transversely from the edge of the breastbone into the territory of the armpit. A little below the centre of the glandular swelling is the somewhat cylindrical nipple, whose rounded top bears minute pores where the milk ducts open; deep within is involuntary muscle that causes the nipple to erect in response to stimulation. Surrounding the nipple is a pigmented, circular patch called the areola, which is studded with slight nodules produced by from 10 to 15 underlying rudimentary milk glands (areolar glands). During the second or third month of pregnancy the areola darkens, but after lactation ceases, this added pigmentation fades. The glandular mass proper is composed of from 15 to 20 lobes, and these subdivide into smaller lobules that contain the secretory endpieces and lesser, branching ducts. Each lobe is drained by a single excretory lactiferous duct, which swells into a reservoir (lactiferous sinus) and then dwindles again and finds an outlet on the nipple. The endpieces (alveoli)

ADAPTED FROM MORRIS, "HUMAN ANATOMY"

THE BREAST DURING LACTATION. DISSECTED TO SHOW ITS SECRETORY ALVEOLI AND DUCTS

The glands of both sexes remain equal until the approach of puberty. Then the female breast increases suddenly and continues to grow for some time. During pregnancy it augments further and after childbirth still more. Growth is largely (and possibly wholly) a response to the ovarian hormone, estrogen, whereas a pituitary hormone, prolactin, brings about actual secretion. When lactation ceases, the gland returns to approximately its former size. At the end of the childbearing period of life, the glandular tissue atrophies greatly, but compensatory deposition of fat may maintain the size of the breast, which often becomes pendulous. The two breasts are seldom equal in size, the left tending to be somewhat larger. Suppression of a nipple or of the breast itself occurs at times. Supernumerary nipples or even small glands are relatively common; they usually lie along a line that corresponds to the position of the embryonic mammary ridge and represent extra developments from that tissue. Occasionally the male breast will simulate the female breast on one or both sides (gynecomastia).

Embryology.—The mammary glands are highly modified sweat glands; transitional stages are seen in the glands of the areola and armpit. In the sixth week of human development a thickened epidermal band appears in the pectoral region, much less extensive than the axilla-to-groin mammary ridge of many lower mammals. Each future gland begins as a local thickening on this ridge, the remainder of the ridge vanishing. This lens-shaped thickening becomes a globular mass from which 15 to 20 cords grow into the deeper regions of the skin; these cords are the primary ducts and they continue to grow and branch throughout fetal life. The exposed, free surface of the original thickening hollows into a pit and at about the time of birth this area elevates as a nipple, bordered by an areola. The further history, following birth, has been summarized in the preceding paragraphs. Since these glands evolved late in the history of vertebrate animals, it is remarkable that they arise so early in the mammalian embryo.

Comparative Anatomy.—Both the number of glands developed in the different mammalian groups and their locations vary widely. In general, the number corresponds to the number of young ordinarily produced at one birth. This agreement is not always exact, as in evidence are the extra glands of sheep and cattle; moreover, since the glands occur in pairs, the minimal number of two is in excess of single human births. Actually, the number of glands is not entirely constant in individuals of the same species. The position of the glands seems to bear a relation to convenience of suckling. Mammals that have many young at birth, as the sow, most carnivores, many rodents, etc., have as many as 11 pairs of glands distributed along the wall of the underbody. In the pouched mammals (monotremes and marsupials) inguinal mammae are found, and the same is true in most ungulates as well as in the Cetacea. In sloths, elephants, Sirenia, Chiroptera and primates, on the other hand, they are confined to the pectoral region, and this is also the case in some rodents; e.g., the jumping hare. The outcome depends on the development of glands along localized patches of the embryonic mammary ridges, while the

are scarcely recognizable as entities before pregnancy, and the entire gland has a blighted appearance. Connective tissue and fat comprise by far the greatest bulk of the inactive organ. During pregnancy the duct system extends and alveoli appear as minute vesicles, expanding the lobules. During lactation the alveoli become relatively prominent sacs, packed closely together. The secretory cells of the sac wall are cuboidal in shape, and the milk secreted by them collects in the relatively capacious cavity of the sac. The ending of lactation is accompanied by regressive changes that return the gland to the previous inactive state.

intervening parts of the ridges disappear.

In the monotremes a pair of pits within the longitudinal, pouch-like skin fold receive 100 or more separate mammary tubules. Milk is conducted from these openings along hairs, whereupon it is licked off or sucked up by the nursing young. In all other mammals the glands open in relation to nipples. The primary type is a pseudo nipple, as illustrated by the teat of cattle and other ruminants, in which the skin around the openings of the glandular ducts grows upward so as to surround a very deep pit; in the bottom of this canal the glandular ducts open. In the true nipple the gland surface itself is elevated into a papilla, and the ducts then open at its apex. In monotremes the glands are equally developed in both sexes, and it has been thought that among bats the male often assists in suckling the young. These facts, together with the occasional occurrence of functional activity of the organ in the human male, make it probable that among ancestral mammals both sexes participated in lactation and nursing. (L. B. Ay.)

Diseases.—The breast is the seat of various disturbances, all of which are worrisome and some of which are fraught with danger.

Mastodynia.—Mastodynia, or persistent pain in the breast, intensified before the menstrual period, is relatively common in mature women. The pain is often referred to a lump that is tender to the touch. These symptoms usually disappear spontaneously after months or years, but the possibility of infection or cancer must be considered.

Cysts of the Breast.—A galactocoele is a tumour due to the locking up of milk in a greatly dilated duct. Other forms of cystic disease are usually special modifications of chronic mastitis. Such cysts are best treated by free incision, and by passing a gauze dressing into their depths. If the tissue is occupied by many cysts, it is well to remove the whole breast.

Acute Mastitis.—This is a temporary inflammatory condition of the breast. It is apt to occur in a woman who is suckling, and is due to the presence of septic microorganisms, which, as a rule, have found their way into the milk ducts, the lymphatics or the veins through a crack or other wound in a nipple that has been made sore by the infant's vigorous attempts to obtain food. Especially is this septic inflammation likely to occur if the nipple is depressed or so badly formed that the infant has difficulty in feeding from it. The inflamed breast is enlarged, tender and painful, and the skin over it is hot and perhaps reddened. The woman feels ill and feverish, and she may shiver or have a definite rigour if the inflammation is passing on to the formation of an abscess. The abscess may be above or beneath the breast, but it is usually within the breast itself. In the early stages, cold packs and the cessation of nursing may abort the infection. The response to sulfa drugs and penicillin therapy is excellent. If pus collects, applications of heat are administered to localize the abscess, followed by incision and drainage.

Chronic Mastitis.—This condition is not uncommon in women who are past middle age. The symptoms may have been present for months to many years. The part of the breast involved is enlarged, hard and more or less tender and painful. It is sometimes impossible clinically to distinguish this disease from cancer. True, the tumour is not so definite or so hard as a cancer, nor is it attached to the skin, nor to the muscles of the chest wall, and if there are any glands secondarily enlarged in the armpit they are not so hard as they may be in cancer. But all these are questions of degree, and the indications given for a diagnosis of cancer indicate also that the disease is so advanced as to have reduced the chance of successful operation to a minimum. Moreover, it is highly inadvisable to leave it to time to clear up the diagnosis, for a chronic mastitis, innocent at first, may become cancerous, while cancer and chronic mastitis often coexist in the same breast. Hence the only safe course is removal of the breast.

Fibroadenoma.—A simple fibroglandular tumour may be found in the breasts of younger women, who may possibly give an account of some blow or other injury; there may, however, be no history of injury. The tumour is smooth, rounded or oval, and lies loose in the midst of the breast; as a rule it is not tender. It is not associated with enlarged glands in the armpit. The tumour,

though innocent, should be removed promptly, for such growths may enlarge rapidly and become cancerous later.

Cancer.—This is the commonest disease of the breast. It occurs chiefly among women between 40 and 60 years of age, but men are not entirely immune and women older or younger than the ages mentioned may suffer. The early symptoms are given elsewhere (see CANCER), and the later symptoms are those of cancer in general; viz., local spread, destruction of normal tissue, ulceration, early extension to the nearest group of lymphatic glands (in this case, axillary) and from these to neighbouring groups of glands (in this case, supraclavicular) and formation of secondary growths in skin, liver, bones, muscle, indeed in any tissue of the body. With the exception of melanotic sarcoma the secondary growths in cancer of the breast are more widely spread than in cancer affecting any other primary site. Probably this is in part due to the fact that the natural duration (*i.e.*, duration apart from all treatment) of breast cancer is relatively long, viz., about three and a quarter years. The pain and distress are usually great, particularly in the later stages when probably ulceration will have occurred and pressure of the cancerous mass in the armpit on the veins and lymphatics may have led to great swelling of the arm. Death may be brought about in various ways, the immediate cause often being some intercurrent disorder which the patient, enfeebled by absorption of toxic material from the ulcerated surface, anemia and pain, cannot resist; or by extension of the growth to the pleura and lung, with coincident pleurisy and pneumonia.

Cancer of the breast is usually spheroidal cell carcinoma, but the columnar cell type also occurs, notably in so-called "duct carcinoma," which is a less malignant variety. Sarcoma is also met with. Carcinoma is either hard and fibrous (scirrhus) or highly cellular (encephaloid), but many intermediate forms occur even in different parts of the same breast. A scirrhus growth is relatively smaller and runs, locally, a less rapid and extensive course than encephaloid, but as regards extension from the primary focus and the occurrence of secondary growths there is little difference between them. Sarcoma of the breast locally forms a large growth and the secondary growths have a somewhat different distribution. Speaking generally, scirrhus is associated with an atrophied and shriveled breast and retraction of the nipple.

It is often said that cancer runs a more rapid course in the young; statistical evidence does not support this view, though many cases in the very aged progress slowly. On the other hand during pregnancy a cancer of the breast participates in the rapid growth of the organ. But there is no evidence that suckling conduces to cancer; on the contrary, abeyance of the natural function seems to be related to the occurrence of chronic mastitis and consequently to local cancer after a longer or shorter interval.

The treatment of cancer of the breast depends to an overwhelming extent upon the stage at which the disease comes under full and proper treatment. If cancer of the breast is dealt with by the modern complete operation while the growth has not extended beyond the limits of the organ, approximately 90% of the patients are alive and well ten years later and their expectation of life is not materially different from that of women of the same age who have not suffered from cancer. But if the cancer has extended beyond the limits of the gland, a matter of a few weeks from the time when it first becomes recognizable, the case is very different. In spite of the same operative treatment, 90% of the patients will be dead by the end of ten years. No better evidence could be given for the paramount value of early and adequate operation, but the surgeon is dependent upon the patient and there is evidence that about half the number of patients dying with cancer of the breast do not seek medical treatment at all till the last days of life; of the remainder who seek advice, an average period of six months or more has elapsed between their first noticing that something was wrong and consulting a surgeon. There may be many explanations of this delay, but the fact remains that with each hour they have been throwing away a good chance of healthy life.

In cancer of the breast early and complete operation easily

holds the first place for success so far as present knowledge goes. Radium and X-ray treatment, though highly valuable in some other sites, are far inferior to surgery as curative agents in cancer of the breast with the present technique. Possibly it will remain so even with improved technique because of the special peculiarities appertaining to cancer of this organ. Upon this point no confident opinion can be given. When the disease is beyond operative treatment, radiation methods may afford palliative relief. (See CANCER; CANCER RESEARCH.)

Chronic Eczema.—Chronic eczema around the nipple of a woman late in life, with perhaps localized ulceration, is known as Paget's disease and has a sinister significance, for it indicates that the superficial layers of the fibrous dermis are in all probability infiltrated with cancer. Hence, when eczema about the nipple refuses to clear up in a few days under the influence of soothing treatment, the usual recommendation is the removal of the entire breast. The nipple is retracted in most of these cases, which, however, are not often met with.

Bloom, *A Text-book of Histology*, 6th ed. (1952); H. Cummins, section II in H. Morris' *Human Anatomy*, 11th ed. (1953). (W. S. L.-B.; L. B. Av.)

MAMMEE APPLE (MAMEE or ST. DOMINGO APRICOT), the fruit of *Mammea americana*, a large tree of the garcinia family (Guttiferae), with opposite, leathery, gland-dotted leaves; white, sweet-scented, short-stalked, solitary or clustered axillary flowers; and yellow or russet fruit, three to six inches in diameter. The bitter rind encloses a sweet aromatic flesh, which is eaten raw or with sugar, and is also used for preserves. There are one to four large rough seeds, which are bitter and resinous, used as anthelmintics. An aromatic liqueur distilled from the flowers is known as *eau de Créole* in the West Indies. The acrid resinous gum has been widely used locally for destroying skin-infesting chigoe fleas.

MAMMOTH, broadly speaking, any extinct member of the elephant subfamily (Elephantinae), representatives of which occur in Pleistocene deposits of every continent except Australia and, barring one dubious report, South America. Similar to living elephants (*q.v.*) in the body skeleton, mammoths differ from them and from each other in skull shape, tusk form and molar structure. So many are the differences in these body parts and so great is the variation within single species that there is little agreement on how many kinds of mammoths actually existed. There appear to be three major groups to which they may be consigned: one comprises relatives of the African elephants, of which the straight-tusked mammoth (*Loxodonta*, subgenus *Palaeoloxodon*) is the best known; another contains relatives of the Asiatic elephants; and a third, the genus *Mammuthus*, comprises a number of extinct species. The first two groups occur only in the old world; members of the third have been found in southern Africa as well as in southern North America. The North American imperial mammoth (*Mammuthus imperator*) attained a shoulder height of 14 ft. At the other extreme were certain dwarfed forms whose ancestors became isolated on various islands.

The woolly, Northern or Siberian mammoth (*Mammuthus primigenius*) is by far the best known of all mammoths. Knowledge of this animal is derived not only from skeletons but also from carcasses well-preserved in the permanently frozen ground in Si-

beria and from cave paintings, carvings, statuettes and incised drawings made by the Paleolithic men who hunted these beasts. Somewhat smaller than the Asiatic elephant, the woolly mammoth attained a shoulder height of about 9½ ft. The hind quarters were comparatively low, giving a downward slope to the back, and the tusks, larger and more complexly curved than those of living elephants, had the tips growing upward and inward in old individuals. Circumpolar in distribution, the species ranged from western Europe across northern Asia and Alaska to eastern North America occurring very commonly within the Arctic circle. The tusks found in northern Siberia are so perfectly preserved that they have been used industrially; fossil ivory is so abundant that it has been exported from Siberia to China and Europe since medieval times.

All available evidence indicates that the woolly mammoth, like the present-day reindeer and musk ox, was well adapted to the arctic climate. Paleolithic art depicts it as a shaggy animal, completely covered with hair. The frozen carcasses confirm the existence of a woolly, yellowish-brown undercoat, about an inch thick, beneath a coarser, outer covering of dark-brown hair, up to 20 in. long. The fur-covered ears were smaller than those of living elephants, and the short tail ended in a tuft of long, stiff bristles. Under the extremely thick skin was a layer of fat about half an inch deep over most of the body and, in at least one specimen, more than three inches deep on top of the skull. Paleolithic art shows some mammoths with and others without humps on top of their heads and above their shoulders. Very probably both kinds of representation are correct, the appearance of the humps perhaps having been seasonal phenomena, summer deposits of fat that helped sustain the animals through harsh winters. Remains of arctic plants have been found in the frozen carcasses. One of the most complete and most intensively studied mammoth carcasses was that unearthed in 1899 from the bed of the Berezovka river in Siberia. Several less complete remains have been discovered since that time.

MAMMOTH CAVE NATIONAL PARK, established in 1941, provides protection to an extensive system of beautiful limestone caverns in west central Kentucky. These caverns were supposedly discovered in 1809 by a hunter following a wounded bear. They must have been known to exist earlier, however, since the entrance was designated in county records of 1799.

The main cave, entered through the natural Historic entrance about 7 mi. W. of Cave City, Ky., is from 20 to 140 ft. wide and averages about 40 ft. in height. It extends westward through various rooms and passages to its termination about 4 mi. from the entrance. Although the entire cavern spreads beneath an area only 10 mi. in diameter, the main cave and accessible passages, with their domes and chambers, aggregate a length of more than 150 mi. on five levels. One room, the Rotunda, is 139 ft. wide 142 ft. long and 40 ft. high. In it are the remains of a crude processing plant which was used to extract saltpetre, an ingredient of gunpowder, from the bat guano of the cave. During the War of 1812 the cave was almost the only source of saltpetre for the blockaded and powder-poor U.S.

Mammoth cave shows great variety of formation and alteration (see CAVE). It includes extensive gypsum and travertine formations of great beauty to which names such as King Solomon's Temple, Pillars of Hercules, Giant's Coffin and Star Chamber have been given. In the Bridal Altar room, a majestic natural shrine, many weddings have taken place. Underground lakes and streams include Echo river, upon which boats are operated, the River Styx, Lake Lethe and the Dead sea. The Historic entrance to the cave has been supplemented by three man-made entrances. Five subterranean scenic routes have been laid out for the convenience of visitors, who are allowed in the cave only when accompanied by a park service guide.

BY COURTESY OF CHICAGO NATURAL HISTORY MUSEUM

WOOLLY MAMMOTH, FROM A MURAL BY CHARLES R. KNIGHT IN THE CHICAGO NATURAL HISTORY MUSEUM

The temperature of the cavern is fairly uniform at 54° F. (about 12° C.) throughout the year. Within the Historic entrance a draft sweeps outward for most of the year when the exterior air is the warmer; occasionally inward when the exterior air is the colder. The animal life of the cave includes cave crickets with very long antennae, the blind, colourless crayfish and the blindfish or cave fish, one to five inches long, which, through long evolutionary processes, have lost the use of their eyes completely. All the known forms of plant life in the caverns are either fungi or are related to them, many being microscopic. Mummified Indian bodies, possibly of pre-Columbian origin, have been found in Mammoth and other nearby caves.

The park's surface area is more than 51,000 ac. and, as with all U.S. national parks, is a nature sanctuary. Its hills are heavily grown with hardwoods and, although the forest is not primeval, there are numerous trees of great size along the Nolin and Green rivers, tributaries of the Ohio, which traverse the park through deep ravines.

Some of the more important trees are sycamore, tulip, American elm, white ash, sugar and red maple, black gum, shagbark hickory and various oaks. Trees that beautify the area with their blooms in early spring include the serviceberry, flowering dogwood and redbud. Abundant native wild flowers, mammals and birds are of species typical of eastern forests. A museum at park headquarters includes an illuminated map of the cave routes as well as exhibits showing the cave's formation, history, flora and fauna. The park encompasses the Flint Ridge Cave system (*q.v.*).

(Dx. B.)

MAMORÉ, a river of Bolivia formed by affluents rising on the slopes of the Cordillera Real and flowing northward to join the Guaporé river and subsequently the Madeira river. The Mamoré is the central and most significant river in the system of waterways which drain the northern plains region of eastern Bolivia and ultimately converge into the Madeira in the northeastern section of the country. Its complex of affluents includes the Chaparé, originating to the north of the city of Cochabamba, the Isiboro, the Ichilo, the Yapacani and its tributary the Piray and the Río Grande. The latter, also known as the Guapay, rises in the cordilleras of Cochabamba and Sucre. Starting out directly east, the Río Grande then sweeps northward, northwest, and after executing a semicircle for a distance of about 600 mi. unites with the Mamoré a few miles below the confluence of the latter with the Chaparé.

Most of the upper tributaries of the Mamoré are navigable by some type of craft, depending upon the season; consequently, the Mamoré is an important route from the north and east as it provides access to Cochabamba from both Trinidad and Santa Cruz. Fluvial travel from Cochabamba to the lowlands is accomplished by way of the Chaparé, Chimoré and Isiboro, utilizing rafts as far as the confluence of these rivers with the Mamoré, where larger craft are operative. The Mamoré can be descended without difficulty as far as Puerto Sucre, a point about 36 mi. from Villa Bella where the first rapids of the river are encountered. The Amazon river is reached by way of the Madeira and the Madeira-Mamoré railway via Pôrto Velho. The Guaporé river, or Iténez, the largest affluent of the Mamoré, is navigable along its course of 1,000 mi. at any season by vessels of light draft.

Starting from the edge of the mountains to its confluence with the Madeira, the Mamoré flows due north for about 900 mi. passing close by the town of Trinidad midway and absorbing several tributaries as it progresses. The downward slope to the north is so gradual in this section of the lowlands that the rivers are slow, shallow and irregular in their courses. This feature, together with the flatness of the land, results in the inundation of much of El Beni during the rainy season. The Mamoré is 930 mi. long and in part constitutes the northeast boundary of Bolivia and Brazil.

MA'MUN, AL- (ABU-AL-'ABBAS 'ABDULLAH AL-MA'MUN), (786-833), the seventh Abbasid caliph, who reigned from 813 to 833. Second son of the caliph Harun al-Rashid, he was assigned the government of Khurasan by his father (before his death in 809) together with the command of the Khurasanian guard. Differences

over the guard and other matters led to war between al-Ma'mun and his brother al-Amin. With the help of the Iranian general Tahir, al-Ma'mun defeated his brother, who was killed as he fled from Baghdad, and became caliph, though his rule was opposed by his uncle Ibrahim ibn al-Mahdi until he was defeated in 819. Much of al-Ma'mun's caliphate was spent in an attempt to find a fresh balance of forces in which the social and political tensions underlying his personal struggle with his brother and uncle would be resolved. Such was his designation in 817 of Ali ar-Rida as successor in an attempt to gain Alid support; this plan was frustrated by the death of Ali in 818. Such also was the policy of the Inquisition (*mihna*), adopted in 833 a few months before his death but continued by his successors till about 848. Judges and other officials were required to profess publicly that they believed the Koran the created, not the uncreated, word of God. This was a doctrine held by the theological sect of the Mu'tazilites, a group of whom were close to the government. Though acceptable to the Shi'ites, it provoked opposition in other sections of the community. Linked with the support of the Mu'tazilites was the provision made by al-Ma'mun for translations from Greek of philosophical and scientific works, which greatly influenced the whole subsequent development of Islamic culture. He himself and the court showed great interest in this widening of intellectual horizons. The growing weakness of the central government is shown by several serious revolts after 819, and by the necessity under which al-Ma'mun found himself of continuing Tahir's family in the governorship of Khurasan—a premonition of the disintegration of the caliphate. His last years saw the renewal of war with the Byzantines. Al-Ma'mun died on a campaign in Anatolia in 833 and was buried at Tarsus. See also CALIPHATE.

MAMVU, one of a cluster of closely related Sudanic-speaking peoples of the northeastern provinces of the Democratic Republic of the Congo. They are also known as Momvu and call themselves Tengo. The main tribes of the cluster are the Mamvu (24,000 in the 1960s); Mangutu (often known as Mombutu—to be distinguished from the Mangbetu and Mangbele—and numbering 9,000); Balese (19,000) and Mvuba (a few thousand). There are many related smaller tribes in the area and the larger groups are divided into subtribes each with its own name; the nomenclature of groups in this region is extremely confused. It seems that the Mamvu are the parent group, the others having split off in past migrations. The whole region has been the scene of much migration and interspersal of small tribal groups, caused by the conquests of the Mangbetu and Azande (*qq.v.*) empires to the immediate north. The area also contains many Efe pygmy groups, speaking a language closely related to Mamvu.

These groups are agricultural, the most important crop being the oil palm; the extensive areas of palms were probably one of the chief objectives of the invasions from the north, as this palm does not grow north of Mamvu in this region.

The Mamvu lack any traditional, centralized, political authority, what political authority there is being exercised by the heads of patrilineal totemic clans. Before the Belgian administration (1908) they were largely under the authority of Mangbetu and Mangbele chiefs. The Mamvu are reputed to have been cannibals, but the evidence is not conclusive. See also AFRICA: *Ethnography* (*Anthropology*): *West Central Africa*.

MAN, EVOLUTION OF. From the point of view of the biologist, the problem of the evolutionary origin of man is only one of the many problems of mammalian evolution; for, in his physical structure and physiological functions, man falls within the biologists' definition of a mammal, and thus may be presumed to be the product of an evolutionary process similar to that which is now known from the fossil record to have occurred with other groups of mammals. At the time of the publication of Charles Darwin's *Origin of Species* (1859) there was considerable opposition to the conception of evolution as a whole, mainly because the idea of the fixity and immutability of the different species of animals and plants was very prevalent at that time. In part, this opposition was no doubt due to the influence of the biblical story

of the creation and to the fact that the teleological "argument from design" for the existence of a divine intelligence was superseded by the hypothesis of adaptation through natural selection, but it was also due to the purely scientific evidence adduced by taxonomists that species are clear-cut and sharply defined categories that are not linked by intergradations. As is well known, the cumulative evidence advanced by Darwin, reinforced by his exposition of the process of natural selection (a conception that had also occurred independently to the great naturalist Alfred Russel Wallace), eventually compelled acceptance of the main hypothesis of organic evolution. But general acceptance was certainly delayed by the circumstance that the hypothesis inevitably involved the consideration of man's relationship to lower animals, and the implied conclusion that man is also the product of an evolutionary process (and not a unique and special creation) dominated the minds of antievolutionists for a considerable time. It is possible that some of the more bitter controversies in the early days of evolutionary discussion might have been avoided if a clear distinction had been made between what may be termed "anatomical and physiological man" (*i.e.*, the biological species *Homo sapiens*) and the concept of *Man* in its wider philosophical context, for it is certain that misconceptions have arisen in the past, and even today still arise from time to time, from the use and misuse of the colloquial terms "man" and "human" in the discussion of evolutionary origins.

The difficulties involved in achieving a precise definition of these terms are discussed in HUMAN NATURE—an article that includes also an outline of the *Encyclopædia Britannica's* treatment of the efforts of scientists and philosophers to explore the nature of human nature.

Not even anthropologists always employ the terms "man" and "human" consistently, but the main difficulty is that they are terms that in ordinary usage are commonly taken to imply very much more than the meaning attached to them by anatomists and biologists when they are considering man only in a strictly anatomical or biological sense. It is, in fact, almost impossible to give a satisfactory definition of man that will satisfy all schools of philosophy. The anatomist is not qualified as an anatomist to define man as *Man*; he is competent only within his own special field of study to define man in anatomical terms as one of the species of the animal world—*Homo sapiens*. For this reason, it is a matter of importance that discussions of the evolutionary origin of our own species should as far as possible avoid the terms "man" and "human"—except when there can be no possible misunderstanding as to what is meant by them. Undoubtedly the whole problem can be approached with much greater objectivity if confined rather strictly to the scientific terms of zoology, such as *Homo* (meaning the generic group of which *H. sapiens* is the only surviving species) and the Hominidae (an inclusive term meaning the zoological family of which *Homo* is one of the genera). It has been suggested that, as a matter of convention, the terms "man" and "human" may reasonably be applied (and limited) to those representatives of the family Hominidae who acquired a level of intelligence enabling them to fabricate tools and implements.

As a broad generalization, such a definition is justifiable, for the ability to design and manufacture tools for different purposes, however simple the construction, involves powers of visualization and abstraction far beyond anything found in the rest of the animal world. But it is a definition that is not always applicable to extinct types of hominid, for evidence of toolmaking capacities in such cases may not always be forthcoming.

GENERAL EVIDENCE FOR EVOLUTION

There is no need to enter on a detailed discussion of the evidence for evolution as a whole, for this will be found in another article (*see EVOLUTION, ORGANIC*). But the different lines of evidence are summarized briefly below in order to see how far they are applicable to the special problem of the evolutionary origin of the Hominidae.

Comparative Anatomy of Living Types.—The unity of design shown in the anatomical structure of different animals (even when they appear superficially to be strongly contrasted) suggests

a genetic relationship; *i.e.*, that the common structural pattern has been inherited from a common ancestry, and that the superimposed differences have been developed as the result of a gradual process of evolutionary diversification. On this hypothesis, degrees of relationship are indicated by degrees of resemblance in anatomical structure. Thus, if two types very closely resemble each other in a complex pattern of anatomical details, it is inferred that their genetic relationship is correspondingly close. Considerations such as these provide the basis for modern classificatory systems in zoology, and taxonomists aim at a natural classification of animals which expresses real evolutionary relationships. The fact that it is often possible, in the study of modern types, to arrange animals in a gradational series connecting those of simpler with those of more complex organization, or, in other words, to demonstrate what the older French naturalists called *l'échelle des êtres*, does indeed suggest that they are the products of an evolutionary process. For such a series demonstrates that there are links of an approximate kind in the animal kingdom even as it exists today, and such links may evidently represent the modified survivors of an actual evolutionary sequence in the past (*see ANATOMY, COMPARATIVE*).

Geographical Distribution.—The geographical distribution of different types of living creatures is most easily explained on an evolutionary basis. This argument is particularly convincing in the study of animal and plant communities isolated by geographical or other factors. In an island population, for example, the degree to which local varieties, subspecies or species differ from each other and from those on the adjacent mainland appears to be directly related to the length of geological time during which they have been isolated and thus prevented from interbreeding with parent groups (*see ECOLOGY: Interactions of Populations*).

Vestigial Structures.—Detailed anatomical study of an animal often reveals degenerate and useless relics of some organ or structure which are explicable only on the supposition that they were fully developed and of functional importance in a past ancestry. The remnants of eyes in naturally blind animals, of wings in flightless birds and of the limb skeleton in functionally limbless creatures are examples of such vestiges (*see ANIMALS, PHYLOGENY OR*).

Embryology.—The temporary appearance of certain structures during the development of the individual from a fertilized ovum (ontogeny) is difficult to explain unless it has reference to stages of evolutionary development in the past. For example, in embryos of those mammals in which, in the adult, certain elements of the skeleton or dentition have been lost, transitory traces of these elements may be found during embryonic development (*see EMBRYOLOGY AND DEVELOPMENT, ANIMAL*).

Genetics.—The study of the cytological basis of hereditary variations (mutations) demonstrates that such changes involve the hereditary units (genes), which are located in the chromosomes of the cell nucleus. Such variations may lead either to large and abrupt or small and closely graded changes in the structure of an organism, and, in either case, they provide a theoretically adequate basis for structural modifications which may be stabilized by the cumulative effect of selective processes (*see HEREDITY: Mutation*).

Potentialities of Selection.—The experience of animal breeders and plant cultivators makes it clear that a diversity of new varieties can be produced from common parent stocks by artificial selection, and field studies demonstrate by population surveys that the genetic make-up of a local group may undergo a gradual transformation under natural conditions of isolation and a changing environment; *i.e.*, natural selection, as well as artificial selection, is an effective agent in altering the distribution of gene frequencies in a local population. Further, statistical studies have shown that with a known mutation rate exposed to selective influences of a given intensity, natural selection is in fact adequate for the production of structural changes such as those that have been postulated to have occurred in evolution in a known period of geological time (*see SELECTION*).

Evidence of the Fossil Record (Paleontology).—The fossil record provides in a number of cases direct demonstration of a succession of closely graded intermediate types that form a tem-

poral sequence and thus provide concrete and objective evidence of the gradual transformations that have been postulated on the basis of indirect evidence to have led to the evolution of a whole series of types from a common ancestral stock (see PALEONTOLOGY: *Evolutionary Evidence*).

EVIDENCE THAT MAN IS THE PRODUCT OF AN EVOLUTIONARY PROCESS

These different lines of evidence for evolution, which have been briefly listed above, are applicable to man as well as to other types of mammal, and some of them may now be considered in this particular context.

Comparative Anatomy.—Anatomically speaking, *H. sapiens* belongs to the mammalian order Primates (*q.v.*). This classification carries the implication that, in common with other representatives of the order, he belongs to a natural group whose members, during the course of evolution, have become gradually diversified from a common ancestral stock. The living primates are characterized (and distinguished from other groups of mammals) in that they have avoided structural specializations of an extreme type. Rather, they have preserved a somewhat generalized structure, which confers on them a very considerable degree of functional plasticity. The order can be defined on the basis of the prevailing tendencies which have dominated its evolutionary development, and which include the following: the preservation of a generalized structure in the limbs associated with a free mobility of the digits (especially the thumb and big toe) and the replacement of sharp, compressed claws by flattened nails; the elaboration of the visual powers and a corresponding reduction in the apparatus of smell; and the progressive development of a large and complicated brain. In the Hominidae these same tendencies have manifested themselves and (particularly in the expansion of the brain and the reduction of the jaws) have advanced much further than in other primates; this zoological family also shows a unique specialization in the hind limbs, for the latter have become transformed into lower limbs for supporting the rest of the body in the erect position, while the mobility of the foot and toes (so characteristic of the primates in general) has become secondarily lost. The justification for the inclusion of the Hominidae in the order Primates is not only based on these general considerations, it is still further emphasized by a detailed anatomical comparison with some of the other members of the order.

The primates that exist today comprise a rather remarkable gradational series which serves to link *Homo* anatomically with small mammals of a very primitive type. The most lowly representatives of the living primates are the tree shrews, small squirrel-like creatures, which have a wide distribution in southeast Asia. So primitive are the tree shrews that some authorities are reluctant to include them among the primates. But even these authorities would agree that they are at least very closely related to the ancestral stock from which the primates in general have been derived. In many of their anatomical characters the tree shrews show such a close resemblance to undoubted primates (*e.g.*, some of the lemurs) as to amount in certain details to an identity of structure. The lemurs, again, show in their more advanced anatomical structure a mixture of characters which indicate an intermediate position between tree shrews and monkeys. The curious little tarsier (which inhabits Borneo and the Philippines) is in some respects even more monkeylike. The various types of tailed monkeys represent a still higher grade of organization and, through the small gibbon, are linked with the large, tailless anthropoid apes—the chimpanzee, orangutan and gorilla. As their name implies, these anthropoid apes are very manlike in their anatomical structure. Their brain, although much smaller than a modern human brain, is relatively well developed as compared with lower primates. It also shows the same pattern of convolutions as a human brain (though in a simplified form), and the similarities in many details of its intrinsic structure (including the cerebral cortex) are astonishingly precise (see BRAIN). These anatomical resemblances in the brain have been found to be correlated with physiological similarities. Thus, the sensory and motor mechanisms fulfill functions that so closely reproduce those of the human brain that for ex-

perimental studies anthropoid apes have been found to be far more reliable than any other nonhuman mammal in their application to problems of cerebral function in man. Many features of the skull and skeleton of the large apes approximate very closely those of the Hominidae, particularly if account is taken of certain extinct primitive hominids. Some of the structural similarities in the skeleton of the trunk and limbs are in part related to posture, for the chimpanzee and gorilla are capable, at times, of balancing themselves on their hind limbs in a manner which suggests an approach (though a rather distant one) to the erect posture that is so characteristic of the Hominidae. In their dentition, particularly in the molar teeth, the anthropoid apes also show a close resemblance to the Hominidae. Indeed, it may sometimes be a matter of considerable difficulty to determine whether isolated fossil molar teeth belong to apes or hominids, for the distinctions that exist between the teeth of apes and of man are in general far less obtrusive when fossil types are considered.

Many of the muscles of the human body have the same disposition and attachments as those of the anthropoid apes. For example, in the sole of the human foot the same muscles are found that are used for the mobile functions of the ape foot, even though in man this mobility is not present. The disposition of the thoracic and abdominal viscera in apes corresponds quite closely with that of man, and even in their microscopic details some of the organs of the body show a remarkable resemblance. These examples of anatomical and physiological similarities between the large anthropoid apes and the Hominidae could well be multiplied. Their implications for a real phylogenetic relationship are further supported by reference to similarities in the serum precipitin reaction of the blood, the similarity of some of the blood groups, similarities in parasitic infestation, in susceptibility to certain diseases and so forth (see IMMUNITY AND IMMUNIZATION; BLOOD GROUPS).

As far as anatomical resemblances are concerned, it was stated many years ago by T. H. Huxley that "Whatever system of organs be studied, the comparison of their modifications in the Ape Series leads to one and the same result—that the structural differences which separate Man from the Gorilla and Chimpanzee are not so great as those which separate the Gorilla from the lower Apes" (by "lower Apes" Huxley was referring to the catarrhine monkeys). This proposition was subsequently labelled by E. H. Haeckel the "pithecometra thesis," an unfortunate term since it might have been taken to imply that the degrees of structural differences among man, anthropoid apes and lower primates can be expressed in strictly quantitative terms. While in certain of its dimensions, or in the degree of complexity of some of the cerebral convolutions, the anthropoid ape brain is morphologically closer to the human brain than it is to the brain of catarrhine monkeys, it is not feasible to state in quantitative terms just how much more closely the ape brain as a whole resembles the human brain. Still less is it possible to state in quantitative terms how much more closely in anatomical structure as a whole man resembles the large anthropoid apes than these apes resemble the catarrhine monkeys. Also, since soft structures of the body are not preserved in fossils, it is possible to compare only modern apes with modern man (*i.e.*, *H. sapiens*) in terms of soft tissue. But, with the data of comparative anatomy of living types and those so far available of extinct types (known from fossil remains), it can be affirmed that, by purely morphological criteria, the Hominidae show closer affinities with the anthropoid apes than with any other group of mammals; with increasing accessions to the fossil record the morphological boundary line between the two families is becoming more and more difficult to define.

Notwithstanding the numerous structural resemblances between the Hominidae and the large anthropoid apes, there are quite pronounced differences mainly related to the size of the brain and the adaptations to an erect posture and gait, as well as characteristic features of the dentition. Such differences have from time to time been stressed by those who claim a certain uniqueness for *H. sapiens* as a biological species and claim that he represents a terminal product of a phylogenetic sequence that must have had an extremely long history of evolutionary independence. Indeed, some have gone as far as to claim that most anatomical resem-

blances between man and apes are the result of evolutionary parallelism or convergence, and that the phylogenetic relationship between the two is far more remote than is commonly supposed. But there is little doubt that the significance of the differences has been grossly exaggerated since they are no greater than equivalent differences found in many other groups of mammals known from the fossil record to be by no means very distantly related. Anatomically speaking *H. sapiens* is unique among mammals only in the sense that every mammalian species has some features unique among mammals. It can be fairly stated that the Hominidae are not sharply separated from other primates by any major morphological feature of either a quantitative or qualitative kind, and it is reasonable that this zoological family is the product of an evolutionary process.

Embryology.—The evidence from comparative anatomy for the evolutionary origin of man receives further support from the study of ontogenetic development. As is well known, each person begins as a single fertilized cell, the ovum. This grows to a mass of cells that undergoes gradual differentiation to form tissues, and the tissues gradually become the definitive organs of the body. This process of ontogeny in some sense reflects the evolutionary history of the individual, and also has a very direct bearing on the conception of human evolution as a whole. For it may well be argued that if man as an individual can come into being as the result of the proliferation and differentiation of a single microscopic cell, there can be no objection to the thesis that mankind is the result of progressive evolutionary development initiated in a simple unicellular organism and passing through successive stages leading to organisms of increasing complexity. The suggestion that, in a modified form, ontogeny repeats phylogeny has been termed recapitulation. But it should be emphasized that this does not mean (as is sometimes popularly supposed) that the stages of embryonic development in any way represent the mature forms of successive stages of the evolutionary history of the individual. It means only that, broadly speaking, the human embryo passes through stages that reproduce the embryonic form of certain ancestral types. For example, in the early human embryo a foundation of gill arches is laid down in the neck region, precisely similar to that which finally leads to the establishment of functional gills in fishes. But in the human (as in other mammals) the elements of these gill arches do not become gills but quite different structures such as the skeleton of the larynx, muscles of the face and so forth. This transformation involves a most remarkable rearrangement of skeletal elements, muscles, nerves and blood vessels, and it seems impossible to explain such a profound modification unless it is supposed that the gill arches have been inherited from a remote ancestor of fishlike form. Some of the skeletal elements, for example, become displaced from their original position and rearranged to form the small ossicles of the middle ear (see *EAR, ANATOMY OF*) through which sound vibrations are conducted to the cochlea; it is particularly interesting that structural stages demonstrating this transformation have been followed in the fossil record of mammalian evolution. Examples of similar transformations in ontogenetic development are to be seen in other systems of the human embryo. For example, the muscles of the trunk are at first laid down in a regular segmental arrangement as they are in the adult form of primitive vertebrates, and subsequently become rearranged to form the definitive pattern of musculature characteristic of the human adult. The early human embryo shows a distinct, projecting tail, but this becomes withdrawn into the pelvic cavity to be represented finally by degenerate vertebral elements that form the coccyx. The heart is not laid down *de novo* with the four chambers characteristic of mammals; the partitioning takes place secondarily, so that for a time in the human embryo the heart is constructed on the same plan as that of lower vertebrates (see *HEART, ANATOMY OF*). The formation of the definitive kidney is preceded by the appearance of kidney tissue corresponding to that which becomes functionally mature in lower vertebrates; but in the human embryo this tissue only puts in a transitory appearance and in the course of development disappears. The arteries of the limbs at first are disposed in a pattern similar to that of lower vertebrates, but subsequently become rearranged in a new pattern

which is functionally more suitable for limbs of human structure. This circuitous route through stages characteristic of lower forms of life, involving replacement of many temporary structures by structures of a very different pattern, provides strong additional evidence for the thesis of man's evolutionary origin from lower forms.

Vestiges.—The functionless remnants of vestigial structures normally found in the human body, or relics which appear occasionally in individuals as abnormalities, also are explicable on the assumption that *H. sapiens* has an evolutionary past. In the vestigial remains of a tail represented by the coccyx, even some of the caudal musculature has persisted in a rudimentary or modified form. The external human ear is attached to muscles whose function is very difficult to understand unless it is assumed that they are the relics of muscles that controlled ear movements in some ancestral stage of evolutionary development. The canine tooth in man is often sharply pointed and projects beyond the level of the adjacent teeth, and it is provided with an unusually strong root; this, again, is explicable if it is supposed that in some ancestral stock the canines were used for the special functions that they commonly have in lower mammals, for in modern man these teeth have no special functions to perform. In the human cadaver it is by no means uncommon to find the remains of muscles which are not normally present in the human body; but they may be normally found in lower primates in which they are required for activities such as those associated with arboreal life. An example of this is the dorsi-epitrochlearis muscle, which extends down the inner side of the arm and is normally present in the lower primates. The occasional reappearance in the human body of an anatomical structure which was presumably present in an ancestral form is termed an atavistic variation. Such morphological elements may persist genetically for millions of years after they have ceased to be of functional importance.

Human Genetics.—The analysis of pedigrees has demonstrated that the mechanism of hereditary transmission is the same in man as in other mammals and that the basis of mutational variations is similar in its genetic organization. In other words, these variations seem to arise as the result of alterations in the gene complex of the chromosomes precisely as they do in other animals, and in the same way they provide the raw material for evolutionary modifications under the influence of selection. Some of the characteristic differences among the races of mankind, such as skin pigmentation and hair form, are apparently based on genetic differences which depend on the interaction of a number of genes. It should be emphasized that the study of human genetics is difficult, and genetic analyses of racial traits are still very incomplete.

Geographical Distribution of Human Races and Adaptive Racial Characters.—*H. sapiens* is a polytypic species; that is to say, it comprises a number of different geographical varieties or subspecies which are commonly termed the races of mankind. As is well known, the races have a fairly well-defined geographical distribution—the Caucasoid peoples in the European area, the Mediterranean type extending from southern Europe and northern Africa through southwestern Asia into India, the Australoid peoples in Australasia, the Negroids in central and southern Africa, the Mongoloids in eastern Asia and the Americas, and so forth. This type of distribution is most easily explicable on the basis of an evolutionary diversification following the migration of representatives of a common ancestral stock to different parts of the world. Such migrations would lead to geographical segregation and genetic isolation which, in the course of time, have provided the opportunity for structural modifications in adaptation to different environments. For example, Australian aborigines have distinctive characters which presumably became stabilized during a long term of isolation in Australasia following a migration from southeast Asia, where peoples are still found (e.g., the Vedda of Ceylon) who show similar characters but in a less extreme form. Again, the highly characteristic features of Negroids must have developed during a period of isolation—probably in central Africa. Natural selection seems to have played an important part in the evolutionary development of racial characters since some of these can be shown to be directly related to particular environments.

Thus, the dark pigmentation of some tropical peoples provides a protection against exposure to strong sunlight; the width of the nose is closely related to the prevailing temperature and humidity and almost certainly has an important physiological significance in respiratory functions; and the type of bodily physique (e.g., the contrast between races of long, lanky physique and those of short, stocky build) also can be correlated with environmental differences. Such observations are consistent with the hypothesis that the races of mankind, as the different varieties of animal species generally, are the product of a gradual process of evolutionary diversification. See RACES OF MANKIND.

RELATIONSHIPS OF THE HOMINIDAE

Even the antievolutionary biologists of past days classified man as one of the Mammalia, but they emphasized his apartness by placing him in a separate order, or even a separate subclass, of mammals. This distinction was influenced by the view held generally at that time that man is the product of a special creation and unique in characters other than those of a purely anatomical or physiological kind. While modern man has such unique qualities, the problem of his zoological classification and phylogenetic relationships, as in the case of the Mammalia in general, is primarily morphological and must be approached on a morphological basis. The intensive studies of comparative anatomy after the beginning of the 20th century, together with the evidence of the fossil record that accumulated later, made it clear that the Hominidae (i.e., the zoological family that includes not only *H. sapiens* but also his extinct precursors) are more closely related to the anthropoid ape family (Pongidae) than to any other group of primates. This view was expressed in the now generally accepted scheme of classification that includes both the Hominidae and the Pongidae in a common superfamily, Hominoidea, and thus contrasts them both with the catarrhine monkeys, which comprise the superfamily Cercopithecoidea. Some systematists would go even further by including the two groups in the same zoological family, but so far this view has found but few adherents.

If the taxonomic approximation of the Hominidae and the Pongidae in a common superfamily represents a natural classification, the assumption follows that these two families ultimately have been derived from a common ancestral stock by an evolutionary process of divergent modification. If this is so, it might be ex-

pected that, in tracing back the ancestry of the two groups in the fossil record, the morphological distinctions between the would be found to become less and less obtrusive. This, indeed, is the case, for it is now known from fossil material that the logically earlier representatives of the Hominidae approximate much more closely to a simian level of development than modern man, while the earlier representatives of the anthropoid ape family, in so far as they had not at that time developed all the specializations characteristic of the modern apes, showed a lesser degree of morphological divergence from the Hominidae.

PALEOANTHROPOLOGY

Paleontology, or the study of fossils, provides the really conclusive evidence for the evolution of the Hominidae in the past. However extensive and compelling it may be, the evidence for evolution based on the study of creatures living today can be only indirect. Direct evidence must depend on actual demonstration from the fossil record of a succession of stages representing the transformation of an ancestral into a descendant type. The comparative anatomy of living forms, together with the geographical distribution of local species and varieties that exists today, suggests that evolution might have occurred. Study of the process of natural selection, experimental genetics, population statistics and so forth establishes quite clearly how evolution could have occurred. That evolution did occur can be scientifically established only by the fossilized representative samples of those intermediate types that have been postulated on the basis of indirect evidence. The field of paleontology which is related to the study of the origin of man is termed paleoanthropology. It is concerned not only with fossilized early representatives of the Hominidae and extinct primates from which this family may have been derived but also with the cultural activities of ancient man and the nature of the environment in which he lived. Here, however, attention will be confined almost entirely to the evidence of skeletal remains. Broadly speaking, the main features of the evolutionary succession of the primates are now known from the fossil record, and they conform in a remarkable way with inferences already reached by a consideration of living primates. At the beginning of the geological period called the Tertiary period—about 70,000,000 years ago—the primates were in existence the most primitive of the primates, small tree shrewlike creatures called the Plesiadapidae. So primitive are the

anatomical characters that it might be impossible to determine that they were primates but for the fact that they mark a gradation toward more highly organized creatures which definitely come within the category of primates. Early in the Tertiary period, during the Paleocene and Eocene, more advanced primates appeared which belong to the same zoological groups as the modern lemurs and tarsiers. Somewhat later, in the Oligocene (probably about 45,000,000 years ago), there came into existence primitive monkeys and exceedingly primitive anthropoid apes. In the succeeding Miocene (30,000,000 years ago or so), anthropoid apes of a generalized type appeared in great diversity in different parts of the world, and their remains have been found in considerable quantity in east Africa, Europe and India. Some of these early types, as far as can be ascertained from teeth and jaw and fragmentary limb bones, might possibly have provided the basis for the evolutionary origin

of the Hominidae, but the fossil evidence is still too meagre to permit any positive conclusion. The earliest hominids known by 1950 date from near the beginning of the Pleistocene (about 1,000,000 years ago), and finds under study in the 1960s have been tentatively dated much earlier. For example, in 1964 hominid material from the Olduvai gorge in Tanganyika was estimated to be well over 1,000,000 years old and officially named *H. habilis*. Since these ancient types already were well advanced along the direction of hominid evolution, it seems that still earlier representatives of the Hominidae must have existed in the Pliocene period. Here there is a conspicuous gap in the fossil record which remains to be filled by careful study of recent and future discoveries.

ESTIMATION OF GEOLOGICAL ANTIQUITY

Before the evolutionary history of man in terms of fossil remains is traced in further detail, it is desirable to note the geological changes that marked the Pleistocene epoch. The date of the transition from the Pliocene to the Pleistocene is an arbitrary point in time, and geologists have not found it easy to agree on its definition. Broadly speaking, it was marked by the gradual onset of a cooler climate in many parts of the world, and the general lowering of the temperature finally led to the Great Ice Age during which, in modern temperate zones, icecaps and glaciers, originating on high levels, spread out for considerable distances over lowlands. This process of glaciation was recurrent and extended throughout most of the Pleistocene epoch; it is now generally agreed that there were four main glacial periods, of varying duration and severity, separated by interglacial periods during which the climate became warmer and in some cases (even in Europe) almost subtropical. Evidence of the successive glaciations can be detected in the characteristic geological deposits left by melting ice and also in the fossil remains of arctic or subarctic animals and plants from the glaciated regions. By the determination of the rhythmical succession of glacial and interglacial phases during the Pleistocene, geol-

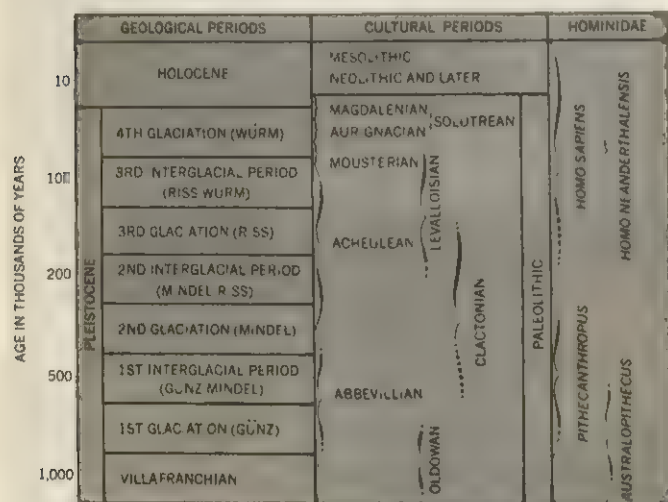

ogically and laid down such stratified deposits as gravel and sand over their alluvial plains. As a result, series of terraces were formed along the river banks, and it is in these terraces that some of the oldest remains of Paleolithic man and his stone implements have been found. The time relationship of the terraces to the glaciations has been worked out in some detail by geologists, and largely on this basis the relative antiquity of the fossils can be established.

In the case of skeletal remains embedded in sedimentary layers formed under the influence of agents such as running water or in stalagmitic formations in caves, the more ancient fossils are found in the deeper layers and vice versa. These deposits in some cases can be assigned to one of the glacial or interglacial periods, and a relative dating thus can be obtained. Another method depends on the fluorine content of fossil bones. The fluorine content increases with geological age by a process of ionic interchange as this element is slowly taken up from the soil and becomes fixed in bony tissue in the form of a very stable compound, fluorapatite. The amount of fluorine in a fossil bone thus increases with time and gives an indication of the period over which it has been in position in a particular deposit. However, this also depends on the amount of fluorine in the soil, and does not permit a comparison of bones from different deposits. But in a case of a hominid skull found with remains of extinct mammals of known antiquity, the fluorine test may be of utmost importance for determining whether they are all contemporaneous or whether the hominid remains may be the result of (say) an artificial interment at a much later time. The fluorine test first aroused suspicions about the authenticity of the Piltdown man (*q.v.*), whose remains were alleged to have been recovered from ancient deposits of an English river terrace. A detailed study of the skull and teeth exposed it as a most ingenious and unscrupulous forgery. Another method depends on the observation that fossil bones and teeth often show some degree of radioactivity by the gradual absorption of uranium from percolating ground water, and the degree of radioactivity of a fossil, therefore, depends partly on its geological age. But it also depends on the permeability of the deposit in which the fossil lies and on the uranium content of the water in past ages. Thus both the fluorine test and the radiometric assay are of value only for determining the relative age of fossils found in the same or strictly equivalent geological formations (see GEOCHRONOLOGY).

The absolute age of a fossil in years can be determined only rarely with present methods. One of these methods depends on the estimation of the relative quantities of radioactive carbon (C^{14}) and ordinary carbon (C^{12}) (see RADIOCARBON DATING). Radiocarbon is assimilated by living organisms from the atmosphere (directly or indirectly) and undergoes a gradual disintegration at a known rate. It is estimated that after approximately 5,600 years the ratio of radiocarbon will have dropped to half the value found in living material. With modern techniques the accuracy of the method is limited to estimations of a period of not more than about 60,000 years. A new potassium-argon method of determining the absolute antiquity of fossil remains has been developed. Ordinary potassium contains 0.01% of a radioactive isotope, which gradually disintegrates to form calcium and argon and which has a half-life of 1.3×10^9 years. A recent application of this method to deposits containing the earliest known fossil hominids in east Africa has provided some evidence that these ancient types may have been in existence as much as 2,000,000 years ago. Lastly, reference should be made to the method of varve analysis, which depends on counting the annual layers of deposits (varves) laid down seasonally by the melting of glaciers as they gradually receded at the end of the Ice Age. But this method is applicable only for the determination of the rate of climatic change in the final stages of the Pleistocene epoch, and the estimations based on it are complicated by the fact that the varves may not always be strictly seasonal in their sequence.

ANTIQUITY OF HOMO SAPIENS

The biological species *H. sapiens* (of which the modern human races comprise a number of different subspecies or geographical varieties) is defined in terms of the anatomical characters shared

FROM "PROCEEDINGS OF THE AMERICAN PHILOSOPHICAL SOCIETY," VOL. 103

CHRONOLOGICAL-GEOLOGICAL TIME PERIODS OF THE PLEISTOCENE

ogists have provided a time scale for inferring the relative antiquity of fossil hominids or of the implements they left behind. If the deposits laid down can be placed in a regular sequence, any fossils found in these deposits likewise can be placed in their proper sequence. Even in those parts of the world (e.g., equatorial regions) where there was no actual glaciation, there was a succession of alternating rainy and dry periods. There is evidence that these pluvial and interpluvial phases can be equated with the glacial and interglacial periods in the northern and southern hemispheres, a matter of importance for determining the time relationships of fossil hominids found in widely separated parts of the world.

The recurrent glaciations were accompanied by considerable falls in sea level, with a profound effect on the formation of river valleys. With the fall in sea level the erosive power of rivers increased and they cut their valleys deeper. With the rise in sea level during the interglacial periods the rivers flowed more slug-

by its members. For historic representatives of the species the definition must be limited to skeletal characters, the only remains to be found. The definition of *H. sapiens* includes such features as a mean cranial capacity of about 1,350 cm.³, an approximately vertical forehead, a rounded occipital skull with a relatively small area for the attachment of the neck musculature, jaws and teeth of reduced size, small canine teeth of spatulate form, the presence of a chin eminence, limb bones adapted to a fully erect posture and gait, and so forth. Any skeletal remains that conform to this pattern to an extent which precludes classification in other groups of higher primates must be assumed to be those of *H. sapiens*. In the past there was a most unfortunate tendency to create entirely new species of *Homo* on the basis of fragments of pre-historic human skeletons even though they showed no significant difference from modern man. This tendency was no doubt prompted by the supposed antiquity of the remains, or by a failure to realize how variable some features are even in modern *H. sapiens*. One of the best examples of this kind of fallacy is the famous Galley Hill skeleton, discovered in 1888 in the Thames valley and supposed to be of very great antiquity. Some anatomists thought they could recognize very primitive features in this specimen, particularly in the shape of the lower jaw. An apparently exhaustive study of the thighbone involving an elaborate statistical comparison of a number of measurements and indices even led to the conclusion that it was quite distinct from modern man. But in later years it was determined, largely as a result of the analysis of its fluorine content, that the skeleton was a burial of comparatively recent date—perhaps the remains of a Neolithic man or possibly even a later interment. How is this discrepancy to be explained? This is rather an important question, for statistical tables are apt to give an impression that conclusions based on them are final and indisputable. But it has come to be realized that the validity of statistical methods in the study of fossils depends on the actual number of measurements taken, on whether the measurements compared are really strictly equivalent in the morphological sense, on whether they are taxonomically relevant and so forth. It also has been demonstrated that if the individual characters of a bone or a tooth are compared independently, one by one, instead of as components of a total pattern (which can be done by the very complicated method of multivariate analysis), entirely different and sometimes very misleading conclusions may be reached. In the case of the Galley Hill thighbone, the statistical study was made with only a very limited sample of modern thighbones assumed to be representative of *H. sapiens* as a whole. Obviously the comparison must be made with adequate samples of all the main varieties of *H. sapiens* before it can be legitimately concluded that there is a distinction.

If the history of mankind is traced back beyond the ages of metal into the Neolithic period, which began about 9,000 years ago, it is found that numerous examples of skeletal remains show no significant differences from modern man. Indeed, much of the Neolithic population in Europe probably was indistinguishable from the modern types of European who inhabit the Mediterranean area. Earlier, from the latter part of the Paleolithic period, the human remains are also those of *H. sapiens*. This is the case, for example, with the Magdalenian period, which lasted during the terminal stages of the last glaciation of the Ice Age and which sometimes is referred to as the Reindeer period, since reindeer were characteristic of the local fauna at that time. The Magdalenian people were very skilful in the production of a great variety of beautifully made flint implements and also instruments of bone, ivory and reindeer antler. They are also noted for their mural art, represented in cave paintings of great artistic merit, which have been found chiefly in southern France and northern Spain. In some of the most famous of these caves, those at Lascaux in the Dordogne region of France, pieces of charcoal were found that are believed to be contemporary with the paintings, and a sample tested by the radiocarbon method gave a date of about 15,000 years ago. The Magdalenian period was preceded in Europe by the Aurignacian period of Paleolithic culture, and a number of skulls and skeletons of the Aurignacian people are also of modern type. Moreover, although in many respects they were culturally inferior to

the succeeding Magdalenian people, they had already developed a fairly complex civilization. The evidence provided by the radiocarbon method indicates that the Aurignacian period dates from about 35,000 years ago, and if men of modern type had already developed an elaborate culture in Europe at this early date, the presumption is that *H. sapiens* must have been in existence as a species considerably earlier.

Several remains of early man from Africa, some unfortunately very fragmentary, with reasonable certainty can be assigned to a cultural stage equivalent to the Upper Paleolithic of Europe. In all cases these remains appear to be indistinguishable from modern varieties of *H. sapiens*. One skull, found at Florisbad in South Africa, is of particular interest, for it was embedded in deposits containing layers of peat, and a sample of the peat closely associated with the skull was used for radiocarbon dating. According to this estimate the peat was probably deposited at least 37,000 years ago, and it has been inferred that the skull is of like antiquity. Upper Paleolithic remains of *H. sapiens* were reported from cave deposits near Peking, associated with a stone culture corresponding to the Aurignacian or Magdalenian in Europe. In the Americas, remains of the species also were described from deposits dated on geological evidence to the terminal part of the last glaciation, and the antiquity of these was estimated at 10,000 years, more or less. One well-preserved skull found at Tepexpan in Mexico was assigned such an antiquity, and this may well prove to be justified, for the radiocarbon dating of organic material from an overlying deposit (which must have been laid down long after the skull was in position) gave an antiquity of certainly more than 4,000 years. There are two other relevant carbon datings that indicate an antiquity for *H. sapiens* in North America of at least 10,000 years; one of these was based on charred bison bones associated with stone implements of the Folsom type (in Texas) and the other on woven rope sandals found in Oregon buried beneath pumice deposited by a prehistoric eruption.

Evidently *H. sapiens* spread over most parts of the world at a very remote time, carrying with him types of Paleolithic culture that provide evidence of their common origin while showing local differentiations. It is unfortunate that the place of their origin is not yet certainly known, for this might give a useful clue to the geographical area of origin of the species. Claims have been put forward on behalf of one area or another, mainly on the basis of fossilized skeletal remains which have been assigned to an antiquity far greater than is known in other regions of the world. But the evidence for this supposed greater antiquity has not in all cases been sufficiently convincing. There is good evidence that precursors of *H. sapiens* were already in Europe before the last glaciation of the Ice Age—during the last (or third) interglacial period—and this could hardly have been less than 50,000 years ago. Examples of such early representatives of the species have been found at a number of different Paleolithic sites (e.g., Fontéchevade, Ehringsdorf, Krapina, Saccopastore). Some of these skulls are very fragmentary, and although some show such primitive features as strongly developed brow ridges, this is not the case in all the specimens. The significance of these features tends to be over-emphasized if comparisons are made only with modern European skulls, but they appear far less obtrusive when compared with the other varieties of modern *H. sapiens* such as the Australian aborigines; they are not sufficiently marked to warrant a taxonomic distinction from this species, though there may be some reason for allocating them to a different subspecies. There are at least two fossil specimens closely related to modern *H. sapiens* that date back to interglacial times—an almost complete skull from Steinheim, Ger., and a very fragmentary skull from Swanscombe, Kent, Eng. These have importance for determining the antiquity of the species. The Steinheim skull was discovered (1933) in interglacial gravels containing remains of extinct mammals such as *Elephas antiquus* and *Dicerorhinus merckii*. There had been some doubt whether these gravels were laid down in the second or third interglacial period, but later studies make it reasonably certain that they belong to the third. The skull has rather a low cranial capacity (1,100 cm.³), which comes well within the range of modern man, however. The brow ridges are strongly developed, but it is doubt-

ful whether they exceed the size of those occasionally found in some modern races of mankind. The anatomical evidence of the skull as a whole, indeed, permits the inference that it may be attributed to a primitive type of *H. sapiens*. The Swanscombe skull consists of only three of the cranial bones, the two parietals and the occipital, all of which are exceptionally well preserved. They were discovered (1935 and 1936) 24 ft. below the surface in well-stratified gravels forming part of the 100-ft. terrace of the river Thames. These are definitely interglacial deposits, and the associated fauna includes *E. antiquus*, *Dicerorhinus megarhinus* and *Megaceros*. Also found with the skull bones were flint implements which can with certainty be assigned to the Middle Acheulean hand-ax industry. The geological, archaeological and faunal evidence is all consistent with the conclusion that the skull bones date to the second interglacial period. Finally, this received confirmation from an analysis of the fluorine content of the bones and of their radioactivity. A most detailed study of the bones (and of the endocranial cast) failed to justify a specific distinction from the corresponding bones of modern human skulls. It was inferred, therefore, that they provide unusually convincing evidence of the existence of the immediate precursors of modern *H. sapiens* in the second interglacial period, to which conservative estimates based on geological considerations give an antiquity of not less than 100,000 years or, according to potassium-argon evidence, probably at least 200,000 years. While this inference regarding the antiquity of the Swanscombe skull bones may be provisionally accepted, it should be regarded as no more than a provisional inference pending the accession of further and more complete material. But, taken with the evidence of the Steinheim skull, it does at least indicate a high probability that *H. sapiens* has an antiquity of this order.

NEANDERTHAL MAN AND NEANDERTHALOIDS

It is known from many fossilized remains discovered in different parts of Europe that there existed during the first phase of the last glaciation a rather peculiar type of the genus *Homo* commonly known as Neanderthal man (*q.v.*), and it is generally accepted that the type is referable to a distinct species, *H. neanderthalensis*. In the early days of paleoanthropological discovery, *H. neanderthalensis* was commonly assumed to represent the ancestral type from which *H. sapiens* derived in late Pleistocene times. This assumption was based partly on morphological arguments; in the flat and retreating forehead, the low height of the cranium, the massive brow ridges, the robust and chinless jaws, the large teeth and so forth, Neanderthal man certainly presents a somewhat simian appearance. The limb bones, also, are characterized by their relative thickness and unusual degree of curvature. But the accumulation of further discoveries made it clear that these apparently primitive features are secondary—the result of a retrogressive evolution from still earlier types which do not appear to be specifically distinguishable from *H. sapiens*. In some of the Neanderthal skulls from deposits which, on stratigraphical evidence, are of earlier date, the typical neanderthaloid features are developed to a less exaggerated degree than in those of a later date. Thus, the specialized Neanderthal type of *Homo* seems to have been preceded by a more generalized type. The brain of the specialized type was, surprisingly, rather large, for the mean cranial capacity actually exceeded that of modern human races. Neanderthal man was contemporaneous with the latter part of the Mousterian period of Paleolithic culture, and his remains have been found at various sites in Europe (*e.g.*, in France, Germany, Italy and the U.S.S.R.) as well as in north Africa and Palestine. Charcoal recovered from an upper level of the Mousterian culture in a cave at Gibraltar indicates a radiocarbon age of 49,000 years. The species evidently disappeared from Europe rather abruptly after the climax of the last glaciation, when it was replaced by an Upper Paleolithic population of completely modern type. It is probable that, with the first recession of the ice following the last glaciation, Europe was invaded (probably from the near east) by the more highly cultured Aurignacian people and that they displaced and exterminated *H. neanderthalensis* (see CRO-MAGNON MAN).

Remains of early man have been found in Java, Rhodesia and

South Africa, which in the general appearance of the skull show a strong resemblance to *H. neanderthalensis*, and are regarded by many authorities as geographical variants of this species. However, they show differences in morphological details, so that their taxonomic relationships are somewhat doubtful. For this reason they are commonly referred to by the rather informal term Neanderthaloid. The remains from Java were found in terrace deposits related to the Solo river and are of Upper Pleistocene date (probably corresponding to the last glaciation). They consist of 11 skulls (all lacking the facial skeleton) and 2 shinbones. In the heavy brow ridges, the thick cranial walls and the flattened skull vault they closely approximate *H. neanderthalensis*. On the other hand, the cranial capacity was smaller, and the shinbones are similar to those of *H. sapiens*. The Rhodesian fossils were found in the course of open-cast mining of lead and zinc ores at Broken Hill in Northern Rhodesia and consist of a skull (almost complete except for the mandible), a maxillary fragment, a sacrum and portions of the pelvis and limb bones. The skull is of unusually massive appearance, with huge brow ridges, a strongly retreating forehead and a large palate. The sacrum, pelvis and limb bones, on the other hand, are not distinguishable from those of *H. sapiens* and show none of the features commonly regarded as characteristic of *H. neanderthalensis*. The artifacts found with these remains indicate an Upper Pleistocene date, estimated on indirect evidence to have been about 25,000 years ago. A second skull of the Rhodesian type (almost identical in its cranial features) was discovered later at Hopefield, S.Af., north of Cape Town, and from the geological evidence it probably somewhat antedates the Rhodesian skull. The significance of Solo man and Rhodesian man in the problem of human evolution is uncertain.

If these types represent variants of Neanderthal man, it must be assumed that the latter wandered widely. It also has been postulated that they represent local developments in the areas where their remains were found, and that they were either aberrant types that became extinct or that they provided the ancestral stock from which modern Australoid and Negroid peoples were derived. However, there is no convincing evidence for this last view, and it would appear that they existed too late in time.

Polygenetic theories of the origin of man hold that the racial varieties of modern *H. sapiens* have evolved independently from different stocks of earlier man. Although the idea may be valid, evidence for it is entirely negative; proponents of such theories do not seem to have taken account of the fact, now well established, that ancient types of *H. sapiens* spread widely over the earth at a very early date.

If it is accepted on the fossil evidence so far available that early varieties of *H. sapiens* certainly extended back to the third and almost certainly to the second interglacial period, the question now arises—is there any evidence that he existed anywhere on the earth at a still earlier date? In spite of reported discoveries for which a greater antiquity has been claimed, the answer to this question in the mid-1960s remained in doubt. If the term man is taken to connote toolmaking hominids, then man has been in existence since at least the early part of the Pleistocene period—that is to say (on the basis of indirect geological evidence and the potassium-argon method) 1,000,000 years ago or more—for his stone implements have been recovered from deposits going back to this remote time. The advanced culture of Aurignacian times was preceded by more primitive cultures termed the Mousterian and Levalloisian, and these again were preceded by populations responsible for the Acheulean hand-ax industry. The latter persisted into the last interglacial period in Europe, but extended back through the whole length of the prolonged second interglacial period, a matter of many thousands of years. Still earlier was the primitive Abbevillian industry, characterized mainly by large hand axes of a rough and unfinished type. Lastly, the very crude pebble-tool industry left its traces in deposits dating from the earliest part of the Pleistocene and found in many different parts of the old world. The only certain evidence of fossil man antedating the second interglacial period bears witness to hominids which, on morphological criteria, were very different from *H.*

sapiens, and they have been referred to as a separate genus altogether, *Pithecanthropus* (q.v.).

PITHECANTHROPUS

The first discovery of *Pithecanthropus*, made at Trinil in central Java in 1891, consisted of a skullcap and thighbone. These were found in alluvial deposits on the bank of the Solo river at a stratigraphic level that (it is now generally agreed) is of Middle Pleistocene age, and they were probably laid down at a time corresponding to the second glaciation of the Ice Age in other parts of the world. The skullcap is astonishingly small and presents a remarkably simian appearance. So much so that some anatomists at first refused to recognize it as hominid at all and supposed it to be from a giant gibbon. By contrast, the femur is entirely similar to that of *H. sapiens*, and some doubt was expressed that it really belonged to the same creature as that of the skull. However, portions of other thighbones of modern type also have been recovered from the same series of deposits, and that they are properly attributable to *Pithecanthropus* has been confirmed by fluorine tests and by the fact that thighbones of similar type also have been found with the remains of the same genus *Pithecanthropus* in China. That the skullcap belongs to a true hominid is shown by the cranial capacity, which exceeds considerably that of any known ape, and by further discoveries in Java. These later discoveries include the remains of three adult skulls and the cranium of an infant, an upper jaw and the adjacent part of the facial skeleton, some fragments of lower jaws and a number of teeth. One of the lower-jaw fragments, distinguished for its great size, has been referred to a new genus of extinct hominid, *Meganthropus*, but there is no convincing evidence that it is other than an unusually large jaw of *Pithecanthropus*. It should also be noted that some of these remains were found in deposits underlying the Trinil horizon, but, according to recent studies, these deposits are also no earlier than the Middle Pleistocene.

From all this fossil evidence it has been established that the Javanese type of *Pithecanthropus* shows very primitive characters in the skull and dentition. The mean cranial capacity was probably rather less than 1,000 cm.³, the forehead region is flat and retreating, the brow ridges project forward as a shelf of bone overhanging the orbits, the cranium is extremely flattened and its general contour is very simian in appearance; the area on the back of the skull for the attachment of the neck musculature shows that the latter must have been powerfully developed, the nasal aperture is very broad, the palate and jaws are massive, there is no chin eminence, the molar teeth are exceptionally large, and in some individuals the upper canine tooth projects beyond the level of the adjacent teeth and interlocks to a slight degree with the lower canine tooth. The infant skull, found at Modjokerto in eastern Java, is of particular interest, for although it belonged to an individual perhaps not more than two or three years old, it shows the incipient development of some of the characteristic features of the adult *Pithecanthropus* skull; e.g., the retreating forehead and the strong brow ridges. The cranial capacity of the skull is about 700 cm.³ and it has been estimated that in the fully grown individual it would not have exceeded 1,000 cm.³. The study of endocranial casts has emphasized the primitive character of this extinct hominid, for in its proportions and dimensions the cerebrum shows an approximation to that of the apes, as also in the convolutional pattern of the frontal lobe of the brain. Apart from the size of the canine tooth in some individuals, the dentition is entirely hominid in its general characters. No stone artifacts have been found in the strata from which remains of *Pithecanthropus* were recovered in Java, but stone chopping tools and primitive hand axes occur in deposits of a slightly later age; it is not improbable that such tools actually were made and used during the Middle Pleistocene by hominids of the *Pithecanthropus* type in that region. The thighbones indicate a height of about 5 ft. 8 in. and, since they are not distinguishable from those of *H. sapiens*, it may be inferred that *Pithecanthropus* already had developed erect posture and gait quite similar to those of modern man. Thus, the Javanese type

has been called by the specific name *P. erectus*. Some authorities have interpreted the large mandibular fragments as evidence for the existence in Java during the Pleistocene of giant hominids. But this is a misapplication of the term giant, which is commonly taken to refer to stature. A large jaw does not necessarily imply a giant individual; on the contrary, as far as the available paleontological evidence goes, there is some reason for assuming a negative correlation between the size of the mandible and the total stature in primitive hominids. Certainly, as has been seen, the thighbones from the Trinil deposits provide no evidence of great height.

The Chinese representatives of *Pithecanthropus* (usually called *P. pekinensis*) are known from skeletal remains discovered at Chou-k'ou-tien, near Peking. The first find (1927) consisted of a lower molar tooth. Two years later, a well-preserved cranium of very primitive type was found at the same site. These remains were at first given a different generic name, *Sinanthropus* (q.v.), but their close relationship to the Javanese *Pithecanthropus* soon became evident, and the term *Sinanthropus* has been discarded by most scholars. *P. pekinensis* is now known from the remains of 14 skulls, as well as portions of the facial skeleton, several mandibles, many teeth and a few limb bones. The cranial capacity has a mean value of more than 1,000 cm.³, but it seems to have been remarkably variable, for in four individuals it shows a range from 850 to 1,300 cm.³. The latter figure comes well within the range of variation of *H. sapiens*. All the skulls show a marked flattening of the cranial vault, heavily constructed brow ridges and thick bony walls. The facial skeleton is strongly built, the jaws and teeth are large, and the mandible lacks a chin eminence. The forehead region is better developed than in *P. erectus*, and, with the somewhat larger cranial capacity, has been taken to indicate that *P. pekinensis* was slightly more advanced. The teeth, in spite of their large size, conform in all essentials to the hominid pattern, and the canines, though in some individuals large and conical, do not project to any marked degree beyond the level of the adjacent teeth. The limb bones found at Chou-k'ou-tien comprise portions of seven thighbones, two upper arm bones, a collarbone and one of the small bones of the wrist. In no character has it been satisfactorily demonstrated that any of these are distinguishable from those of *H. sapiens*.

In the same deposits yielding remains of *P. pekinensis*, crude cores and trimmed flakes of quartz and silicified rocks were found, comprising a local Paleolithic industry of an archaic but fairly uniform character. Some bones of other animals, which evidently had been broken for their marrow content, also were found. Finally, the deposits contained the remains of hearths and quantities of charred bones, evidence that these ancient hominids were skilful hunters and had learned the use of fire for domestic purposes. It seems clear that, in spite of their very primitive morphological characters, the Chinese representatives of *Pithecanthropus* already had developed a very active communal life. The geological evidence makes it fairly certain that they lived during the Middle Pleistocene, probably at a time corresponding to the second interglacial period.

The question arises whether the geographical range of *Pithecanthropus* extended outside the far east. There is some evidence that it did, and reference may be made to the massive, chinless jaw found in 1907 in a sand pit at Mauer, Ger., near Heidelberg. The jaw is very simian in appearance, but the teeth, though large, are typically hominid. This specimen is usually referred to the species *H. heidelbergensis*, but it may equally well belong to the genus *Pithecanthropus* (see HEIDELBERG JAW).

The identification of the specimen is hardly possible in the absence of the skull. The fossil was found in association with *E. antiquus* and other extinct mammals characteristic of the early part of the Pleistocene; it probably dates from the commencement of the first interglacial period, which would give it an antiquity of several hundred thousand years. No stone implements were found at the site. Two lower jaws, quite similar to the Heidelberg fossil and possibly also belonging to a type of fossil hominid not taxonomically distinct from *Pithecanthropus*, were found in Algeria in 1954 in association with stone artifacts of an early hand-ax

industry ascribed to the early Acheulean phase of Paleolithic cultures. Although these jaws with the lower dentition appear to show no marked deviation from *Pithecanthropus*, they have been assigned, with no apparent justification, to yet another new genus, *Atlantropus*. The geological and archaeological evidence suggests that these specimens date from a period of the Pleistocene slightly later than Heidelberg man. An incomplete cranium found at the Olduvai gorge in Tanganyika in deposits also containing stone tools of the Abbevillian culture appears to have a close resemblance to the cranium of *Pithecanthropus*, though in minor respects somewhat more advanced in its morphology. It thus appears that the genus *Pithecanthropus* may have extended its geographical distribution as far south as east Africa.

The paleontological evidence indicates that *Pithecanthropus* lived long before *H. sapiens* came into existence. He was, therefore, a precursor of *H. sapiens*; this naturally suggests that he was actually ancestral to this species. When it is suggested that *Pithecanthropus* may have been ancestral to *H. sapiens* (and the evidence of paleontology and comparative anatomy lends considerable support), it is not meant to be implied that the actual individuals whose remains have been found in the far east and elsewhere were themselves the ancestors, nor even that the local groups or species that they represent were so. It only means that the genus as a whole may have provided the ancestral basis from which modern types of man initially derived. Other representatives of *Pithecanthropus* than those already known, and perhaps a different specific group of the genus, may have provided the actual ancestors. This will be settled only when much more paleontological evidence has accrued.

The most that can be said without more evidence is that *Pithecanthropus*, primitive types of *H. sapiens* such as those known to have existed in pre-Mousterian times, and modern *H. sapiens* provide a gradational series and a temporal sequence; this strongly suggests that they represent an actual evolutionary lineage. Parenthetically, it should be noted that some authorities have doubted whether *Pithecanthropus* can properly be distinguished as a separate genus from *H. sapiens*, and they recognize the type as no more than a separate species, *H. erectus*.

Perhaps the most striking feature of the archaic *Pithecanthropus* is the combination of very primitive and almost simian characters of the skull, jaws and brain with a dentition that is fundamentally of the hominid type (contrasting very strongly with the dentition of all anthropoid apes, whether recent or extinct) and with limb bones which, known from rather fragmentary remains, are no different from those of modern man.

It seems clear, therefore, that in evolutionary development of the Hominidae, adaptation of limbs for erect posture and gait and acquisition of hominid dentition began earlier and proceeded more rapidly than the modification of the skull and jaws or the expansion of the brain to the form and proportions characteristic of *H. sapiens*. There is some reason to suppose that the expansion of the brain to modern proportions must have been a rather rapid process compared with evolutionary rates in general. Certainly there is no evidence that the brain had begun to approach modern dimensions before the Middle Pleistocene, and it is a matter of some importance that this should be recognized. For the consensus among paleoanthropologists was (in the early 1960s) that the Hominidae, as an evolutionary radiation distinct from that of the anthropoid apes, probably became segregated not later than the Miocene or the early Pliocene, several million years before the commencement of the Pleistocene. If this is so, it means that the earlier representatives of the Hominidae must have retained brains of simian proportions for a prolonged time.

During this interval, however, they were presumably already differentiated from the ape family by modifications of the limbs for the erect posture (one of the outstanding diagnostic characters of the Hominidae) and by development of hominid dentition (both of which features were already well established in the Middle Pleistocene by the genus *Pithecanthropus*). From the anatomy of man and modern apes and from the paleontological evidence recounted above, the initial differentiation of the Hominidae and the anthropoid ape family from a common ancestral stock was re-

lated to divergent trends of evolution which, in the limbs and dentition, were rather strongly contrasted; there is some reason to suppose that, more than anything else, it was the divergent modification of the limbs for very different modes of life that determined the initial segregation.

If these inferences are correct, it must be presumed that the *Pithecanthropus* phase of hominid evolution was preceded by a phase characterized by a still smaller brain but in which limb structure and dentition might be expected to show at least some modification in the direction of evolution which has characterized the Hominidae. The interesting question now arises—is there any fossil evidence that such a type ever existed? The answer to this question is to be found in the remarkable discoveries made in South Africa and in east Africa of the remains of creatures to which (as a group) the name Australopithecinae has been given. It is difficult to give them a less pedantic name without misleading implications, though, because of the curious mixture of anatomical features that characterize these creatures, they are sometimes referred to as man apes or near men.

AUSTRALOPITHECINAE

The first fossil evidence of the existence of these creatures was obtained at Taungs in Bechuanaland in 1924—the skull and a natural endocranial cast of an immature individual (see AUSTRALOPITHECINE). This specimen shows a number of features (particularly in the milk dentition) in which it approximates much more closely to the Hominidae than do any of the known anthropoid apes. But, because the distinguishing characters of the skulls of adult apes and of the Hominidae are not so conspicuous in immature individuals, considerable doubt was then expressed regarding the significance of the apparently hominid features of the Taungs skull.

Later, from 1937 onward, considerably more remains of the same type were discovered in the stalagmitic deposits of ancient caves and fissures formed in dolomitic limestone at sites in the Transvaal. As the result of excavations extending over a number of years, a great quantity of important fossil material was collected, consisting of a number of skulls of immature and adult individuals, many upper and lower jaws, numerous examples of the permanent and deciduous dentition, several specimens of the limb skeleton, six examples of the bony pelvis and the greater part of a vertebral column, which was found still articulated

BY COURTESY OF "THE STAR," JOHANNESBURG, SOUTH AFRICA

THE TAUNGS SKULL (A) LEFT SIDE SHOWING RECESSED FACE, HUMANOID TEETH, VERTICAL FOREHEAD AND CAST OF BRAIN PATTERN; (B) RIGHT SIDE (C) SEMIPROFILE SHOWING HUMAN APPEARANCE; (D) FRONT SHOWING SMALL INCISORS AND CANINES, AND NASAL OPENING BEHIND EYE SOCKETS

With this material, more information is available about the anatomy of the Australopithecinae than about that of almost any other extinct group of higher primates. The outstanding characters are: (1) a small cranial capacity equivalent to that of the modern large apes (but in some examples probably exceeding it, at any rate in relation to body size); (2) massive projecting jaws; (3) large molar and premolar (or bicuspid) teeth but remarkably small incisors and canines; and (4) pelvis and limb bones constructed on the hominid plan (but showing significant differences from those of modern *H. sapiens*). The combination of a small brain case with large jaws gives the skull a most apelike appearance, and largely for this reason some authorities at first took the view that the creatures were really apes in the taxonomic sense.

However, a critical analysis of the cranial and dental characters, and especially the evidence of the pelvis and limb skeleton, makes it clear that the total morphological pattern conforms to the pattern diagnostic of hominid evolution and certainly not of anthropoid apes.

This remarkable combination of characters provoked rather acute controversies regarding their precise taxonomic position. Unfortunately, the discussions were at first somewhat confused by exaggerated claims on both sides. Thus, claims that the Australopithecinae were capable of fabricating bone tools and that they had even learned the use of fire were based on evidence that proved to be quite inadequate. On the other side, it was claimed (mainly on the basis of rather scanty earlier discoveries and partly from the application of inadequate statistical methods) that some of the skeletal and dental characters were no different from those of modern apes. The later accession of much more complete material showed that these latter claims had been put forward too hastily. For example, the dental morphology is now completely known, and it conforms in all fundamentals to hominid dentition.

The canine teeth are consistently small, of spatulate (instead of sharply conical) form, and they became worn flat from the tip so that (as in modern man) the biting surface at an early stage of attrition was brought level with the biting surface of all the other teeth. They never overlapped and interlocked in occlusion as they do in anthropoid apes. The front lower premolar tooth is consistently bicuspid as in *Pithecanthropus* and entirely different from the pointed sectorial type of tooth, which is characteristic of apes, recent and extinct. The molar teeth are not easily distinguishable in their cusp pattern from those of *Pithecanthropus* and, though large, in many individuals their size comes within the range of this genus of hominids. Lastly, the teeth are consistently arranged in an even arcade of elliptical or parabolic form, with no gap (or diastema) between the canines and adjacent teeth—a disposition that, once again, is hominid and in marked contrast with ape dentition. Application of careful statistical methods has demonstrated that the taxonomically relevant dimensions of the canine teeth lie far outside the range of variation of modern apes.

The skull presents a number of features which, taken in combination, are never found in apes but which are characteristic of hominids. These include the cranial height, the low position of the occipital protuberance, the detailed conformation of a number of features in the cranial base and the shape of the mandible. In a few of the largest australopithecine skulls, the vertex is marked by a low median crest which is related to the growth of large temporal muscles that moved the massive jaws. In one of the earliest of these skulls that was discovered, the occipital region was missing, and it was argued that the median crest must have extended back into a high transverse nuchal crest on the back of the skull just as it does in gorillas (implying an exceptionally powerful development of the neck musculature).

However, other skulls with a median crest on top and with the occipital region preserved show that there was no high nuchal crest of the gorilloid type—the muscular markings for the neck muscles are low in typical hominid fashion. This has an important bearing on the poise of the head, for the reduction of the neck musculature in the Hominidae is related to the fact that with the development of an erect posture the skull becomes more

evenly balanced at the top of a vertical spine, and a powerful neck musculature no longer is required for holding up the head at the end of a forward-sloping spine. The contour of the back of the australopithecine skull, combined with details of the articular condyles on the cranial base, led to the inference that the Australopithecinae must have been adapted to an erect posture and gait approximating that of *Homo*. This inference received remarkable corroboration from the discovery of portions of thigh-bones and of the pelvic bones. The latter are of particular importance, for the total morphological pattern of the bony pelvis of the Hominidae is perhaps their most characteristic skeletal feature and, indeed, distinguishes them from all other primates (including the anthropoid apes). This pattern, moreover, represents in its major components an adaptation to the mechanical requirements of an upright or erect posture.

These components include the great breadth of the iliac blade, lengthening of the iliac crest for the more extensive attachment of powerful back muscles needed to support the trunk in the vertical position, backward displacement of the area of attachment of certain buttock muscles so they can be effective in upright walking, the rotation and downward shifting of the joint through which the weight of the body is transferred from spinal column to lower limbs, development of a very distinctive bony eminence marking the attachment of a powerful ligament required to stabilize the hip joint in the erect position and so forth. Not one of these features is found in the ape pelvis.

On the other hand, pelvic bones of the Australopithecinae all show every one of them consistently; the pelvis is constructed fundamentally on the hominid plan, and was adapted for erect, bipedal posture and gait. The anatomical evidence of bipedalism is entirely consistent with the geological evidence of the environment in which the creatures lived, for this shows quite positively that they were not forest dwellers but lived in open country very similar to the veld of the Transvaal today—an environment quite unsuitable for anthropoid apes of the modern type.

Until 1959 no indubitable australopithecine remains had been found outside South Africa. In that year an almost complete skull of the same group of primitive hominids was discovered in a stratum of deposits of early Pleistocene date at the Olduvai gorge. It is almost a replica of some of the more massive skulls from the Transvaal and the cranial roof is surmounted by a sagittal crest of the same type. Associated leg bones, the tibia and fibula, are remarkably hominid in appearance. Of more importance, these remains were resting on what was evidently a living site strewn with crude stone artifacts (and the flakes struck from them) of a recognized culture called the Oldowan. This outstanding discovery confirmed the evidence previously obtained in South Africa that the Australopithecinae were capable of fabricating stone tools. This skull was named *Zinjanthropus* but does not seem to be generically distinct from the South African fossils.

The latter also have been multiplied by some authorities into a number of different genera; i.e., *Australopithecus*, *Plesianthropus*, *Paranthropus* and *Telanthropus*. But, in spite of conflicting opinion, there seems to be no valid reason for recognizing more than one genus (*Australopithecus*) and differences that *Zinjanthropus* may show are so minor as to merit a distinction equivalent to no more than a geographical variety, or at the very most a specific distinction. At a level in the Olduvai deposits below the remains of this individual a juvenile mandible has more recently come to light, with dentition also showing the characteristic features of *Australopithecus*. With the mandible were found the parietal bones of the skull and a number of limb bones, including an almost complete skeleton of the foot. This last discovery (*H. habilis*) is of particular importance regarding the extent to which the Australopithecinae had developed erect bipedalism (if *H. habilis* is regarded as truly australopithecine).

The taxonomic status of a previously unknown fossil—whether it is a primitive, small-brained hominid or a member of the anthropoid ape family—must depend on a recognition of the fundamentally different trends that have characterized the evolution of these two families and that are diagnostic of each of them as a

natural taxonomic group. The indirect evidence of comparative anatomy and the direct evidence of paleontology lead to the conclusion that the anthropoid ape family and the Hominidae represent divergent lines of evolution deriving from a common ancestry, and that only toward the terminal stages of the hominid line did the brain expand to the large size of the terminal species, *H. sapiens*.

The anthropoid ape sequence of evolution became adapted for a quite specialized arboreal life with accompanying specializations in the limbs, skull and dentition. The hominid sequence, by contrast, became adapted for terrestrial progression with profound modifications of the pelvic and limb skeleton (and also the skull) for erect bipedalism, and also was characterized by the replacement of sharp, interlocking canines by blunt spatulate teeth, and of pointed sectorial lower front premolars by bicuspid teeth, as well as numerous associated structural changes.

Careful appraisal of the anatomical structure of Australopithecinae makes it clear that, in spite of the primitive characters retained in the size of the brain and jaws, they already had advanced a considerable way in the direction of the hominid sequence and quite opposite to the direction that was followed by the anthropoid apes. For example, in those features in which the pelvic bone has undergone modification away from what must be presumed to have been the type of pelvis in the common ancestral stock, the modification has in every respect followed the direction of hominid evolution. Thus, by definition, the Australopithecinae must be classified zoologically in the family Hominidae. There is no evidence that they had the faculty of speech. But they were capable of fabricating stone tools; if toolmaking (and not merely tool using) is taken as a criterion of man in contradistinction to another animal, the Australopithecinae could be called primitive representatives of mankind.

The question arises whether the Australopithecinae could have been the ancestors of later hominids, including *Pithecanthropus* and *H. sapiens*. There appear to be no sound morphological arguments against such an inference; indeed, the Australopithecinae conform very closely to theoretical postulates for the phase of hominid evolution which, it must be presumed, preceded the *Pithecanthropus* phase. The australopithecine remains discovered in South Africa probably existed too late in time to be regarded as representatives of the ancestral stock; the geological evidence indicates that they probably lived in the Middle Pleistocene, more or less contemporaneously with *Pithecanthropus*. On the other hand, as already noted, the east African representatives of the Australopithecinae date at least from the early Pleistocene, and the potassium-argon method suggests that they have an antiquity of 1,000,000 years or more. In 1964 J. Napier was reported to have estimated the age of *H. habilis* at as much as 1,750,000 years. In 1967 B. Patterson and co-workers announced tentative identification of the manlike Kanapoi Hominid (2,500,000 years old) from study of one piece of elbow bone found (1965) in Kenya more than 300 mi. north of Olduvai, the *H. habilis* site.

In this brief survey a rather remarkable gradational series has been traced, leading from modern *H. sapiens* to primitive types of apparently the same species living many thousands of years ago in the Ice Age, from the latter to the archaic *Pithecanthropus*, which still preserved a number of anatomical characters approximating a simian level of development, and finally to the still more apelike Australopithecinae of east and South Africa. These simian characters do not necessarily indicate a very close relationship to modern anthropoid apes, for they are to be regarded rather as primitive characters derived in the distant past from a common ancestry, retained in the modern apes but subsequently lost in the later stages of hominid evolution.

Although it might appear that the primitive characters of the Australopithecinae emphasize the closeness of man to the apes in their evolutionary relationship, these extinct creatures were already very different from apes in many fundamental hominid characters of the skull, teeth and limbs. From what is known of the rates of evolutionary change in general, it is certain that the line of hominid evolution must have become a separate and independent line at a much more remote time.

ORIGIN OF THE HOMINIDAE

Exactly when the Hominidae, as a separate and independent line of evolution, became segregated from the anthropoid ape family is still not certainly known. No fossil hominid remains have been discovered that antedate *Australopithecus* and *Pithecanthropus*; indeed, in the 1960s it was the most serious gap in the fossil record of the Hominidae. Remains of several types of apes are known from Pliocene and Miocene deposits in Europe, Africa and Asia, but they consist almost entirely of teeth and fragments of jaws. Morphologically, most of these approximate quite closely those of the modern apes, but at least one of the genera, *Ramapithecus*, shows certain hominid traits.

The few remains of skeletons of Miocene apes from east Africa that have been found also indicate that the limbs had not developed the specialized modifications characteristic of modern apes; in many respects they were more like those of cercopithecoid monkeys. A Pliocene ape (*Oreopithecus*) from lignite deposits in Italy has been claimed as a primitive hominid rather than an ape, partly because of the small size of the canine tooth and the bicuspid character of the anterior lower premolar tooth. However, the dentition as a whole displays characters that suggest affinities with cercopithecoid rather than hominoid primates, while the skeleton shows the disproportionate length of the upper limb characteristic of more specialized brachiating apes. Such characters make it difficult to accept the proposition that *Oreopithecus* has an ancestral relationship (direct or indirect) to the Pleistocene hominids. Because of its unusual features, many authorities place this extinct type in a separate family of apes, *Oreopithecidae*.

The primitive characters of many of the Miocene and Pliocene apes are particularly relevant to the problem of the origin of the Hominidae. It has been seriously argued that hominids could hardly have an anthropoid ape ancestry because anthropoid apes are too specialized in limb structure and limb proportions. But there is a fallacy in the assumption that extinct anthropoid apes of earlier times must have shown the same degree of structural specialization as do the end products of the pongid sequence of evolution, which are represented today by the gorilla, chimpanzee and orangutan.

It later became known that this was certainly not always the case. Indeed, on the purely morphological evidence there is no improbability in the thesis that one of the known genera of Pliocene or Miocene apes may represent the common ancestral stock that gave rise, by different and contrasting kinds of adaptive modifications, to the divergent evolutionary sequences of the Pongidae and Hominidae. It has been proposed, and by some even taken for granted, that such features as the sharp, overlapping canines, the moderately sectorial first lower premolars and certain quite minor features of the cusp pattern of the molars constitute specializations which bar these early apes from any consideration as ancestors of the Hominidae. But this is to make assumptions on the irreversibility of evolution which are demonstrably untrue.

In genetic studies it has been shown that single mutations can be reversible in direction, and in phylogenetic studies there are many examples of what may be termed negative reversals; i.e. the retrocession of characters previously well developed. There are strong morphological reasons for inferring that the hominid characters of the canines and premolars have been secondarily derived from those of the pongid type.

It may be noted that paleontologists frequently must consider whether certain extinct types had already attained such a degree of structural specialization that they must be regarded as divergent or aberrant groups with no ancestral relationship to modern types. The answer must depend on the assessment of the total morphological pattern in terms of its probable genetic constitution and the probable complexity of the selective influences that have determined its initial evolutionary development, and also on gauging the degree to which morphological changes have committed the group to a mode of life which has restricted too far the opportunities for selection in other evolutionary directions.

The morphological gap that separates the most primitive of the known hominids (*Australopithecus*) from the known fossil apes

of the Miocene and Pliocene has already been noted. The temporal gap is also large—a matter of at least several million years. From what is known of rates of evolutionary development in other mammals there is certainly no difficulty in postulating a transition from one to the other in this time period. But such a transition, the approximate period in geological time during which it took place and the region where it actually occurred can be demonstrated only by the discovery of the relevant fossil material.

(W. E. L. G. C.)

MAN, ISLE OF (Manx-Gaelic *ELLAN VANNIN* or *MANNIN*), one of the British Isles situated in the Irish sea, roughly equidistant from England, Ireland, Scotland and Wales. It is a lozenge-shaped island about 30 mi. long and 10 mi. wide, its main axis being southwest to northeast. Area 227 sq.mi. The capital is Douglas (*q.v.*). The island is not a part of the United Kingdom, nor is it a "foreign dominion" of the crown; it is a dependency, with a considerable degree of self-government, administered by the home office in a manner comparable with the Channel Islands. It is not exempt from the power of the English court to issue a habeas corpus.

Physical Features.—The island consists of a central mountain mass culminating in Snaefell (2,034 ft.) and extending north and south in low-lying agricultural land. There is fine cliff scenery along both sides of the central massif, whose grass-covered slate peaks are smooth and rounded, the result of ice action during the various glacial periods.

The landscape is treeless except in sheltered places; the many glens are not glacier formed. The island is almost bisected between Peel and Douglas by a narrow lowland tract which is in fact a double river valley, the rivers, all of which are small, running in opposite directions from the centre. The chief rivers

are the Sulby, flowing north and east to enter the sea at Ramsey; the two-branched Dhoo-Glas at Douglas; the Santon at Cas-ny-hauin; the Silverburn at Castletown; and the combined Neb-Rhenass at Peel.

There are no lakes, but the Douglas corporation constructed a large reservoir in the west Baldwin valley. To the southwest is a small islet, the Calf of Man, with precipitous cliffs, similar in structure to the main island, leased by the National trust of Great Britain to the Manx National trust, consisting of one farm and a strictly kept bird sanctuary.

Geology.—The central mass consists of Manx slates, flags, grits and conglomerates in which there is an almost complete absence of recognizable fossils. The slates, provisionally classed as Cambrian, have been much folded and crushed; they overlie the granite mass which has been denuded at Foxdale, the Dhoo and Oatlands (Kirk Santon).

Located in the south is a tract of about eight square miles of Carboniferous limestone which was formerly of great economic importance, providing building material for Rushen castle, the old houses of Castletown, King William's college and the quay walls of all the island ports. The quarries are no longer used for building stone, but there are extensive limekilns. Beneath the limestone is a basalt conglomerate, well exposed on Langness with some interesting "fault arches," and good examples of unconformable strata of conglomerate on the tilted slates. The Carboniferous limestone shows two main series: the lower, Castletown series, and the upper, Poylvaiish, both rich in fossil forms. Flags overlying the upper series were formerly polished and known as Castletown "marble." At Peel an exposure of a dark red sandstone, attributed to the basement beds of the Carboniferous limestone series, provides picturesque building stone which gives the town, its cathedral and castle their rose-red coloration. The northern part of the island is a roughly triangular plain with its apex pointing northeast. This plain is based upon the limestone on which lies a thin band of Permian sandstone covered by a much wider band of Triassic sandstone, all deeply covered by a mass of glacial and alluvial material forming a marshland (curragh) formation of great floral and faunal interest. Toward the apex of the triangle (Point of Ayre) are the Bride hills, a mass of glacial drift, and beyond, along the northwestern coast, is a region of blown sand called the Ayre. The soil in the south is mainly of glacial gravel with local lacustrine and river deposits; from Derbyhaven to Port St. Mary there is blown sand upon which the airport and golf links are situated. To the south of Cregneish are signs of heavy earth movements in the faulting of the slate cliffs, which are rent by chasms and fissures running the whole height of the 200-ft. cliffs. To the southwest of Castletown stands the Stack of Scarlett, possibly a basaltic volcanic side cone, and around it for a considerable area are lava overlays, with basalt sills, and volcanic ash. There is a long history of mining activities—lead, zinc, copper and hematite having been worked—but all the mines are now derelict. They were centred around Laxey and Foxdale, with a few isolated mines in the south.

Climate.—The prevailing winds are from the southwest and the climate is equable. The mean annual temperature is 8.1° C. (46.6° F.), the average mean temperature in February is 4.9° C. (40.9° F.), and in August 14.3° C. (57.8° F.); the average annual mean daily sunshine is 4.31 hours; the average annual rainfall is 41.2 in. Fogs are common, snow and frosts are rare and of short duration. Thunderstorms are rare.

Vegetation and Animal Life.—The number of species of plants on the island is small, and the main interests of the vegetation lie in its varied associations and a comparison of its species with those of the surrounding countries. With the end of the glacial periods the land link was soon destroyed so that comparatively few plants were re-established. There is a profusion of ferns. Sub-tropical shrubs, such as the fuchsia, hydrangea, myrtle, *Escallonia* and *Ceanothus*, flourish out-of-doors, while a prominent feature of the coastal landscape is the abundance of dragon palm (*Dracaena*).

There are no snakes or toads, few frogs and two species of lizards (common and sand). There are no badgers, foxes, moles, voles or squirrels. The mountain hare grows more and more

scarce; rabbits, formerly a pest, were very greatly reduced by myxomatosis. Hedgehogs, accidentally introduced from a wrecked ship at the beginning of the 19th century, are plentiful. The pygmy shrew (*Sorex araneus*) is abundant, as is the long-tailed field mouse (*Mus sylvaticus*); the black and the brown rat and the house mouse are too well-established; the stoat (*Mustela erminea*) is not common. The gray seal (*Phoca vitulina*) breeds on the Calf. There are three bats, the pipistrelle (*Vesperugo pipistrellus*), Natterer's bat (*Murina nattereri*) and the long-eared bat (*Plecotus auritus*). Across the land bridge following the retreating ice came the giant Irish stag (*Cervus giganteus*), of which many skeletons have been found. There is only one species of fresh-water fish, the perch, much localized and probably introduced by the monks. The fish indifferent to salt and fresh water—salmon, brown trout, eel and stickleback—are present. The Manx cat, without a tail or with a greatly reduced tail, is common as a domestic pet in the island but is not indigenous. There is still one small flock of Manx *loghtan* sheep, a handsome four-horned breed. The main faunal interest is in the bird life, as the central position of the island makes it ideal for the study of both sea and land birds and their migrations. Birds not recorded are the jay and the woodpeckers. The chough is much less common than formerly; ravens are plentiful. The buzzard is a rare visitor, and the peregrine falcon is becoming rarer.

Archaeology and History.—All traces of Paleolithic inhabitants were destroyed during the glacial periods. There are many and varied evidences of Mesolithic civilizations, including Tardenoisian and the Bann type of northern Ireland. The Neolithic also has two aspects, one culture being associated with the megalithic monuments (c. 2000–1500 B.C.); the other, the highly individual Ronaldsway culture (named after a domestic site excavated in 1943), is apparently a Manx equivalent of the Late Neolithic of Orkney (Skara Brae). The three chief megalithic monuments are: Cashtal yn Ard, near Kirk Maughold, a gallery grave with a noble forecourt; King Orry's grave, near Laxey, a "double" long cairn cut in two by a road and further mutilated by 19th-century houses; and the Meayl (or Mull) circle, near Cregneish, a unique structure comprising six pairs of chambers disposed on the circumference of a circle.

The Bronze Age is represented mainly by graves containing food vessels, several of Irish type, and the subsequent cinerary urns, and by surface finds of bronze tools and weapons. Groups of circular house foundations at Ronaldsway (excavated 1935–37, later destroyed) may belong to the Late Bronze Age.

The Early Iron Age is marked on the one hand by hilltop forts like some Celtic strongholds in Wales (South Barrule is the largest) and on the other by large, circular, wooden farmhouses, undefended and often sited in lowland meadows (notably Ballakeigan, excavated 1941–44 by G. Bersu), assigned to the 2nd century A.D. After 1956 the many mounds or "forts" on the coastal headlands were investigated by P. S. Gelling and were shown to be Celtic, modified by Norse occupation.

The island became the home of many Irish missionaries in the centuries succeeding the teaching of St. Patrick. This period was marked by the building of oratory chapels, or *keills*, and by grave-stones with incised crosses of varying artistic merit, many of which are to be seen in the parish churches and in the museum. The Scandinavian invasions began about A.D. 800 and the first phase lasted till after the Norman Conquest of England, during which time the vikings came mainly for plunder but slowly began to settle. Already settlements had been made in the Nordreys (Orkney and Shetland) and the Sudreys (the Western Isles of Scotland). Such history of the period as is known is recorded in the sagas of the period. The second viking period began with the arrival of Godred Crovan in 1079 and lasted till 1266. Its history is recorded in the *Chronicon Manniae* (British museum), written by the monks of Rushen abbey (founded 1134). Fourteen kings and 15 bishops are recorded, and Godred Crovan appears to be the King Orry or Gorry of Manx legend. During this period the island was controlled by a Scandinavian system of government which has remained practically unchanged. Godred's son Olaf (1113–52) was the first king to style himself *Rex Manniae et insularum*. His

son Godred II became the vassal of Henry II of England, and from that time the island became a pawn in the game of war between Scotland and England. Reginald I of Man paid homage to the king of England in 1187. Memorials of the Scandinavian age apart from the ancient Tynwald parliament and many place names are to be found in the remains of farm fortresses on the cliff edge, as well as in ship burial mounds at Balladoole (Arbory) and Knock-y-dooney (Andreas). In 1229 Bishop Simon of Argyll was sent from Nidaros (Trondheim) to be bishop of the Sudreys and Man. He began the building of the cathedral on the site of St. German's church on Peel Island by reconstructing the former church as the chancel of the future cathedral. He also built a fortress home, Bishopscourt, at Kirk Michael.

In 1266 the king of Norway sold his suzerainty of Man and the isles to Alexander III of Scotland. This suzerainty had long been repudiated by the kings of Man. Magnus, king of Man at the time, sent an army to assist an invasion of Scotland by the Norwegians. The battle of Largs found Alexander triumphant, and he demanded from Magnus the Sudreys, which were ceded, and from Magnus' son Godred he bought all Godred's claims as king of Man, thus becoming king of Man by purchase. With the rise of Edward I, Man changed hands and became an appanage of England. Edward II lost it to Bruce, who came to the island in person and conquered it, capturing King Orry's tower on the site of the present Rushen castle. But Edward III, by beating Scotland, won back Man, after which time all its kings were English. Edward III gave the kingship to William de Montagu, 1st earl of Salisbury, and from him the title passed to his son, who sold it and his "crown" to Sir William le Scrope. (See MONTAGU.) During the kingship of the Montagus, Rushen castle, a typical castle of the period, was rebuilt round King Orry's tower at Castletown (q.v.). It became the home of the Manx kings and the seat of government. Scrope built a small castle beside the cathedral on St. Patrick's Isle at Peel (q.v.), but he was attainted and executed by Henry IV, who in 1406 granted the island to Sir John Stanley, his heirs and assigns to be called "kings of Mann." The Stanleys refused to be called "kings" but adopted the title of "lord of Mann," which still holds.

With the Stanley regime came a much more stable period of government. The lords rarely visited the island, but they appointed

AUTHENTICATED NEWS

THE "BIG WHEEL" (72½ FT. IN DIAMETER) OF THE OLD LEAD MINE AT LAXEY ON THE EAST COAST OF THE ISLE OF MAN

wise governors and sent strong garrisons from Lancashire. Thirteen members of the Stanley family were lords in succession, with two brief interludes. Queen Elizabeth I in 1594 took over the lordship when Fernando Stanley died leaving only daughters. It was retained by James I till 1607 when he gave it to the earls of Salisbury; but in 1609 it was returned again to the Stanleys. During the Commonwealth, James, the 7th earl, the "Great Stanley," left the island in charge of his countess, Charlotte de la Tremoille, whose military commandant, William Christian (Illiam Dhône), surrendered it to the Roundheads when the earl was executed after the battle of Worcester. Lord Fairfax was made lord of Man, but at the Restoration the young earl Charles resumed the lordship and undid a great amount of his father's good work, chiefly by disputing the permanent tenancies of the farmers, who held their lands under the Scandinavian system of permanent freehold upon payment of the lord's rent and not under the Norman feudal system as in England. As a result of a lasting quarrel with their lord, the farmers neglected the land and turned their attentions to fishing and the contraband trade. The island had no fiscal laws, and spirits, tobacco and silk could be legally imported into the island from which they were re-exported to Great Britain by a fleet of fast clippers with skilful crews. The land question was ultimately put right by the influence of Bishop Thomas Wilson in 1704 in an act of settlement, by which tenants received their lands in perpetuity on payment of a fixed rent, and a fine on succession or alienation. With the death of the 10th earl in 1736, without male heir, the lordship passed through the female line to James Murray, 2nd duke of Atholl, thence to his daughter Charlotte, Baroness Strange, and through her to her husband, John Murray, who also had a claim to the title.

The chief feature of the Atholl rule was the gigantic increase in the contraband trade, which became a serious menace to British revenue, and parliament resolved to suppress it. A Revesting act was passed in 1765 purchasing for the crown the sovereignty of Man for the sum of £70,000 together with an annuity to the duke and duchess of £2,000. The Atholls still retained their manorial rights and the patronage of the see. These were bought by the British parliament from the family in 1828 for the very high sum of £417,144. The 4th duke of Atholl, who built Castle Mona (now a hotel) at Douglas as the official residence of the lieutenant-governors of Man in 1804, remained as governor appointed by the crown. The Revesting act interfered to a considerable extent with the home rule of the island, but constant representations, especially in 1837, 1844 and 1853, produced alleviations, and in 1866 a good measure of home rule was restored to the island.

The People.—The earliest inhabitants in historic times were Celtic in speech, both British (Brythonic) and Gaelic (Goidelic) being spoken in the 6th century A.D. Gaelic (Manx) became dominant and remained the everyday speech of the majority until the first half of the 19th century. However, the number of Manx-speaking people fell from 4,657 in 1901 to 355 by 1951. In 1961 the population of the island was 48,133, that of Douglas 18,821.

The Church.—The first organized church was the Scandinavian Church, which was based on "treen" churches, or *keills*, in which a priest had charge of a tiny church and burial ground, living himself in a small cell usually beside a holy well. Later, 17 parishes were organized, each parish round one of the central *keill* churches, which were enlarged from time to time. But the church buildings maintained the constant type, a nave without transepts, side aisles or chancel, usually whitewashed and with a western bell turret and west door. In general they stood at some distance from the villages. During the Scandinavian period too, were built the cathedral of St. German (now ruined and roofless); Rushen abbey (also in ruins), a branch of the abbey of Furness, which was the controlling factor of the religious life; and Bishops-coart, built as a fortress tower with a moat, and extended later. Of the nunnery near Douglas and the Franciscan friary at Bemaken, Kirk Arbory (founded in 1373 for 12 brethren), nothing remains except the chapels. Since the Reformation the church has retained its ancient organization and has formed a diocese, called Sodor and Man, of the York province of the Church of En-

gland, but it still carries marks of its "national" character in having its own canon law, convocation, and Tynwald control, the appointment of its bishop and archdeacon by the "lord," the retention of its vicar-general, its marriage laws and the appointment of churchwardens. In 1880, by act of Tynwald, four rural deaneries were formed and commissioners appointed to take charge of church endowments. In 1895 a cathedral chapter was authorized, consisting of the bishop (himself to be the dean of his cathedral), the archdeacon, four canons and the vicar-general.

The churchmanship of the island is traditionally evangelical. John Wesley, on his visits, won the affection of the Manx, and as a result the Wesleyan Church is very well established. There are Roman Catholic churches in all the larger towns.

For the language see CELTIC LANGUAGES; see also MANX LITERATURE.

Administration.—The government consists in a lieutenant governor, appointed by the monarch as lord of Man; a council, or upper house; and a house of keys, or lower house. The two houses sit separately as legislative bodies but come together to form a Tynwald court for certain business. The governor presides over the council and Tynwald; the house of keys elects a speaker. The Tynwald court and the house of keys constitute one of the most ancient legislative assemblies in the world. In the Tynwald court the two houses sit and vote separately but transact business and sign bills together. Tynwald controls revenue and appoints boards (education, agriculture and fisheries, local government, etc.). Customs duties are still controlled by parliament, but Tynwald can "impose, abolish or vary" customs duties, subject to parliamentary approval. The approval of the governor and the assent of the sovereign are necessary for every legislative enactment, and until lately such enactments were enforceable only after public proclamation from Tynwald hill in English and Manx. Acts of the Westminster parliament are enforceable in the island only if the island is directly named in them. The lieutenant governor is the supreme legislative authority, chancellor of the exchequer and commandant of military forces and police. An executive committee (constituted in 1946) acts as an advisory council on all matters of government and consists of the chairmen of spending boards and other members of Tynwald up to a total of seven members. The governor presides, and the government secretary, attorney general and clerk of Tynwald are in attendance. There is little trace of party government and no party "whips," and the majority of members are independent. The house of keys is elected for five years but may be dissolved by the governor; there is universal suffrage for men and women above the age of 21. The island is divided into six sheadings (administrative subdivisions), which return a total of 13 members to the house of keys. Douglas returns 7 members, Ramsey 2, and Castletown and Peel 1 each, thus maintaining the traditional 24 keys.

The annual reading of the laws passed during the year is carried out on old midsummer day, July 5, on the Tynwald hill at St. John's in the centre of the island. The day is a holiday and all inhabitants are bidden to attend. The Tynwald court assembles in the church of St. John for a short service after which it proceeds to the "hill," a mound of earth about 200 yd. distant, preceded by the coroners, captains of parishes, clergy and other dignitaries. Only the titles of the acts are now read, first in English, then in Manx.

Education.—Bishop Isaac Barrow in 1667 made education compulsory and founded a system of parish schools run by the clergy—the earliest scheme of compulsory education in the British Isles. In 1872, when the insular legislature passed the Elementary Education act establishing a board of education and local school committees, the state undertook direct responsibility for education. It became free in 1892 and a higher grade school was established in 1894. An act of 1907 established a system of secondary education. Parish boards were abolished in 1920 and one education authority took their place. The Education act of 1949 is based upon the English act of 1944. In the early 1960s there were 30 primary schools (one Church of England, two Roman Catholic). Secondary school reorganization was completed in 1948, there be-

ing separate secondary schools for boys and girls in Douglas and mixed secondary schools in Ramsey and Castletown. There is a small public school for girls (the Buchan school) at Castletown, and a public school for boys, King William's college, founded from the funds of Bishop Barrow's charity in 1832. Among its famous alumni have been Dean Farrar; Field Marshal Sir George White; J. Ellerton, the hymnologist; Sir W. H. Bragg; and T. E. Brown, the Manx poet.

Law.—Until 1920 the governor was president of the high (supreme) court of justice, but after that date he had no judiciary powers. There are now two judges of the high court, called "deemsters," and they have complete jurisdiction covered by the general jail delivery, queen's bench, chancery, admiralty, probate and divorce divisions. There is no regular assize; deemsters' courts are held every week of the legal term in one of the court towns of the island. The senior deemster is also clerk of the rolls; both deemsters can be called upon to act as judges of appeal in cases in which they have not been concerned, and another judge of appeal is appointed from the English bar. Magistrates (justices of the peace) sit in the four court towns, where also the high bailiff (stipendiary magistrate) holds courts; he also acts as coroner in the matter of inquests, etc. The Manx coroner, one in each sheading, holds a less exalted position; he is a court officer, empanels juries, serves summonses, collects fines and acts as a bailiff in cases of unpaid debt. The Manx bar differs from the English in that its members (advocates) act as solicitors and barristers.

There are peculiarities in the laws of real property, but otherwise the laws are practically identical with those in England.

The Shield of Arms.—The arms of the island are "Gules, three legs armed, conjoined in fesse at the upper part of the thighs, flexed in triangle, proper booted and spurred, or." The earliest appearances of the "three legs" of Man are on the village cross of Kirk Maughold, possibly 1375, on the shield of Sir William le Scrope, king of Man, 1395, and on the Manx sword of state c. 1450. The origin is uncertain. The motto *Quocumque jeceris stabit* ("It will stand wherever you throw it") first appears on the coinage of 1668, *jeceris* being misspelled as *gesseris*.

Economy.—The local fishing industry is almost dead, but a Scottish fleet lands herring in the summer at Peel, Port. St. Mary and Douglas, where large quantities are kippered or utilized as oil and fish manure. The Manx kipper is famous and is the most valuable export. There is a profitable scallop fishing (Manx *tanrogan*) off Bradda head. Sizable salmon run up the larger rivers, and there is a government salmon and trout hatchery at Kirk Michael. Liverpool university maintains a biological station at Port Erin which does scientific work in all phases of marine life.

The central massif is not cultivated but is used as grazing ground for sheep. The northern and southern plain lands and the central valley have mixed and dairy farms. Oats constitute the main crop and considerable quantities are exported, as are roots and potatoes. There is a rising export of cattle. Agriculture is well-organized. There are extensive market gardens but not enough to supply the demands during the holiday season. The aim of the island is to be self-supporting in agricultural produce and a great deal is exported.

By far the most important industry is the "holiday" trade; 500,000 persons, on an average, visit the island yearly from all parts of the British Isles. There are flourishing woolen mills producing Manx tweeds, modern flour mills and several well-established light industries.

Finance.—The finance of the island is based on a "common purse" agreement with Great Britain, by which duties imposed in Great Britain are also imposed in the island and amounts of duty paid for dutiable goods purchased in the island are credited to the insular exchequer from London on a basis calculated as the amount of consumption per head in Great Britain. There are no death duties, and income tax is lower than in the rest of Great Britain. In 1961 the Isle of Man government printed and issued its own bank notes for the first time.

Communications.—There is a civil airport (with modern build-

ings) at Ronaldsway, near Castletown, which handles many planes daily from all parts of the British Isles. Packet boats maintain a daily service to and from Liverpool all the year round. The Isle of Man railway (3-ft. gauge, single-track, steam and diesel) links Douglas with Port Erin, and with Peel and Ramsey via St. John's. The Manx Electric railway links Douglas with Ramsey via Laxey (3 ft. [0.9 m.], double-track), and from Laxey to the top of Snaefell has a 3-ft. 6-in. (1-m.) double-track line, with centre braking rail. There are motorbus services from Douglas to all parts of the island.

Since 1904 the Isle of Man has contributed to the development of automotive engineering by passing an act annually in Tynwald closing the roads to ordinary traffic in order to allow the running of Tourist Trophy (T.T.) races over a 37-mi. course from Douglas to Ramsey and back over the mountain road. These races test the engines and mechanisms under severe conditions. The car race began in 1904, the motorcycle in 1907. The motorcycle T.T. race, held in June, has been continuous except for the war years (see **MOTORCYCLING**) but the car race no longer takes place.

MANA is a term of Oceanic origin which, like *tabu* (*q.v.*) has attained a wider usage, though in this case not beyond scientific circles in the 1960s. Basically, the word refers to the idea of power beyond the ordinary—not just physical strength but power of a less tangible kind, though it must be demonstrated by physical results. It is believed that both persons and things can have this power. A chief whose prayers to avert drought from the crops are followed by rain, or a weapon which gives its wielder consistent victory over apparently stronger opponents, are both said to have mana—often translated as success, reputation.

Historically, the term was known from Polynesia in the first half of the 19th century, but it was R. H. Codrington who first provided Melanesian data which stimulated anthropologists and other students of comparative religion. Codrington wrote of "the belief in a supernatural power or influence" which "works to effect everything beyond the ordinary powers of men, outside the common processes of nature," which "is present in the atmosphere of life," and which "though itself impersonal, is always connected with some person who directs it . . ." The very general nature of such expressions promoted much theoretical speculation without leading to empirical research. It was argued variously that mana was an all-pervasive fluid power set in motion by ritual; that it was a mysterious, impersonal entity; that it was not so much entity as quality or attribute. R. R. Marett in England, and H. Hubert and Marcel Mauss in France argued that mana was the basis of magical belief and practice; Émile Durkheim identified it with the totemic principle. Comparatively, mana was linked with such American Indian concepts as *orenda* and *wakan*. In line with their interest in the origins and development of social institutions, many writers saw in mana a concept of force or power of a very primitive kind, anterior to ideas of what might be called personalized spiritual beings and even to religion itself.

Later interpretations have seen in mana and allied notions not a single evolutionary stage or prior component in religious thought but a set of complex, vaguely defined metaphysical concepts expressing the view that human efficacy is not explicable in physical terms alone. A social component is also seen in that a description in terms of mana often appears to be a symbolic way of expressing the special qualities attributed to persons of status and authority in a society, and of providing sanction for their actions. See also **ANIMISM**; **MAGIC**; **PRIMITIVE**.

MANABÍ, a province in the coastal lowland and hilly belt of Ecuador, bounded west by the Pacific ocean, north by Esmeraldas, east by Pichincha and Guayas and south by Guayas. Area 7,306 sq.mi.; pop. (1962) 614,803. Its capital is Portoviejo, pop. (1962) 38,600. The province is occupied chiefly by lowland Indians, who have successfully withstood the advance of the Negroes from the north. The chief products are cotton, coffee, sugar cane, rice, beef cattle and goats. From the fibre of the *toquilla* palm, a plant that grows wild in the semiarid scrub woodland, the Indian women weave Panama hats. The forests also yield balsa wood, tagua nuts and fine cabinet woods.

Connections are by sea through Manta and Bahía de Caráquez or in dry weather by road from Quevedo. (P. E. J.)

MANAGEMENT SCIENCES is a phrase intended to represent a common and mutually accepted concern on the part of a number of scientific disciplines with the study and solution of the problems of management. World War II and the period after saw a great increase of interest on the part of the applied scientist in the management problems of the military and of industrial firms. Recognition of this common interest led to the formation of new societies in the United Kingdom, the United States, and throughout Europe, Asia and Australia, such as the Operational Research society (U.K.), the Operations Research Society of America, The Institute of Management Sciences and Société Française de Recherche Opérationnelle. The phrase "operations research," which appears in some of these titles, was originally used by the military agencies in the U.K. and the U.S. to designate teams of scientists who studied military operations, but has since come to designate the application of science to any operations initiated and controlled by managers. Hence the phrases management science and operations research are often used interchangeably, although the latter sometimes refers to applied research conducted under contract. Similarly, because of a common interest in the process of decision making, decision theory and organization theory frequently have the same connotation as the management sciences. The scientists, in the typical fashion of such cases where the object under investigation is not easily susceptible to recognized methods of science, are groping for names that will adequately portray their interests.

Definition.—The management sciences are bound together by more than a common intellectual interest; they also share a common philosophy of method: namely, the need for more rigorous analysis of the complicated problems of management. This need can often be satisfied by the use of mathematics or of carefully controlled observation and experiment. Opinions about the importance of mathematics vary among those who recognize themselves to be management scientists, but most if not all would admit that science connotes among other things the attempt to become as precise as possible and that mathematics is one of the chief resources of the mind in this endeavour. Differences of opinion usually reflect different judgments about the possibility of reaching refinement of language in specific projects, and the relative importance of research problems. Sometimes the management scientists try to characterize their aims in terms of quantification of managerial activities, because they feel that this term connotes the refinement and rigour they aspire to, and not because they feel any importance attaches to numbers as such.

In order better to understand the goals that hold this community of scientists together and induce them to form associations, one has to examine the concept of management with some care. Any such scrutiny reveals the confusion that attaches to the word in the English language. Often management has a very special connotation; for example, the class of rulers in a society as opposed, say, to labour. Often the phrase is used in a very general way to connote rational behaviour, as when we say that a man manages his affairs very well. Neither connotation represents what the management scientist has in mind. For him, examples of managers are to be found among those who act as

administrators or executives in firms, unions, city, state or federal governments, military agencies, churches and educational institutions.

Thus it is not too difficult to point to specific examples of managers. But it is clear that persons who are called managers do not always manage, and it is almost as obvious that many persons who are not called managers are really a part of the management process. Hence, there is a need to define management as a certain kind of activity, rather than a certain kind of person. Most management scientists would agree that this activity must take place within human organizations. Even this minimal agreement is at variance with some common usage; it precludes talking about the management of a beehive, for example, or the management of one man's affairs. But when scientists band together under a common name, this kind of opposition to common meanings is quite usual.

Next, the community of management scientists would also recognize that the activity or management in organizations includes at least the following: (a) discovering, developing, defining and evaluating the goals of the organization and the alternative policies that will lead toward the goals, (b) getting the organization to adopt the policies, (c) scrutinizing the effectiveness of the policies that are adopted, (d) initiating steps to change policies when they are judged to be less effective than they ought to be. Activity (a) is often called planning and is essentially a cognitive activity carried on by individuals or by committees, who use information collected for them by their staffs. It has become convenient to characterize planning as short range and long range. Long-range planning emphasizes the fact that management may be obliged to consider the survival and growth of the organization over many years, and hence may have to consider many social and intangible goals not usually relevant in short-range plans. Activity (b), the adoption of plans, is an extremely difficult one in large organizations. A paper-and-pencil plan, no matter how attractive to the manager, often cannot be put into action by a simple order. Elaborate communication systems may have to be designed to get a large body of persons moving in the planned direction, and the many subtleties of persuasion and motivation are involved as well. Activity (c), the continuing scrutiny of the effectiveness of adopted plans, is often called control, and is a function that in some instances is the responsibility of accounting staffs. Activity (d), the process of changing plans once they are deemed ineffective, requires not only a designed data processing system, but it also entails the search for the mean between the extremes of changing too often and not changing often enough.

If management is characterized in this manner, it is a term which is applicable to any organized, goal-seeking group of persons. Hence the phenomenon of management may occur in national governments, civic governments, labour unions, schools, universities, business firms and even in scientific research establishments. One should recognize that management does not connote rigid control; an organization may be managed best by permitting maximum freedom of decision among its members.

Further, it should be noted that management as defined above will often include the activities of staff as well as line personnel in an organization, and may in many cases include some aspect of the activities of every member of the organization. Indeed, as in the case of any teleologically defined activity, it is usually not possible to separate management behaviour from nonmanagement behaviour or managers from nonmanagers. A foreman of a shop may in the same act be serving the function of management and the function of production. On the other hand, it often happens that the owners of a firm, members of a union or the citizens of a country do not manage the organizations that supposedly serve their interests. The management of these organizations seeks to determine the goals of the interested parties and tries to make these goals a part or whole of the evaluation basis of their plans, but the interested parties themselves may contribute very little to the management of the enterprise.

The definition of management does not imply that all forms of management are good, but the community of management scien-

tists does have a strong interest in establishing criteria of good and bad management. In this sense, the management sciences are not primarily descriptive, although detailed descriptions of management processes may be quite important. Instead, they are predictive. But interest lies not only in predicting what a given management will do in a certain circumstance, but more fundamentally in predicting what would occur if certain activities were adopted. The outcomes of these predictions are then evaluated, and an attempt is made to rank management activities in terms of better and worse, and if possible to discern the best. Evidently, this evaluation is based on a decision as to whose interests are to be served by management or, more precisely, how various competing interests are to be weighted.

The community of management scientists is largely made up of persons from various disciplines; very few claim this field as their sole area of *expertise*. Interest in and conceptualization of management problems depends on the background of the scientist, so that the management sciences inevitably display radically different emphases. In true academic style, the more vocal management scientists are apt to argue that their own approach and emphasis is fundamental, thus giving rise to the healthy disputes that constitute intellectual growth.

One description of the composition of the community of management scientists follows a traditional classification of the sciences that leads from logic and mathematics through the physical and engineering sciences to biology, psychology and the social sciences, culminating in ethics. But it may be noted that this classification is at best arbitrary, reflecting as it does but one structure of the sciences. Indeed, the adequacy of a classification of the sciences is itself a problem of the management of science, so that members of the community might well be expected to differ on this score as well.

Logic.—Logicians find in the study of management a fertile field for axiomatic theory. The post-World War II trend in the management sciences emphasized both mathematical models and the development of precise measurements. In either case, there was a clear need for a rigorous formulation of the underlying language. This need was especially true in the case of measurement, a term with many historical meanings. The tradition in the management of firms has been that some aspects of the activity are measurable (e.g., a cash balance) and some, called intangibles, are not (e.g., good will). On the other hand, pure scientists observing the vagueness of discourse that surrounds business research often have been inclined to say that in this area nothing is ever really measured. The logicians' task has been to state in as unambiguous a manner as possible what measurement is, what kinds of measurement there are and what can be said in terms of each kind. Of particular importance to the management sciences has been the axiomatic treatment of utility and subjective probability. In the case of utility, an attempt has been made to state in unambiguous terms a theory of preferential choice in decision-making situations. Formal studies of subjective probability try to define precisely a decision maker's beliefs in the likelihood that a certain outcome will follow upon a choice; these studies are based on the observation that even the most carefully educated man does not behave in accordance with the principles of objective probabilities. For example, it has been found that in relatively simple gambling situations involving the toss of a coin, persons typically believe heads (or tails) will be more likely to occur. No doubt this bias in favour of certain kinds of events is also displayed in the attitudes of many managers as well. The scientific task is to measure the attitude in order to better understand the subtle ways in which subjective probabilities influence decisions.

Mathematics.—Interest in the mathematics of management increased tremendously after World War II, although a number of notable treatises had appeared before. This interest resulted in new fields of mathematical research, fields whose titles reflect the potential application to management problems: inventory theory, waiting line (queuing) theory, linear and nonlinear programming, dynamic programming, game theory. Many of the traditional fields of mathematics have been the bases of these developments,

but maximization theory and probability theory are extremely important in this connection, because almost all criteria of evaluation are expressed in terms of maximizing some variable, and because almost all management decisions are based on probabilistic forecasts. The nature and diversity of the mathematics of management can be suggested by brief characterizations of some of the more important examples.

Inventory Theory.—This provides a language for describing the state of a system that is subject to a pattern of demand and has available resources for building up supplies. The demands may be probabilistic and may vary in kind. The replenishment may be subject to delays and uncertainties. The reservoir may be depleted by obsolescence and deterioration. Management costs include cost of shortages, cost of replenishment, cost of holding the supplies. Many studies have been made of inventory problems; it has been found possible to predict the demands on inventory within statistical limits and to estimate the net costs of adopting various inventory policies, even when there are many kinds of inventory, seasonal fluctuations and unpredictable demands. Mathematical language is not restricted to the original intent of its designer. Thus inventory theory may be applied to many problems where the term inventory would not normally be used such as planning of personnel assignments, parking facilities and cash flows.

Waiting Line Theory (Queuing Theory).—The language of a system of service units, this describes how customers arrive for service, how service meets their requirements in terms of average service time and variation in service time, how long the customer may have to wait, how long the service unit may be idle.

Linear Programming.—A language of activities which describes how these activities utilize their resources in order to accomplish certain prescribed tasks; linear programming also describes how these activities operate within the limitations of time and space. The term linear reflects the fact that the basic descriptions must take the form of linear algebraic equations (or inequations). Nonlinear programming permits a relaxation of this requirement. The language of linear programming is astonishingly versatile. In addition to its obvious use in the planning of production schedules, it has been employed in such areas as military logistics, transportation and traffic, personnel assignments and salary levels.

Dynamic Programming.—This maximization theory, among other uses, permits one to maximize over a whole series of states where each state depends on decisions that have been made in earlier states. This language allows one to state in rigorous terms the period-by-period consequences of decisions and to calculate the desirability of incurring temporary losses, say, for the sake of long-run gains.

Game Theory.—A language for describing competitive strategies when the opponents can influence the probability of success of the other "players" under prescribed rules, and can form coalitions to thwart the activities of others. This language therefore is well adapted to the study of competition, but its application has not been extensive because in many realistic problems it is difficult to ascertain what the players really want and the rules that govern their plays. (See GAMES, THEORY OF.)

In addition to these languages, the following can also be mentioned: theories of search, replacement, communication, information and decision making.

All these languages enable the scientist to state in rigorous terms the nature of the problem as he sees it, and the consequences of alternative decisions even when the situation is extremely complicated. Many management problems continue to defy the best efforts of mathematicians to describe them, so that the management sciences devote a great deal of effort in searching for even richer languages than those developed thus far. The complexity and subtlety of many management problems have quite naturally led the unwary to force the problem to fit an existing mathematical model, a procedure that is certainly not unique to this field of science.

Mathematical Statistics.—From the 1920s and 1930s, this discipline has attempted to formulate its foundations in terms of the utilization of information for decision making under uncertainty.

tainty; it therefore shares a common concern with the management sciences, despite differences in terminology. In a sense, the manager of an organization is a statistician, since he gathers data and attempts to test hypotheses, while taking cognizance of the risks and losses associated with wrong decisions. Mathematical statisticians have tried to give a precise formulation of this process, and to determine optimal solutions in cases where the data can be assumed to come from some random source. Of course, in most management problems it is difficult to ascertain the random characteristics of the data, and it is not generally possible to set up experimental designs to test for randomness. But there can be little doubt about the usefulness of a number of statistical models in management studies, and especially models of control and stability.

The physical sciences would normally be expected to have only an indirect interest in management problems, although in the post-war period a number of physicists and chemists applied their research abilities in this area.

Engineering Sciences.—On the other hand, engineering shares many problems with management sciences. For example, the engineer is often concerned with systems in which human beings are links. These systems are goal directed and must include devices that enable one to adjust the activity when it deviates from the goals significantly. It is clear, therefore, that the manipulation and control of an engineered system (e.g., a chemical plant or a guided missile) has many characteristics in common with the management of a human organization. The chief difference seems to be one of degree: the importance of motivation, status, persuasion may be less in the engineered system. But some engineers have quite naturally wanted to apply their knowledge to the area of management. This interest goes back at least as far as the "scientific management" movement, which, in its earlier development, seems to have been chiefly concerned with the control of procedures, especially those of the shop. This movement showed little inclination to develop mathematical models of these procedures, but rather tried to use careful observation and physical measurement to discern how improvements could be made. In this regard, the scientific management movement differs radically in its philosophy from the management science movement. Perhaps this difference can be clarified by saying that scientific management was not interested in trying to develop a model that would reveal all alternatives and provide a criterion for the selections of the optimal choice. Those who, like some "systems-and-procedures" or "time-and-motion" engineers, followed the scientific management movement have been somewhat apart from the community of management sciences, a segregation that may very well be a phase in the maturation of each group.

However, systems engineers who design electronic systems must construct models of the system and it is natural to associate themselves with the management sciences movement. Many industrial engineers have also approached the problems of the scientific management movement from a mathematical point of view.

One output of the systems engineer has been of great importance to all the management sciences: the development of high-speed computers. Evidently the problems of management may involve many variables, and the solutions thus require quite elaborate computations. Such has been especially the case with linear programming models, where several algorithms have been developed which can most economically be solved by computers. Furthermore, the management sciences have found the simulation of a system to be enormously helpful in understanding its complexities, and computers frequently provide the means for simulating. Finally, in the early 1960s there was considerable interest in "business games" and "military games." These games partially simulate an organization in a specially constructed competitive environment. The computer enables the researcher to structure the environment in rather complicated ways, and yet to derive the consequences of the managerial decisions of the teams in a short time. These simulations differ from simulations of a model in that they include human inputs which the experimenter does not control, whereas in model simulation every input is a decision of the experimenter. The games provide the management scientist

with an opportunity of performing controlled experiments with more and more complicated structures.

Biology.—One might expect some coalition of biologists and management scientists, because (1) the analysis of the concepts of organism and organization clearly share a common ground and (2) the central nervous system seems to display a managerial activity. In the early 1960s, however, there were only a few instances of this mutual sharing of intellectual ideas.

Psychology.—Psychologists have studied management from several points of view. Some have concentrated on intense experimental studies of decision making, where the choices are relatively simple and the relevant variables can be controlled. These studies are intended to investigate the utilities of the decision maker and to relate these utilities to other personality variables or to his material or social environment. Some experimental studies have observed the effect of communication patterns, psychological variables and the social environment on the performance of groups who have been given specified tasks to perform. According to one viewpoint, these small group studies are a logical prelude to controlled observation of larger organizations.

Learning and problem solving are psychological concepts that are extremely important for management and hence for the management scientist. It would be unrealistic to picture the manager as a person who knows all the alternatives and merely tries to select the best from the available. Instead, the manager searches for new alternatives and for new goals. He is presumably engaged in a gigantic learning process by which he hopes to make his activities better. Thus the management scientist may try to understand not only what is optimal, but also how one may move most adequately in an optimal direction. Many management problems entail a fantastic number of discrete alternatives. In some of these situations the important problem may be the learning process and not the direct selection of the optimal choice. Hence management scientists share with some psychologists an interest in developing more rigorous models of learning.

Many psychologists have been willing to sacrifice precision in order to gain a broader view of management: e.g., to study conscious and unconscious motivations, status or the "actual" way in which decisions are made. It must be admitted that the management scientists have not been in agreement about the importance of these studies, primarily because although their general value may be apparent, the manner in which they fit into more rigorous models of management is not clear. Similar remarks apply to social psychology and sociology. No doubt here too both the management sciences and the social sciences are in a period of transition; the one may tend to relinquish its rigid and often naïve insistence on precision, while the other will come to recognize the great research power provided by the mathematical languages.

Economics.—During the 20th century, economists have shown a divided opinion on the importance of rigour in economic studies. Some have felt that emphasis on rigour may sacrifice significance. But the econometrician and mathematical economist are clearly allied with the management scientist. Indeed, many such economists view the work of the management sciences in business firms as a logical development of micro-economics. It is true that much of the mathematics of management has come from economics; queuing, search and replacement theory being important exceptions. Although systems engineering and human motivation other than that expressible by utility functions have not been the concern of the traditional economists, some economists think that both these areas are of dubious importance at best to the development of the management sciences. In any case, in the years following World War II, the mathematical economist came to play a central role in the management sciences. Some economists have called themselves managerial economists, to emphasize the fact that the studies of management problems belong in a subclass of economic studies.

Business Administration.—Tending to regard itself as a profession prior to World War II, business administration's chief method of research and instruction depended on detailed descriptions of cases. As would be expected, the management scientist

does not look upon the case method as a scientific method, partly because the language of the case studies is not precise, but mainly because there appears to be no basis for relating the case to the population of which it is presumably a sample. After World War II, a number of business administration specialists joined the management sciences. In some instances, these researchers found it possible to develop mathematical models of marketing behaviour or financial policy making or production planning that satisfied the criteria of the scientific community and were at the same time useful to managers. In other instances (especially in accounting), the management sciences have presented new problems to an old profession. Although managerial accountants sometimes speak as though certain types of accounting data could be used for planning, a careful scrutiny often reveals that the data must be presented in an entirely different way, and that additional data have to be obtained, before an optimal decision can be made. Many accountants point out that accounting has other functions to perform besides that of aiding the manager in his decisions. But it is natural to expect that the growth of the management sciences will attract the interest of research minded accountants. The term administration has raised semantic problems for the management scientist. Many would prefer to use it instead of management because it is less apt to reflect the unintended connotations of rigid control or of management *v.* labour. Others feel that administration should be restricted to the execution of plans and not to their origination.

Organization Theory.—This sometimes refers to a set of principles that are intended to predict how effectively a social group will behave when given an organized structure of lines of authority, responsibility, control, etc. In the 1960s, many students of organization theory tried to develop rigorous models and to incorporate the findings of the behavioral sciences. Thus the intellectual objectives of the management sciences and organization theory are quite similar, especially because organization theorists emphasize the role of management in organization designs.

Other Disciplines.—Law, political science, anthropology, city planning, education and history have a research interest in the study of management, but few of their representatives believe strongly in the feasibility of developing rigorous models of and applying precise measurements to the phenomena they study. This condition seems to be true of ethics and epistemology as well. One would expect that a community of scientists whose chief interest lies in the study of optimal plans and procedures would inevitably find itself deeply concerned with ultimate values. But management scientists tend not to translate this concern into research activity, but rather to accept the value of an enterprise as "givens," no doubt because they are skeptical of the possibility of precise methodology in the area of ethics. Similarly, epistemology could be interpreted rather easily as the study of the management of groups whose aim is to acquire knowledge; *i.e.*, epistemology could be understood as the theory of the management of science, though the use of such terminology might be undesirable in view of the connotations of rigid control that are often associated with the concept of management. But if one keeps in mind the much more general characterization given above, then a plausible case can be made for the position that pragmatism is the philosophy of management (or more generally perhaps, of decision theory). But most pragmatists have not shown a strong interest in the management sciences.

As would be expected, it is not at all clear when a study should be regarded as belonging within the purview of management science. Perhaps the only operational criterion is whether or not the study would have been accepted in any of the existing journals that clearly publish in this field. But such a criterion would ignore the rather rapid changes that are taking place in the management sciences, changes which will bring about a recognition that many studies of the so-called less exact disciplines are really instances of management science.

Importance.—From this account of the sciences one can readily understand that the phenomenon of management is pervasive both in the engineering and the social sciences. Furthermore, few can deny the importance of management for the human race, espe-

cially in an age when almost all major social problems are studied and resolved within an administrative framework. But until the post-World War II period there was no strongly discernible trend to bring this common interest under one discipline. Thus management is sometimes viewed as the control of a system or as a set of interacting psychological forces or as an economically directed activity or as an activity directed toward the public welfare or as an ethical activity. Each discipline has looked at the phenomena through its own spectacles. The management scientists have tried to bring about a coalition which may eventually lead to an established discipline. They have often done this under the banner of a methodological adherence to the value of rigour and therefore at some risk to their entire efforts, for those who prefer not to march under this banner are bound to declare that one's choice in this area is to be precisely insignificant or vaguely significant. And those who prefer the foundations of their own disciplines are bound to find any proposed coalition both dangerous and needless, no matter how much they sympathize with the attempt to become precise. Like all movements, this one will have to develop with due regard to its dilemmas.

Nothing has been said so far about those who are called managers. The management sciences are unique in this respect: the subjects whom they investigate (1) are very vocal and critical, (2) maintain persistent pressure on the scientists to produce something "useful" and "intelligible" and (3) often support the research. These facts sometimes make it difficult for the management scientist to be "pure," even if he is so inclined. Furthermore, the dilemma of precision *v.* communication is especially acute when the scientist must talk to the manager. Also, the manager may try his best to influence the direction the field will take. All of which leads one to conclude that the management sciences in all likelihood will have to develop their own peculiar methodology, and will not be able in time to rely on the traditional successful means of other disciplines.

MANAGUA, a small department in Nicaragua, bordering three sides of Lake Managua. Area 1,332 sq.mi.; pop. (1960 est.) 272,312. Population is 78.9% urban and is concentrated in the volcanic zone south of Lake Managua. With fertile volcanic soils, the department is important in producing coffee, dairy products, vegetables and fruits. Managua city, the departmental capital, is located on the southern shore of Lake Managua, in view of smoldering Mt. Masaya and the extinct volcanoes of Momotombo and Momotombito. (C. F. J.)

MANAGUA, capital of Nicaragua and of the department of Managua, is the largest city in the Central American republic. Pop. (1960 est.) 206,635. The city lies on the southern shore of Lake Managua (Xolotlán), which is 38 mi. long and 16 mi. wide, the lesser of the two great lakes which are one of the chief physical characteristics of the country. It is on the Pacific railroad, 87 mi. from the port of Corinto, and on the Pan-American highway. It is connected with the important cities of the world by airlines and has two airports, Las Mercedes (international) and

Xolatlán (local). Managua is the industrial and commercial centre of Nicaragua; its factories produce cotton fabrics, beer, cigarettes and matches. It is also the centre of an important agricultural region which produces cotton, rice and coffee; cattle are also raised and exported.

The city is located in beautiful surroundings between Lake Managua and the tiny lakes of Asososca, Nejapa and Tiscapa. Its climate is rather hot and humid during most of the year but many residents have built homes on the hills around the city, where the temperature is cooler. There are many new buildings of modern architecture, among them the communications palace and the social security building. The presidential palace and the U.S. embassy are on the southern outskirts of the city.

Managua's importance began in the late 1840s when it was used as a compromise capital in order to avoid the rivalry between Granada and León; it was established as the final site of the capital in 1855 after the war against William Walker (q.v.). The city was occupied almost continually between 1912 and 1933 by U.S. marines. In 1931, it was almost completely destroyed by earthquake and fire.

In addition to being the political capital of the country, Managua has been the religious capital since the beginning of the 20th century, when it was made the site of an archbishopric of the Roman Catholic Church. (M. F.-G.)

MANAKIN, any one of about 60 species of wren-sized birds, of the tropical forests from Mexico to Argentina, notable for the brilliant plumage of the males, often boldly patterned in combinations of red, yellow, blue, black or white. Manakins constitute the family Pipridae, which, with the closely related tyrant or New World flycatchers and the cotingas, form part of the more primitive section of perching birds (order Passeriformes). These short-billed, stout-bodied birds, most with very short tails, glean for insects among the leaves and twigs and also eat some fruit.

The males clear areas where they perform courtship displays. The dull-greenish females come to mate, then go their solitary way, each to make an open, cup-shaped nest in the fork of a branch, lay two spotted eggs in it and raise the young, which are hatched naked. (A. L. Rd.)

A. W. ANDLER FROM NATIONAL AUDUBON SOCIETY
SOUTHERN LONG-TAILED MANAKIN
(CHIROXIPHIA LINEARIS)

MANASSAS, a town and seat of Prince William county, Va., U.S., 25 mi. S.W. of Washington, D.C. The town, first known as Manassas Junction, came into being in 1853 when the Manassas Gap and the Alexandria, Orange and Midland railroads were joined. During the American Civil War this strategic junction afforded a direct connection between the Shenandoah valley and the railroad from Washington to Richmond. Confederate forces won the battles of First and Second Manassas (Bull Run, q.v.) nearby; the battlefields are preserved by the national park service. Manassas was incorporated as a town in 1873 and in 1892 it became the county seat, Prince William's fifth. It adopted a city-manager form of city government in 1927 and was rechartered in 1938.

Manassas with a population of about 3,500 is a trading centre for a general farming, dairying and stock raising area. Brushless generators are manufactured there. Many residents are government workers and skilled craftsmen who commute to Washington, the marine base at Quantico and other government installations. (G. M. BE.)

MANASSEH (in the Douai version of the Bible MANASSES), king of Judah. He became co-regent c. 697 B.C. during the reign of his father, Hezekiah (q.v.), sole king 687/686, and reigned till 643/642. That he maintained his position so long is a tribute to his statesmanship, and probably his kingdom prospered materially. Very little is heard about him, however, because his recognition of alien cults was a grave offense in the eyes of those who edited the historical writings. He is, indeed, held responsible

for the ultimate ruin of the kingdom. He was very much under the influence of Assyria, and documents from his reign unearthed at Gezer disclose the presence of Assyrians in his realm, the use of their language and method of dating. No doubt his introduction of the worship of the host of heaven and other Assyrian cults was dictated by political rather than religious motives. He may have been involved in the conspiracies of Shamash-shum-ukin, the rebellious brother of Ashurbanipal. If so, the account of his deportation to Babylon, and subsequent return (II Chron. xxxiii, 11-13) may be historical. Manasseh appears in inscriptions of Esarhaddon and Ashurbanipal as an Assyrian vassal. (W. L. W.)

MANASSEH (in the Douai version of the Bible MANASSES), a tribe of Israel, one of the two (the other being Ephraim) into which the house of Joseph was divided. The territory occupied by the tribe cannot be defined with precision. Machir, the "son" of Manasseh, seems to represent sometimes that part of Manasseh dwelling in central Palestine, sometimes an element of that part of the tribe dwelling east of the Jordan, and sometimes the whole tribe. Machir appears in the ancient poem Judg. v as taking part in the struggle against Sisera, and seems to have as neighbours Zebulun on one side, Ephraim and Benjamin on the other. From I Chron. vii, 14 it may be deduced that the tribe contained some Aramaean elements. See TWELVE TRIBES OF ISRAEL.

MANASSEH (MENASSEH) BEN ISRAEL (1604-1657), Jewish theologian and founder of the modern Jewish community in England, was born in Portugal, probably in Lisbon. His father was a marrano. The family later moved to Amsterdam, where Manasseh studied for the rabbinate under Isaac Uziel. Two years after the death of his master, Manasseh was chosen to succeed him as rabbi and teacher, though he was not yet 19 years of age. He acquired a reputation for his scholarship and theological argument, was one of the two principal teachers of Benedictus de Spinoza and numbered among his friends Isaac Vossius and Hugo Grotius. In 1627 he established the first Hebrew print shop in Amsterdam. He wrote prolifically, and many of his works were widely read.

Manasseh was convinced of an imminent return of the Jews to the Holy Land, according to messianic promise, but believed this depended first on a rescattering of the Jews into all countries. He was therefore interested in securing the readmission of Jews into England, where a ban on Jewish residence had existed since the edict of Edward I in 1290. Toward this end he wrote *Esperança de Israel* (1650; Eng. trans. *Hope of Israel*), which came to the notice of Oliver Cromwell and secured for Manasseh permission to visit England. There he pleaded his cause and eventually gained consent to end the debarment of Jews from living freely in England. In response to contemporary criticism, Manasseh wrote *Vindiciae Judaeorum* (*Vindication of the Jews*, 1656). After thus successfully concluding his mission in England, Manasseh returned to the Netherlands. He died in Middelburg, en route home, Nov. 20, 1657. A portrait etched by Rembrandt is extant.

MANASSES, CONSTANTINE (d. 1187), metropolitan of Naupactus, was an author of Byzantine "political" (i.e., 15-syllable) verse and of prose works. At the request of Manuel I's sister-in-law, he wrote a verse chronicle (*Synopsis historike*) from the creation to 1081. His verse romance on Aristander and Callithea survives in fragments only. He wrote a variety of other poems, as well as descriptive pieces in prose (some on works of art), and a number of orations, including an address to Manuel I and a funeral eulogy of Nicephorus Comnenus. Much of his work is unedited.

BIBLIOGRAPHY.—Chronicle ed. by I. Bekker in the Bonn corpus (1837) and in J. P. Migne, *Patrologia Graeca*, vol. 127 (1864); fragments of the romance ed. by R. Hercher, in *Scriptores erotici Graeci*, vol. 2 (1859); orations named above ed. by E. Kurtz in *Vizantiski Vremennik*, vol. 12, pp. 88-98 (1905) and vol. 17, pp. 302-322 (1915). Some of his other minor works are edited in various publications. See also K. Krumbacher, *Geschichte der byzantinischen Literatur*, 2nd ed., pp. 376-380 (1897); G. Moravcsik, *Byzantinoturcica*, 2nd ed., vol. 1, pp. 353-356 (1958). (J. M. Hv.)

MANASSES (MANASSEH), PRAYER OF, a short apocryphal book of the Old Testament. It purports to be the prayer of

Manasseh (*q.v.*), king of Judah, referred to in II Kings xxi, 1–18 and in II Chron. xxxiii, 1–20. This fine penitential prayer seems to have been modeled after the penitential psalms. It exhibits considerable unity of thought, and the style is, in the main, dignified and simple. The date of its writing is unknown. Some scholars assign it to the Maccabean period (2nd century B.C.), but its eschatology and doctrine of "divine forgiveness" may point to an earlier date; on the other hand, there are some indications of a doctrinal character which point to post-Maccabean times. The book was used in the early Christian Church, but was never included in the Vulgate Bible. See also APOCRYPHA, OLD TESTAMENT.

For the text, see H. B. Swete, *The Old Testament in Greek*, vol. iii (1894). See also H. E. Ryle in R. H. Charles (ed.), *The Apocrypha and Pseudepigrapha of the Old Testament*, vol. i (1913).

MANATEE (MANATI), aquatic mammals of the genus *Trichechus*, inhabiting the coasts and rivers of both sides of the tropical Atlantic and forming with the dugong (*q.v.*) the order Sirenia (*q.v.*). Although highly specialized in structure, the Sirenia have certain characters that indicate that they are perhaps distantly related to the elephants. The body of the manatee is fusiform in shape, rather flattened dorso-ventrally, with no externally visible neck. There are no hind limbs; the fore limbs are small flippers without separate fingers and the tail is expanded laterally to form a wide, rounded fluke, the principal organ of locomotion. The head is bluntly truncated at the front; the eyes are small and there is no external ear. The thick fleshy upper lip, beset with stiff bristles, is cleft vertically in the centre; the two halves can be separated or brought together and are used for seizing food and pushing it into the mouth. There are no canine teeth; the two-ridged molars may number as many as 20 pairs in each jaw, though few are in use at once, the posterior ones erupting as the anterior ones are worn out and lost. The body is covered with short, coarse, bristly hair, which is brownish or blackish according to the species; the total length usually ranges from 8 to 12 ft.

Manatees live singly or in small troops or family parties, swimming about slowly and grazing on aquatic plants. They are quite inoffensive creatures: where not habitually menaced they can be gently approached so closely that they have been described as very stupid animals. When

BY COURTESY OF NEW YORK ZOOLOGICAL SOCIETY

AMAZONIAN MANATEE (*TRICHECHUS INUNGUIS*)

alarmed they can remain submerged for as much as a half hour, though normally they surface to breathe about every 10 to 15 min. The extent of the territory of individual animals or troops is unknown but is probably extensive. Three species of manatee are known: *Trichechus senegalensis* inhabits the rivers and coasts of West Africa; *T. manatus* is found in the Caribbean from Florida to the West Indies; and *T. inunguis* ranges the coastal waters and rivers of the Guianas, the Amazon basin and farther south in Brazil. The female manatee gives birth to a single offspring each year, very rarely to twins, and suckles it at the pectoral mammary glands, sometimes clasping it to the breast with the flipper.

Manatees do not venture into the open sea; in large rivers they are found far into the interior of the continents. Their food is entirely vegetable and consists of aquatic plants and seaweeds. Locally they are valued for their flesh, which resembles pork, for their fat, from which oil is extracted for cooking and lighting, and for their hides. The manatee and dugong are said to have given rise to the legend of the mermaid. For an account of evolutionary relationships, see UNGULATE.

(L. H. M.)

MANATÍ, a town and municipality of Puerto Rico, situated in the northern part of the island, about 3 mi. from the Atlantic ocean. Pop. (1960) 9,682 (mun. 29,354). Manatí is located in a beautiful valley drained by the Manatí river. The name is of Indian origin and refers to a sea mammal called manatee in English. The soil of the rural area around the town is very fertile. Sugar cane and pineapple are extensively cultivated; coffee, grape-

fruit, oranges and bananas are also produced. Several important industries, including a shoe factory, have been established in the town.

(T. G. M.)
MANAUS (MANÁOS), a city and port of Brazil and capital of the state of Amazonas, is on the left bank of the Rio Negro, 12 mi. above its junction with the Amazon (Solimões) and 900 mi. above the mouth of the Amazon, in the heart of the Amazonian rain forest. Pop. (1960) 154,040. Manaus stands on a Tertiary terrace overlooking the river, 106 ft. above sea level, traversed by several *igarapés* ("canoe paths") or side channels that are spanned by bridges and divide the city into separate compartments. The climate is less oppressive than is commonly believed—the annual average temperature is 27.22° C. (81° F.), relative humidity 82% and average rainfall 75 in.

The National Institute for Amazon Research is located in Manaus. The majestic public buildings and homes, including the ornate opera house, where Caruso sang on opening night, date from the period 1890–1920 when the rubber boom brought wealth and luxury to Manaus. The port, which is the commercial hub of the entire upper Amazon region, was nothing but a river anchorage before 1902. In that year, an English corporation began improvements which included a stone river wall or quay, storehouses for merchandise and floating wharves or landing stages connected with the quay by floating bridges. The floating wharves and bridges are made necessary by the rise and fall of the river, the range between high and low waters reaching 50 ft. under extreme conditions. The principal exports are rubber, Brazil nuts, rosewood oil and jute; a host of minor forest products also move through the port. Cordage and coffee sacks are made in Manaus from locally grown jute. The city receives its beef from the savannas of the upper Rio Branco and from that region also come hides and horns for export.

Manaus is a regular stop on the shortest north-south air route between Miami, Fla., and eastern Brazil. It also serves as the hub of the well-developed air service of the Amazon valley. The port has direct steamship connections with New York and Great Britain and with all ports of the Amazon river system. A 5,000-bbl. refinery, built on a bluff below the city in 1956, refines crude oil barged down the Amazon from Peru. In 1955, oil was discovered at Nova Olinda, which is on the lower Madeira, about 110 mi. S.E. of Manaus.

The first European settlement on the site of Manaus was made in 1660, when a small fort was built there by Francisco da Motta Falcão and named São José do Rio Negro. The mission and village which followed were called Villa da Barra or Barra do Rio Negro ("barra" referring to the bar or mouth of the Negro). Manaus succeeded Barcellos as the capital of the old *capitania* of Rio Negro in 1809 and became the capital of Amazonas when that province was created in 1850, its name being then changed to Manaus after the principal tribe of Indians living on the Rio Negro at the time of its discovery. In 1892, Manaus became the see of the new bishopric of Amazonas.

(Js. J. P.)
MANCE, SIR HENRY CHRISTOPHER (1840–1926), British scientist and engineer, inventor of the heliograph, was born in London in 1840. He joined the Persian gulf telegraph department of the government of India in 1863 and was employed on laying the first submarine telegraph cables in the Persian gulf. He was the originator of the Mance method for detecting and localizing faults on submarine cables and wrote several papers dealing with this subject. His heliograph was used successfully during the Second Afghan War and subsequently adopted for general use in the British army. Mance was made a companion of the order of the Indian empire in 1883 and was knighted on his retirement in 1885.

A member of professional and scientific bodies, Mance was president of the Institution of Electrical Engineers in 1897. He died at Oxford on April 21, 1926.

(G. R. M. G.)
MANCHA, LA (Arabic AL MANSHA, "the dry land" or "wilderness"), in its widest sense denotes the bare and monotonous elevated plateau of central Spain that stretches between the mountains of Toledo and the western spurs of the hills of Cuenca, being bounded on the south by the Sierra Morena and on the

north by the Alcarria region. Altitude about 2,000 ft. It thus comprises portions of the modern provinces of Toledo, Albacete and Cuenca, and the greater part of Ciudad Real. Down to the 16th century the eastern portion was known as La Mancha de Montearagon or de Aragon, and the western simply as La Mancha; afterward the northeastern and southwestern sections respectively were distinguished by the epithets *Alta* and *Baja* (upper and lower). La Mancha remains almost exactly as Cervantes described it. Many villages, such as El Toboso and Argamasilla de Alba, both near Alcázar de San Juan, are connected by tradition with episodes in *Don Quixote*.

MANCHE, a coastal *département* of northern France, consisting largely of the westernmost districts of Normandy including the Cotentin peninsula and the Bocage Normand. The *département* is bounded west, north and northeast by the English channel (Fr. La Manche) from which it takes its name, east by the *département* of Calvados, southeast by Orne and south by Mayenne and Ille-et-Vilaine. Area 2,476 sq.mi. Pop. (1962) 446,878. Lying within the area of the Armorican massif, the *département* is composed of ancient folded rocks which weather to give poor, acid soils. The softer schist country of the Cotentin peninsula in the north is lower than the outcrops of granite and phyllade farther south in the Bocage Normand, but the highest parts in the southeast hardly reach 1,000 ft. Even so, the *département* is hilly and much dissected, the short streams flowing in deep-cut valleys. There are high cliffs along the coast, with offshore reefs making navigation dangerous. Farther to the west are the Channel Islands.

The climate is remarkably mild and damp, and the countryside is extremely verdant. Grain is unimportant and the *département* lies wholly north of the limit of viticulture. Although there are only fragments of woodland, trees are ubiquitous in the *bocage* countryside, a patchwork of little fields bounded by live hedges; apple orchards are widespread. Grass and fodder crops prevail and cattle are the mainstay of the farming, dairy produce being especially important. The sheltered low-lying ground of the Vire valley on the eastern margin of the Armorican massif is rich dairy-farming country. The rural population lives in hamlets and scattered farmsteads rather than in villages, and there are small market towns, such as St. Lô, Avranches, Valognes and Coutances.

Although granite is quarried at many places for road and building stone, and some iron-ore deposits occur in the extreme northwest at Diélette and in the southwest near Mortain, neither mining nor manufacturing is important. On the north coast the military port of Cherbourg has been developed as a *port de vitesse* for transatlantic passenger traffic, while Granville, on the west coast, beneath the fortified high town on a rocky promontory, is a seaside resort and fishing port with a trawling fleet. St. Vaast-la-Hougue in the northeast is a centre of oyster culture, and elsewhere there are fishing villages and small seaside resorts ranged round the rocky coast. Mont-Saint-Michel, with its picturesque Gothic abbey on a rocky islet attached to the shore by a long jetty, is a great tourist attraction. Although Cherbourg is by far the largest town, St. Lô in the Vire valley is the *préfecture* and Coutances is the centre of the bishopric, under the archiepiscopal jurisdiction of Rouen. For educational administration the *département* comes under the *académie* of Caen, and the court of appeal is also there. The *département* is divided into four *arrondissements*, centred upon Cherbourg, Coutances, St. Lô and Avranches. The towns of Manche suffered heavy damage in 1944 during the Allied invasion, but the 13th-century Gothic cathedral at Coutances largely escaped. At Lessay and St. Sauveur-le-Vicomte there are noteworthy remains of ancient Benedictine abbeys.

(AR. E. S.)

MANCHESTER, EARLS AND DUKES OF. The Manchester title, in the English peerage, belongs to a branch of the family of Montagu. The first earl was SIR HENRY MONTAGU (c. 1563–1642), grandson of Sir Edward Montagu, chief justice of the king's bench 1539–45. He was born at Boughton, Northamptonshire, was educated at Christ's college, Cambridge, and was called to the bar. He was elected recorder of London in 1603 and was made chief justice of the king's bench in

1616, in which office he passed sentence on Sir Walter Raleigh in 1618. In 1620 Montagu was appointed lord high treasurer, being raised to the peerage as Baron Kimbolton and Viscount Mandeville. He became president of the council in 1621, and Charles I created him earl of Manchester in 1626. He became lord privy seal in 1628 and in 1635 a commissioner of the treasury. He was a judge of the Star Chamber, and one of the most trusted councilors of Charles I. In conjunction with Lord Coventry, the lord keeper, he pronounced in favour of the legality of ship money in 1634. He died on Nov. 7, 1642.

EDWARD MONTAGU (1602–1671), 2nd earl, eldest son of the 1st earl by his first wife, was educated at Sidney Sussex college, Cambridge. He was member of parliament for Huntingdonshire 1624–26, and in the latter year was raised to the peerage as Baron Kimbolton, but was known generally by his courtesy title of Viscount Mandeville. At the beginning of the Long parliament he was a leader of those opposed to the king in the upper house, his name being joined with those of the five members of the house of commons whom the king charged with treason in 1642. At the outbreak of the Civil War (see CIVIL WAR, ENGLISH), having succeeded his father in the earldom in Nov. 1642, Manchester commanded a regiment in the army of the earl of Essex, and in Aug. 1643 he was appointed major general of the parliamentary forces in the eastern counties, with Oliver Cromwell as his second in command. He became a member of the "committee of both kingdoms" in 1644, and was in supreme command at Marston Moor (July 2, 1644); but he later disagreed with Cromwell, and in Nov. 1644 strongly expressed his disapproval of continuing the war. Cromwell brought his shortcomings before parliament in 1644; and early in the following year Manchester, as a result of the Self-Denying ordinance, resigned his command. He took a leading part in the frequent negotiations for an arrangement with Charles and, with William Lenthall, was custodian of the great seal (1647–48). He opposed the trial of the king, and retired from public life during the Commonwealth; but after the Restoration, which he actively assisted, he was honoured by Charles II. In 1667 he was made a general. He died at Whitehall on May 7, 1671.

CHARLES MONTAGU (c. 1662–1722), 1st duke, grandson of the 2nd earl, was educated at St. Paul's school and Trinity college, Cambridge, and succeeded to his father's earldom in 1683. He fought under William III at the battle of the Boyne, became a privy councilor in 1698 and held various important diplomatic posts between that date and 1714, when he received an appointment in the household of George I, by whom in 1719 he was created duke of Manchester. He died on Jan. 20, 1722. GEORGE MONTAGU (1737–1788), 4th duke, grandson of the 1st duke, was a supporter of Lord Rockingham, and an active opponent in the house of lords of Lord North's American policy. In the Rockingham ministry of 1782 he became lord chamberlain. He died in Sept. 1788. WILLIAM MONTAGU (1771–1843), 5th duke, third son of the 4th duke, was educated at Harrow, and entered the army. He became a colonel in 1794 and was appointed governor of Jamaica in 1808. He remained there until 1827, doing much to prepare the way for the emancipation of the slaves. From 1827 to 1830 he was postmaster general in the cabinet of the duke of Wellington. ALEXANDER (1902–), 10th duke, succeeded to the title in 1947.

MANCHESTER, a cathedral city and county borough in Lancashire, Eng., lies 184 mi. N.W. of London and 35 mi. E. of Liverpool by road. The adjacent city of Salford (*q.v.*) is separated from Manchester by the river Irwell. Pop. (1961) 661,041.

The city of Manchester stands at the junction of the rivers Irwell, Irk and Medlock. Before the last Ice Age, a range of high mountains closed the approaches to Manchester's site on the north and east. Glacial action ground down and flattened them to a height of 1,000–2,000 ft. and glacial streams carved deep clefts and valleys, whose streams converge on the area that is now the Manchester district. There, where nature had laid down its own lines of communication, and where the high land gave way to the former estuarine marshes, making a natural defensive position, the settlement of Manchester first arose. The city varies from

100 ft. above sea level in the south to 400 ft. in the north, the height at the centre being 133 ft. Bordering the south of the city is the fertile Cheshire plain: to the east, north and west is the huge east Lancashire industrial area.

Manchester is built on Triassic, Permian and Carboniferous rocks, which often reach the surface, but which are usually overlaid with thick deposits of glacial drift-sands, gravel and boulder clay. Industrial water is obtained in part from wells in the Triassic rock, but the bulk is piped from Thirlmere in Cumberland, Haweswater in Westmorland, and the Longendale valley in the Pennines. The whole region is seamed with coal, and one of England's largest coal mines lies within the city boundary. The city enjoys a temperate climate varying from 25° F. (-4° C.) to 72° F. (22° C.). It has an average rainfall of about 30 in. each year, but with sunshine somewhat reduced by the prevalent cloudy conditions. In 1952 the city centre was made the first effective smokeless zone in Great Britain; by the mid-1960s this had been extended to 9,500 ac.

History.—An early name for Manchester—Mancenion—is believed to have been taken from that of a Celtic settlement on the site, known as "the place of tents." One of the principal Roman roads from Chester northward passed through Manchester—a portion of it is still known as Watling street—and the Romans established in A.D. 79 a fort, small portions of which still remain, to safeguard military and trading traffic through the area. The Romans gave to Mancenion their own version of the name, Mancunium, and the inhabitants are still referred to as Mancunians. They were in occupation for about 350 years and from then onward there was little of note to relate until 870, when the Danes destroyed the town, except that the place was brought under the dominion of the Saxons early in the 7th century and named, in various forms, Mamecaster or Memcestre. Edward the Elder rebuilt Manchester in 920, and the right to coin money was granted to Manchester's citizens by King Canute. In the Domesday survey of 1086, Manchester is mentioned as an area poor and sparsely populated.

In 1229 the town was granted an annual fair by Henry III, and immigrant Flemish manufacturers chose the area for the establishment of their textile industry in 1330, thus giving the first evidence of the suitability of the area for textile production. The introduction about 1500 of vegetable cotton, known as cotton wool, must have been a stimulus to trade, for the antiquary, John Leland, reported to Henry VIII that Manchester was "the fairest, best builded, quikkest and most populous towne in all Lancashire." It is quite evident that Manchester's industry at the time was confined entirely to textiles, for a publication dated 1650 lists the town's manufactured products as "woolens, frizes, fustians, sack-cloths, mingled stuffs, inkles, topes and prints," and in 1690 the art of calico printing was introduced from France. That event marked the beginning of Manchester's rise to importance.

Modern Manchester is one of the results of the Industrial Revolution which transformed the place, in a generation, from a market town to a thriving industrial centre. The discovery and exploitation in the late 1700s of steam power, and the opening up of road, river and, later, rail communications went hand in hand with the invention of devices for the mechanical manufacture of textiles. In 1761 the first English "navigation" or canal was opened to bring coal into Manchester from the duke of Bridgewater's estate at Worsley. In 1785 the culminating invention of the power loom for weaving was made, and in 1789 the first steam engine for spinning cotton was erected in Manchester. In St. Peter's fields, Manchester, occurred the famous "massacre" of Peterloo (*q.v.*) in 1819. The *Manchester Guardian* newspaper (now *The Guardian*), which began publication in 1821, became, under the editorship of Charles Prestwich Scott, one of the leading journals of the day, of Liberal views.

Manchester's attainment of municipal borough status in 1838 was mainly due to Richard Cobden. In 1837 he first emerged as a public figure when he led the struggle for Manchester's incorporation as a borough. His being summoned as a juror to the manorial court leet made him aware of the hopeless inadequacy of manorial rule in an industrial town. He then had a declara-

tion drawn up, later signed by his fellow jurors, which criticized the existing system of local rule and was followed by his celebrated pamphlet, *Incorporate Your Borough*. This movement for incorporation resulted, at the beginning of 1838, in a public meeting at which Cobden was the principal speaker, to discuss the advisability of petitioning the queen for a charter of incorporation. Despite much opposition and the forgery of signatures to an anti-incorporation petition, the charter was eventually granted in Oct. 1838; Cobden was elected as a councilor for the St. Michael's ward and elevated to the aldermanic bench after one day's service as councilor. He remained on the borough council until 1844. After the incorporation of the borough Cobden became closely associated with John Bright, the son of a Lancashire cotton spinner, in the formation of the National Anti-Corn Law league. While Bright was famous as a national figure, his local connection with Manchester was confined to representing the borough in parliament in the 1847 and 1852 elections.

The so-called "Manchester school" of political and economic liberalism led by Cobden and Bright advocated free trade and unrestricted competition.

Other notable occasions in Manchester's history were the opening in 1851 of Owens college (later developed as the University of Manchester), the rise to city status in 1853 and to that of county borough in 1888, the bestowal of the title of lord mayor as the head of the city's government in 1893, the completion of the Manchester Ship canal in 1894, the commencement of the city's first satellite town at Wythenshawe in 1929 and the opening in 1938 of Manchester airport at Ringway.

In World War II the oldest part of the city—that round the original market place—together with the warehouse quarter near Piccadilly, the assize courts, the Royal exchange and the Free Trade hall, were badly damaged in air raids. Rebuilding and repair have since been completed.

Until the Reformation Manchester lay in the diocese of Lichfield, but in 1541 Henry VIII founded the diocese of Chester, which included the whole of Lancashire. Because of the increase in population caused by the Industrial Revolution, a new Anglican see of Manchester was formed in 1847. This diocese covered the greater part of Lancashire and the collegiate church became the cathedral. The northerly part was transferred in 1926 to the new diocese of Blackburn. Hulme and Middleton are bishoprics suffragan. From 1921 to 1929 William Temple, who was translated to York and later to Canterbury, was bishop of Manchester.

The Roman Catholic community is large, but its cathedral is in the neighbouring city of Salford, and the principal Roman Catholic church is that of the Holy Name. The city has long been a stronghold of nonconformity, and the Baptist, Christian Science, Congregationalist, Jewish, Methodist, Presbyterian, Unitarian and Free Christian congregations are considerable.

Architectural Features.—Few traces of medieval Manchester remain. Chetham's hospital and library occupy stone-built medieval buildings which were the ancestral home of the Grelle (Gresley, Grelley) and De la Warr (Warre) families, and were presented to the church of Manchester when it became collegiate in 1421; they were purchased by the Chetham trustees in 1653.

Manchester's cathedral is not externally imposing, but its history as parish church, college of priests and cathedral is long and interesting. An important church is thought to have stood there in the 10th century. There are no relics of Norman work, but there is evidence of a large Early English church. In 1421, chiefly through the efforts of Thomas de la Warr, who was rector and lord of the manor, a royal licence and charter was obtained, making the church collegiate and endowing it with extensive lands. Warden James Stanley, afterward bishop of Ely, built the present choir in 1485. During the 15th and 16th centuries nine chapels were built. The east end of the cathedral was severely damaged during World War II but repairs have been completed. The Manchester Regiment chapel, also bombed, was rededicated in 1951.

The Wellington inn in the market place, Wythenshawe hall at the southern edge of the city, Slade hall, Barlow hall and Hough End hall are among the few remaining early buildings. Of the Georgian period there are a number of notable individual build-

ings: Heaton hall, in Heaton park, is a splendid example of the work of James Wyatt and is furnished in the character of the time. Platt hall, Rusholme, was the home of the Carrill-Worsley family. St. Thomas' church, Ardwick, and St. Ann's church are outstanding examples of this style. The City Art gallery and the adjoining Manchester Athenaeum building are to the design of Sir Charles Barry, and the Portico library, the Friends' Meeting house, the District bank in King street and the Bank of England also belong to Georgian days. Notable Victorian buildings include the town hall, built in 1877 to the design of Alfred Waterhouse. In the fine great hall are frescoes by Ford Madox Brown of incidents in the history of, or connected with, Manchester. The university main buildings are by the same architect. The John Rylands library, designed by Basil Champneys, is in severe Gothic revival style. The Manchester Royal exchange, built in 1874, was extended in 1914-21; rebuilt after bomb damage, the great hall (the floor of which accommodated more than 12,000 members in the flourishing years of the cotton industry) was reduced in size and can now accommodate about 5,000 members on "high 'Change," the remaining space being occupied by offices.

Of Manchester's 20th-century buildings, among the finest are the town hall extension and Central library; the latter was opened in 1934. The Midland Bank building, to the design of Sir Edwin Lutyens, stands at the upper end of King street with the adjoining Ship Canal house. The modern concert hall, rebuilt in 1951 within the walls of the bombed Free Trade hall of 1856, was designed by Leonard C. Howitt.

Albert Bridge house is the home of several central government authorities, and Piccadilly centre has a shopping precinct, hotel, conference hall, roof gardens, and an office block nearly 350 ft. high. The new Co-operative Insurance building is 400 ft. high. The bombed assize courts have been rebuilt as the courts of justice on a new site near the city centre, while other notable new buildings are Peter house in St. Peter's square, the Domestic and Trades college in Fallowfield, and Granada house, headquarters of the Granada Television network.

Administration.—In 1301 the lord of the manor, Baron Thomas, Lord Grelle, yielded to the pressure of the burgesses a charter appointing town's officers, making rules for the management of the town and defining the functions of the courts. Even so, it was not until the late 18th century that centrally appointed town's commissioners took over the local government of the place. They failed to govern the town satisfactorily and when the Municipal Corporations act of 1835 offered opportunity, the movement led by Cobden and other notable reformers secured the incorporation of Manchester as a municipal borough.

The city council, responsible for the local administration of a densely populated area of about 43 sq.mi., has 152 members, 38 of whom are aldermen and 114 councilors. One of the councilors is usually chosen to be the lord mayor for a year. The municipal markets at Smithfield and elsewhere distribute foodstuffs throughout the northwest of Britain. The southerly suburb of Wythenshawe, transferred from Cheshire to Manchester in 1930, was planned as a "new town" with a projected population of 100,000, and with its own industrial areas and civic centre. The city's parks and open spaces have an acreage of 2,482 in which are included Heaton park of 638 ac. and Wythenshawe park of 251 ac. As the chief city of northwest England, Manchester houses the regional offices of 9 government ministries and the local offices of 38 other government departments; there are a court of assize and a district registry of the high court of justice, and six other courts of law. By the early 1960s 19 countries had consular representation in Manchester.

With the exception of the parliament of 1654, Manchester had no representation until the Reform bill of 1832 when it sent two representatives. In 1868 this was increased to three. In 1885 the city was divided into six divisions and in 1918 into ten divisions, each returning one member. By the Representation of the People act, 1948, the number was reduced to nine: Blackley, Clayton, Gorton, Ardwick, Withington, Moss Side, Exchange, Cheetham and Wythenshawe. In 1955 Openshaw replaced Clayton.

Cultural Life.—Manchester is famous for its many private, public and specialized libraries. The municipal libraries, with 26 branches, have as their focus the building in St. Peter's square opened in 1934. This central building is the home of a reference library which includes the Greenwood library for librarians, a commercial library and a technical library to serve the industrial and commercial interests of the region, a lending library, and the music library presented to the city by Henry Watson in 1902. The music library, which includes the Chapman collection of musical instruments, contains a comprehensive selection of rare and early music. Other libraries in the central building are the Arts library, Local History library, Jewish library, Special Collections library, American library, Patents and Microtext library.

The John Rylands library in Deansgate was built by the widow of John Rylands, a Manchester merchant, in memory of her husband. Opened to readers on Jan. 1, 1900, the library is a place of pilgrimage for scholars and bibliophiles. Its basis is the Althorp library collected by the 2nd Earl Spencer, and the earl of Crawford collection of manuscripts, together with incunabula, bibles from the Gutenberg Bible onward, works of the 16th-century scholar-printers and the de luxe printers of the 17th and 18th centuries and of modern times. It also contains historical pamphlets of the 17th and 18th centuries; records on clay, bark, bamboo, papyrus, parchment and other materials in 50 languages from the 3rd millennium B.C. onward; legal documents and family muniments from the 11th to the 20th centuries; medieval jeweled bindings; and extensive collections of historical, political and literary papers including 3,000 letters of the Johnsonian circle and of Charles Dickens, John Ruskin and other well-known figures.

The University of Manchester's library is located in various buildings; the science section is in the Christie building, and there is a special library for the education of the deaf. Chetham's library, at Chetham's hospital, Fennel street, founded in 1653 under the will of Humphrey Chetham, a Manchester merchant, was one of the first free public libraries in England, if not in Europe, and unlike the others is substantially in its original setting. At first the books were chained and the stools used by readers in those days are still preserved. Its great strength lies in the collections of printed books of the 16th, 17th and 18th centuries, and in both old and modern books on local history and related subjects. The Portico library in Mosley street was opened in 1806; the first secretary was Peter Mark Roget, the author of *Thesaurus of English Words and Phrases*. Among the members down the years were John Dalton, the physicist, and the Rev. William Gaskell, whose wife, Elizabeth, wrote *Cranford* and other novels of Victorian life. The library contains an unusual collection of rare historical treatises, ancient medical tracts and curiosities of many kinds.

The City Art gallery, formerly the Royal Manchester institution, was opened to the public in 1829 and presented to the corporation in 1882, together with the nucleus of the present art collection. Subsequent purchases have been supplemented by numerous gifts and bequests, notably that of contemporary works presented by Charles L. Rutherford in 1925 for use as a lending library from which pictures and sculpture could be borrowed by schools, colleges of art and galleries in the north of England. There are a number of branch galleries. The gallery of English costume at Platt hall, opened in 1947, is the first and largest institution in Britain to be solely concerned with that art and is based on the fine collection of English costume formed by C. Willett Cunnington. Heaton hall contains a display of Georgian painting, furniture, pottery, silver, porcelain and glass, as well as a fine Georgian two-manual organ. At Queens Park gallery a display of pictures, maps, models and other objects illustrates the past history of Manchester. The Manchester Whitworth institute, now the Whitworth Art gallery and part of Manchester university, was founded in Oct. 1889 under the will of Sir Joseph Whitworth. It contains early textiles and embroideries, and a collection of English water-colour drawings. The Manchester museum, which evolved from collections of the Manchester Society of Natural History (founded 1821), is now a university department and a public museum. It has special exhibits of Egyptian, ethnological

and Japanese objects as well as important natural history collections.

Upon the choral singing and brass bands of south Lancashire, which amount almost to a folk tradition, was superimposed, in the middle of the 19th century, a foreign musical culture arising from the immigration of German and central European merchants. From this period survives the Hallé Concerts society, formed in 1898, to keep in being the orchestra inaugurated in 1858 by Sir Charles Hallé. The Hallé orchestra, under its conductor, Sir John Barbiroli, has become an international orchestra. The B.B.C. Northern orchestra is another major symphony orchestra in the city. The Tuesday Mid-day Concerts society has given weekly concerts since 1916 at which many artists later to become world famous have been introduced to the public. The Manchester Royal College of Music is the only body in England outside London whose diplomas are recognized as qualifying the holder for a professional career in music.

Manchester has two theatres and a resident repertory company in a municipal "little theatre" at the central library. There is a wealth of private bodies for the furtherance of literature, art and kindred subjects, notable among which are the Ancient Monuments society, the Chetham (Printing) society, the Classical association, the Academy of Fine Arts, the Manchester Institute of Contemporary Arts and the Manchester Literary and Philosophical society (which has a long and notable history and among whose past members were John Dalton, who died in Manchester, and Thomas de Quincey, who was born there).

Cycling and other athletic events are promoted at the stadium in Fallowfield: there are two Association Football clubs (Manchester United and Manchester City) and at the ground of the Lancashire County Cricket club, Old Trafford, a test match is played against overseas cricket teams visiting Great Britain. At Belle Vue in West Gorton are large zoological gardens, an amusement park, exhibition halls and restaurants.

Education and Research.—The oldest educational institution in Manchester is the grammar school, founded in 1515 by Hugh Oldham, bishop of Exeter. Moved to new buildings at Rusholme in 1931, it now accommodates more than 1,200 boys. Another ancient educational foundation is that of Humphrey Chetham, whose Bluecoat school, founded in 1653, is housed in the building formerly occupied by the college of clergy and is now a grammar school. The educational charity of William Hulme (1631–91) is administered under a plan drawn up in 1881 and supports a grammar school. The College of Art has been redesignated the Regional College of Art. There are three recognized colleges of music. Schools for the deaf and dumb are situated at Old Trafford next to the blind asylum, to which Thomas Henshaw left a bequest of £20,000. There are also an adult deaf and dumb institution and a branch of the National Library for the Blind.

The University of Manchester, officially the Victoria University of Manchester, has developed from the college founded by John Owens, who in 1846 bequeathed nearly £100,000 to trustees for an institution in which should be taught "such branches of learning and science as are usually taught in the English universities." It was opened in 1851 in a former residence (now the Manchester county court) of Richard Cobden in Quay street, but such was the expansion of the college that a new building was erected in Oxford road and opened in 1873. In 1880 a university charter was granted and the Owens college was constituted a college of the university. In 1884 University college, Liverpool, was admitted and in 1887 the Yorkshire college, Leeds. The Federal institute thus created lasted until 1903, when a separate university was established in Liverpool. In 1904, when the Yorkshire college was raised to university rank, the Owens college was incorporated with the Victoria University of Manchester by act of parliament.

The chairs instituted since 1945 range from such subjects as radio astronomy, nuclear and other forms of engineering, various branches of chemistry and preventive medicine and dentistry, to the social sciences, music, ecclesiastical history and the study of foreign literatures and languages. University students number 8,500 including those who attend the College of Science and Technology which comprises the faculty of technology of Victoria uni-

versity. The college was founded as a mechanics institute in 1824.

There are in Manchester a number of denominational colleges and many of the students preparing for the ministry receive their arts training at the university.

Manchester is a notable centre for research. It has played a major part in the development of atomic physics from 1803, when John Dalton propounded the atomic theory of matter (published in 1805 with a list of atomic weights) to the Manchester Literary and Philosophical society, onward. During 1908–19 Ernest Rutherford, later Lord Rutherford, was professor of atomic physics at Manchester university and there he first split the atom. Henry Gwyn-Jeffreys Moseley worked with Rutherford from 1910 to 1914 and Niels Bohr from 1912 to 1913. Sir James Chadwick was born in Manchester and Sir John Douglas Cockcroft was educated at the university. James Prescott Joule discovered in 1843 the mechanical equivalent of heat. A firm in Manchester, in co-operation with Manchester university, designed and now produces electronic computers.

The Shirley institute at Didsbury deals with the problems of cotton, silk and all man-made fibres, including synthetic fibres; the Cotton Board Colour, Design and Style centre in York street co-ordinates the many facets of the design of fabric patterns and of the styling of cotton materials into women's wear and household materials; the university and the College of Science and Technology co-operate in industrial research with the chamber of commerce. The research work of the Lancashire and Merseyside Industrial Development association makes known the potentialities of the area. The United Manchester hospitals, a group separate from the national scheme and centred round the Manchester Royal infirmary, join with the university in medical research; at the Christie cancer hospital and Holt Radium institute, Didsbury, is one of the largest centres of cancer research in the commonwealth; a research fellowship in poliomyelitis was set up by the university in 1954. At Jodrell Bank, Cheshire, the department of astrophysics of Manchester university has established a pioneer radio-astronomy observatory and has built one of the world's biggest steerable radio-telescopes, about 260 ft. across and on a movable track: it was the only one in the west able to track the earlier space satellites of the U.S.S.R. (1957) and of the United States (1958).

Industry, Commerce and Transport.—Manchester's importance arose primarily from the textile industry. In the 12th century locally produced wool was made up into cloth and garments until the introduction of cotton as a wool substitute, when the wool industry gradually moved into Yorkshire. The spinning, weaving, bleaching, dyeing, printing and finishing of the cloths is now carried out in the towns of south Lancashire, after which they come to Manchester for warehousing, packing and shipping, but this trade now engages only about 7% of the regional population.

Manchester, therefore, provides banking, insurance, marketing and shipping facilities for the whole of south Lancashire's industry based on the surrounding towns of Bolton, Oldham, Stockport, Ashton, Rochdale, Eccles, etc. On its own account it has extensive businesses of heavy and light engineering, factories for clothes, chemicals and dyestuffs, oil refining and food processing plastics and electronics. The city is a centre of journalism second only to London. It is the north regional headquarters of the British Broadcasting corporation and Associated British Corporation Television, Ltd., and also the national headquarters of the Granada Television network.

The development of local industry was paralleled by the establishment of a network of road, rail and canal transport to bring in the raw materials and to take away the finished products. The Manchester-Liverpool line of 1830 (of which the Liverpool Road station still remains as the first and oldest railway station in the world) was followed by lines to Birmingham, London, Yorkshire and the north; Manchester now has four major mainline stations (Piccadilly, Central, Victoria and Exchange), two of which were entirely rebuilt in 1959–60. The canal system began in 1761 with the Bridgewater canal, designed by James Brindley, and was followed in 1767 by a second length dug from Stretford to Runcorn. A third section joined the canal with the Leeds-Liverpool canal.

early in the 19th century. Since the opening of the Manchester Ship canal (*q.v.*) in 1894, the barge canals have fallen into disuse, but the access to Manchester, via the ship canal, of ocean-going vessels of up to 15,000 tons dead weight has laid the foundation of the region's continued prosperity.

The port of Manchester should be regarded as an elongated harbour, including as it does the whole of the 36-mi. Manchester Ship canal from the entrance locks at Eastham on the Mersey estuary to the terminal docks in Manchester. It is now the nearest port (54 mi. from the open sea) for an area containing the main mass of British industry and extending as far as Birmingham to the south and Wakefield in Yorkshire to the east. In that first year of 1894, the cargo entering the port amounted to 925,000 tons, it now exceeds 15,000,000 tons. With the coming of the oil industries to Stanlow in 1949 Manchester grew as an oil port. In 1896, Trafford park, a country estate adjoining the Manchester docks, was purchased to become the first and greatest planned industrial estate in Great Britain.

The first municipal airport in Great Britain was established at Wythenshawe in Manchester in 1929. The present Manchester airport at Ringway, 10 mi. S. of the city by road, is the largest municipally owned airport in England and is second to London in the amount of traffic, both passenger and freight, handled. More than 1,000,000 terminal passengers a year use the airport. Scheduled services operate to continental and domestic destinations. Inclusive holiday tours operate throughout the summer period. Ringway became a transatlantic airport in 1953 and by the 1960s there were regular passenger and freight services to the United States and Canada.

MANCHESTER, largest city in New Hampshire, U.S., and one of the seats of Hillsborough county, is located in the centre of the state at Amoskeag falls on the Merrimack river, midway between Nashua and Concord, and 54 mi. N. of Boston. The Amoskeag falls, originally Namoskeag, Indian for "place of much fish," drop from a ledge 85 ft. high across the Merrimack river providing water power for industrial developments. Pop. (1960) 88,282. The standard metropolitan statistical area (SMSA), consisting of Manchester and Goffstown, had a population in 1960 of 95,512. In 1963 Bedford and Hooksett towns were added to the SMSA, making its population (according to the 1960 census) 102,861. For comparative population figures see table in **NEW HAMPSHIRE: Population**.

The first white settlers (Scotch-Irish) came in 1722-23. Through its early years the settlement was known for its fisheries. First called Old Harry'stown, it became Tyngstown after 1735 when it was granted to Capt. William Tyng's men by the Massachusetts Bay colony. In 1751 the settlement was incorporated as Derryfield. It was apparently renamed Manchester in 1810 at the suggestion of Samuel Blodget, who had seen the barge canals at Manchester, Eng., and who after 16 years of effort and aided by lotteries planned and constructed (1794-1807) the first canal around the falls, which together with the Middlesex canal in Massachusetts made navigation possible all the way to Boston.

It was chartered as a city in 1846. The Scotch-Irish community of potato and flax-raising farms emerged into a rapidly growing metropolis with riverside factories whose principal industry, the Amoskeag Manufacturing company with 18 mi. of water rights and numerous mills, employed 15,000 persons and reached a peak production of 360 mi. of cotton cloth a day, a prosperity augmented by the manufacture of shoes, cigars, locomotives and fire engines.

The downfall of Manchester's textile industry in 1935 caused by shrinking markets, foreign competition and the advent of silk and rayon, together with the disastrous floods of 1936 and the

hurricane of 1938 awakened the city to the need for rehabilitation. In 20 years as a result of energetic action by civic leaders who bought the Amoskeag mills and leased many of them to small business enterprises, metropolitan Manchester was planned and rebuilt, and became an industrial and shopping centre for more than 106,000, with about 25% of the state's population residing within a radius of 20 mi. By the early 1960s Manchester had more than 200 industrial establishments manufacturing textiles, leather goods, rubber, automobile accessories, electrical instruments, confectionery, beverages and dairy products.

The city has 479 ac. of public parks, including Stark park, the burial place of Gen. John Stark, and within its limits is Massabesic lake, the source of its water supply. It is the home of the Manchester Institute of Arts and Sciences, the State Industrial school, Currier Gallery of Arts, Manchester Historic association, St. Anselm's college (Roman Catholic; 1889) and the John Stark homestead. (E. M. Hu.)

MANCHESTER SHIP CANAL, an important artificial waterway affording passage for ocean-going vessels between the Mersey estuary (opening into the Irish sea) and the inland city of Manchester, Eng. The canal was begun on Nov. 11, 1887, to provide a port for Manchester's rapidly expanding textile industry and was opened to traffic on Jan. 1, 1894. It is 36½ mi. long and has a minimum depth of 28 ft. Extensive docks, dry docks, wharves and warehouses line the canal. See **WATER TRANSPORT, INLAND**.

MANCHOUKUO, a former state, created as nominally independent in 1932 by the Japanese out of old Manchuria and Jehol. Dissolved after World War II and subsequently divided by the Peking government into the provinces of Heilungkiang, Kirin, Liaoning and Jehol and the Inner Mongolian autonomous region. In 1955 Jehol was abolished and absorbed into Inner Mongolia, Liaoning and Hopeh. See **MANCHURIA**; **MONGOLIA, INNER**; and articles on the political divisions.

MANCHU LANGUAGE. Manchu belongs to the southern group of the Tungusic languages (see **URAL-ALTAIC LANGUAGES**). Tungusic peoples probably inhabited the present Manchuria by the 3rd century B.C. The predecessors of the Manchus were the Nü-chên (Dürchen, Jurchen), who usurped the empire of the Khitan dynasty in the 12th century and ruled as the Chin dynasty till mid-13th, being overthrown in turn by the Mongols. (See **MANCHUS**; **SUNG**.) The real founder of Manchu power was Nurhachi, who proclaimed himself emperor in 1616 and established his capital at Mukden in 1625. Under his reign the Manchus adopted for their own use the Mongolian alphabet which they inherited from the Uighurs. In the course of time changes were made in order to adapt this writing to the Manchu language, and in its final form it became far more elaborate and serviceable than its Mongolian prototype. Books had been printed in Manchu by 1647. The two emperors K'ang-hsi and Ch'ien-lung did most to establish and stereotype this somewhat artificial language by causing translations to be made of Chinese and Mongolian works and by the publication of numerous polyglot dictionaries. All officials had to pass an examination in Manchu. All imperial decrees and most official documents were issued in this language in addition to Chinese.

With the abdication of the young emperor P'u-i and the proclamation of the republic in 1912, Manchu may be said to have disappeared from China proper. It is, however, still spoken in parts of northern China, Manchuria and elsewhere. Regarded as a dead language, Manchu has received a considerable amount of attention from European scholars because the literal translations made into that language from the Chinese classics have simplified the interpretation of the latter.

The vocalic harmony is not so strictly observed in Manchu as in Mongolian, and in the case of grammatical suffixes there are in some instances no alternative hard or soft forms. The suffixes are as follows: accusative *be*; genitive instrumental *i* or *ni*; dative locative *de*; ablative *ci*. The Manchu verb, like the Chinese, does not distinguish either person or number, the tenses are imperfectly expressed and general notions are conveyed by adverbial and participial forms. Manchu has no relative pronoun and ex-

presses a relative preposition as any other subordinate clause by means of participles.

Manchu, like the other Altaic languages, adds suffixes to the verbal theme to form derived verbs or gerunds expressing some extended meaning; thus the syllable *bu* added to *ara* ("to write") gives *arabu* ("to cause to write") and the syllable *na* added to *wa* ("to kill") gives *wana* ("to go to kill"), etc. A peculiarity of Manchu is the indication of masculine and feminine, or strong and weak, by the alternation of the vowels *a/e*: thus, *ama* ("father") and *eme* ("mother"). Even foreign words undergo this change: the Turkish *arsalan* ("lion") is modified into *erselen* ("lioness"); Sanskrit *garudai* ("male phoenix") becomes *gerudei* for the female phoenix; *ganggan* ("strong") becomes *genggen* ("weak"); and *wasime* ("to descend") becomes *wesime* ("to climb").

H. M.)

MANCHURIA is the name given by westerners to northeastern China, historic homeland of the Manchus, rulers of China between 1644 and 1912. There is no direct Chinese equivalent for the word. The Chinese call the region either Tung-pei, the North-east, or the Three Eastern provinces.

Manchuria has been the great frontier region of modern China. Only in the latter half of the 19th century were its eastern and northern boundaries firmly defined, and its western boundaries are still undergoing change. The southeastern political boundary is shared with Korea and has been stabilized since the late 14th century. It follows the Yalu river from its entry into the Yellow sea northward nearly to its source; it then crosses the mountainous water parting between the drainage basins of the Yalu and Tumen rivers, touching the famous Pai-t'ou shan (White Top mountain, 9,003 ft.); finally, it follows the Tumen river to within 20 mi. of the Sea of Japan. Manchuria, however, does not have direct access to the Sea of Japan, being separated from it by both Korea and the U.S.S.R. The northeastern boundary runs northward from the Tumen across the hilly grain of the country to Lake Hanka (Khanka), source of the Ussuri river, and then north along the Ussuri to its junction with the Amur river (Hei-lung chiang). This section of the boundary was established by the treaty of Peking (1860). Manchuria's northern frontier, as established by treaty in 1689 and 1858, follows the Amur from its junction with the Ussuri westward to the Argun river, which continues for most of its course as an international frontier between China and the Soviet Union. Southern Manchuria fronts upon the Po Hai (Gulf of Chihli).

Under the Republic of China prior to 1928 the western frontier continued southward from the Argun river in the north across the eastern Mongolian plateau and then looped southeastward around the hills of Jehol. Manchuria at that time consisted of three provinces: Liaoning (until 1928 Feng-t'ien), Kirin (Chi-lin) and Heilungkiang (*qq.v.*). The total area thus included measured 463,320 sq.mi. In 1928 the province of Jehol was added, making a total of 502,000 sq.mi., and the region became known as the Four Northeastern provinces. Under the Japanese, the entire area later became the puppet state of Manchoukuo (Land of the Manchus). The Japanese eventually granted partial autonomy to the predominantly Mongol western areas. In 1947 the Chinese Communists incorporated these areas into the newly established Inner Mongolian autonomous region, and by 1954 the remaining area of 342,000 sq.mi. had been reconstituted as the Four Northeastern provinces, with three of the four truncated in the west. In 1956, after Jehol was divided among the Inner Mongolian autonomous region and Hopeh and Liaoning provinces, Manchuria once more was composed of three provinces, with an official total area of 309,498 sq.mi.—178,996 in Heilungkiang, 72,201 in Kirin and 58,301 in Liaoning. The western boundaries of the three prov-

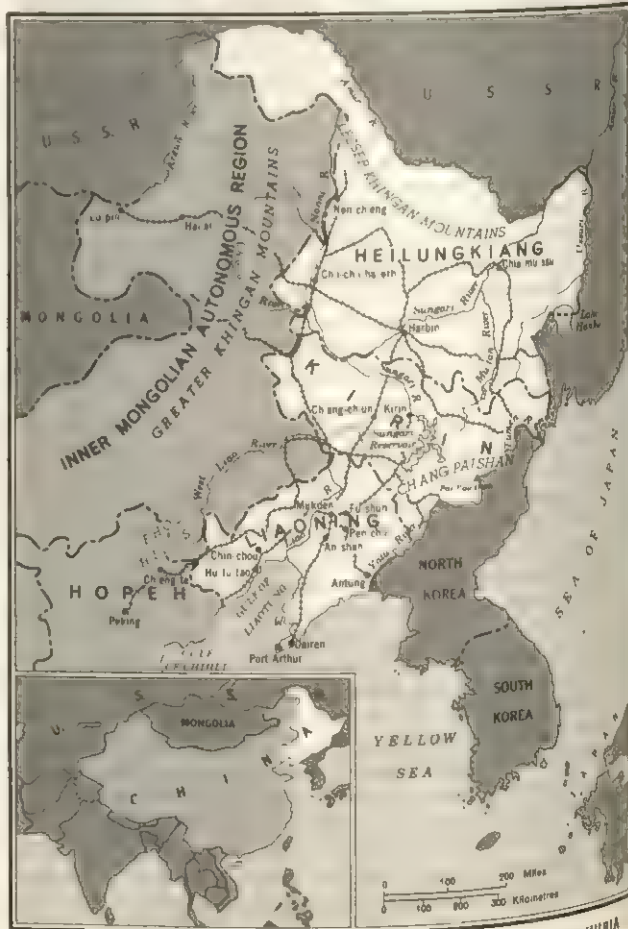

inces run roughly parallel to the north-south trending Khingan (Hsing-an-ling) mountains, except for an eastward salient (including Tung-liao) along the valley of the Hsi-liao (West Liao) river and a southwestern panhandle down to the Great Wall. In all the region extends through nearly 15 degrees of latitude, from approximately 38° 45' N. to 53° 30' N., or the equivalent of the distance between Washington, D.C., and Goose Bay, Labrador.

Manchuria is both an agricultural surplus producer and the most highly industrialized region of China. With a population estimated in 1961 at more than 53,000,000, about 7.5% of the national total, and the best regional transportation network in China, it continues to be the industrial but peripheral heartland of contemporary China, although other heavy industrial centres have been developed rapidly since 1952.

PHYSICAL GEOGRAPHY

Geographical Regions.—Manchuria may be divided into three subregions: the central lowland, the eastern highlands, and the western and northern highlands.

The Central Lowland.—Manchuria, as historically defined, forms a great quadrilateral, the heart of which is one of the great plains of China, the central Manchurian lowland. This plain is about 135,000 sq.mi. in area; all of it lies below 1,000 ft. elevation. It differs markedly from the north China plain, with which it often is compared, in that it is largely an erosional rather than a depositional plain. For this reason most of the surface of the plain is undulating rather than flat. Two major river systems drain the lowland—the Sungari (Sung-hua) and the Liao. The Sungari receives two major tributaries—the Nonni from the northwest and the Mu-tan from the south. The main stream rises in the eastern highlands of Manchuria and flows first northwest and then northeast through a broad floodplain to join the Amur. The Liao rises in the hills of Jehol as the West Liao and flows eastward and then southward to enter the Po Hai's northern arm, the Gulf of Liaotung. The 800-ft. divide between the two systems

MAJOR CITIES, RAILROADS AND PHYSICAL FEATURES OF MANCHURIA

occurs south of Ch'ang-ch'um, but is so little marked that it is scarcely discernible in the landscape. Most of Manchuria's hydro-electric potential is contained in the rivers of the Sungari system, together with the Yalu along the Korean border; the Liao, the drainage basin of which is largely semiarid, is much less significant, though it has built up a sizable alluvial plain along its lower course. Parts of the west Manchurian plain, moreover, are characterized by interior drainage with numerous ephemeral saline lakes and marshes.

The Eastern Highlands.—The central lowland is bounded on the east by the eastern Manchurian highlands which extend about 850 mi. in a northeasterly direction from the Liaotung peninsula almost to the junction of the Ussuri and Amur rivers. The most conspicuous range is the 5,000–9,000 ft. Ch'ang-pai shan (Long White mountains), of which the highest point is Pai-t'ou shan, containing the crater lake, T'ien Chih. The east Manchurian ranges are much higher in the south, where they provide a formidable barrier to communications between Manchuria and Korea, than in the north, where they dip toward the valley of the Amur and the lower Sungari rivers. These ranges are of complicated geological structure, with recent volcanic, igneous and metamorphosed rocks predominating; they are interspersed, however, with Paleozoic and more recent sedimentaries, many of which are carboniferous. The crystalline formations are highly metalliferous, and in them or at their margins are found a large proportion of Manchuria's metallic mineral wealth.

The Western and Northern Highlands.—West of the plain is the broken escarpment of the Greater Khingan mountains, now chiefly in the Inner Mongolian autonomous region, which extends from the broken hills of Jehol northward to the Amur. This range marks the boundary between the central lowland and the Mongolian plateau, which averages 4,000 ft. in elevation. Unlike the east Manchurian highlands, the Khingan are lower in the south than in the north, and in the vicinity of the West Liao river they decline to a series of low hills. Structurally, the Khingan mountains are the upturned edge of the Mongolian plateau, and they consist primarily of fairly recent sedimentary formations, some of which also are carboniferous. North of the plain and south of the Amur valley are the Lesser Khingan mountains, structurally related to the eastern highlands, which run southeastward for about 350 mi. from the northern Greater Khingan to the lower valley of the Sungari. The hills of Jehol, which bound the plain on the southwest, are an extension of the T'ai-hang shan of north China, though more complex in structure and with a higher proportion of igneous formations. They are characterized by high relief and denuded slopes, and resemble the highlands of Shantung province, themselves structurally related to the eastern Manchurian highlands. Between their eastern margins and the Gulf of Liaotung is the major entrance from north China into the central lowland, a narrow coastal plain which is crossed by the Great Wall at Lin-yü.

Climate.—Climatically, Manchuria reflects its northerly location on the eastern margins of Eurasia. Summers are hot and short; winters are long and severe. Winter temperatures decrease markedly from south to north; at Mukden, January mean temperatures are -13°C . (9°F .); at Harbin in northern Manchuria, they average about -16°C . (4°F .) The climatic analogue in North America for Harbin is Winnipeg, Man. In the north the rivers are frozen over until the end of April, and in the south until the beginning of April. Only the harbours at Dairen (Ta-lien), Port Arthur (Lü-shun) and Hu-lu-tao remain ice-free. On the plains the growing season is only 150–175 days; and in the highlands it is still shorter. The monsoon effect of eastern Asia is manifested in Manchuria's rainfall, which displays a marked summer concentration, with dry winters. At Ch'ang-ch'um three-fourths of an average year's rainfall occurs from June through September. Average annual rainfall on the plain is less than 25 in.; precipitation is greater in the east than in the semiarid west, where it may decline to 12 in. The rainiest areas are in the eastern mountains, where annual precipitation averages up to 40 in.

Vegetation and Soils.—The natural vegetation cover of most of Manchuria is grassland or mixed grassland and forest. In the

northeast, marshes and poorly drained meadowlands follow the course of the lower Sungari. In the west lies an open steppe which blends into the grasslands of Mongolia and thence into the steppes that cross most of Eurasia. The eastern slopes of the northern Khingans are forested, but the gentler western slopes are sparsely forested and in the south the forests disappear, although it is assumed that the Jehol highlands were forested at one time. The forests of the Lesser Khingans and the eastern Manchurian highlands provide China with its largest forest reserves. Korean pine is the chief commercial tree, and with other conifers, of which spruce, larch and fir are most important, it occupies the higher elevations. Hardwood forests of deciduous species, including oak, elm, poplar and birch, occupy the lower elevations. Exploitation of these forests over a long period of time has resulted in the decimation of those most accessible, and the largest remaining stands of virgin timber are in the least accessible highlands. Under the Communist government some replanting has taken place, although the chief reported effort has been in the planting of meridionally trending tree shelter belts from Ch'i-ch'i-ha-erh (Tsi-tsihar) southward to the Great Wall. (See GREAT WALL OF CHINA.)

The soils of the Manchurian plain are among the best in China. In the south the soils of the lower Liao basin, the area of earliest Chinese settlement, are predominantly alluvial. The bulk of the lowland soils, however, consist of residual grassland soils—deep, dark and fertile. Some of these are classified as “degraded” chernozems, and are in appearance and productivity similar to the black prairie soils of the North American corn belt. The soils of the western plain range from dark chestnut soils to the lighter saline soils characteristic of semiarid regions. Soils in the northern and higher eastern uplands are podzolics formed under forest vegetation. In the eastern highlands and Jehol the predominant soil type is the Shantung brown soil, formed in part from materials of loessial origin.

POPULATION AND SETTLEMENT

There have been Chinese in Manchuria from ancient times, possibly from as early as 1000 B.C. Immigration and communication with China apparently were primarily by sea. The Chinese originally were localized almost entirely in a triangular area in southern Manchuria, centring about the alluvial basin of the lower Liao river and the uplands of the Liaotung peninsula. This so-called “Chinese Pale” was bounded on three sides, other than the south, by a wall known as the Willow Palisade. An extension of this frontier, the so-called Outer Willow Palisade, ran northeastward from a point north of Mukden to the Sungari river north of Ch'ang-ch'um (*q.v.*). The southeastern portion of the Willow Palisade formed a frontier between Chinese and Koreans; the Outer Willow Palisade separated what was predominantly Manchu territory in the east from the Mongol-occupied steppes of west-central and western Manchuria. Within the Pale patterns of occupation resembled those that characterized the north China plain—a relatively dense agricultural population, living in compact villages, and oriented around rectangular walled cities connected with their restricted hinterlands by poor roads and canalized streams.

Much of Manchuria was held until modern times by non-Chinese Tungus peoples, whose racial affinities are more with the Mongols than with the Chinese. On at least three occasions these peoples gained control of southern Manchuria and moved into northern China as barbarian conquerors, recruiting manpower from their homeland beyond the Willow Palisade and from the Chinese whom they had conquered within the Pale. According to some authorities, the Tungus originally dwelt in northeastern China but were forced to retreat into Manchuria in the second millennium B.C. by the Chinese advancing from the loess area of northwestern China. The tide of Chinese colonization then swung south into the Yangtze valley, and, while the northern branches of the Tungus spread into the northern forest, the southern groups remained in Manchuria. The Tungus of the forest retained their old hunting, nomadic life, but those of the central and southern plains in time acquired the arts of cultivation from their Chinese neighbours.

Although excellent horsemen, as befitted dwellers on the steppe, the Tungus of the plain, as evidenced by the Manchus, were ignorant of the art of milking and were essentially not pastoral nomads. On the other hand, the Mongols were true steppe nomads. They came to occupy most of western Manchuria after the upsurge of Mongol power which culminated in the late 13th century in the Yüan dynasty's rule over China, and until well into the 19th century they continued to control the grasslands of the central lowland eastward to Ch'ang-ch'un and nearly as far as Mukden itself.

The immigration of Chinese into Manchuria was long forbidden, but after 1776 this prohibition was relaxed in the case of Liaoning, the southern province, and in the third quarter of the 19th century the Manchus had to recognize colonization in Kirin (Chi-lin). The dense agricultural population of north China was beginning to spill over the border in considerable numbers into vacant lands whose settlement, always sparse, had been further depleted by recruitment for the Manchu garrisons in China. By the end of the 19th century the population of Manchuria, exclusive of Jehol province, is estimated to have been 14,000,000, of which 80% were Chinese. In comparison with what was to follow, however, this movement was no more than an infiltration and consisted mainly of males who intermixed with the Manchus and in time absorbed them. Pure Manchu groups remain only in northern Manchuria, chiefly in the Ai-hun (Aigun) district, and these are the descendants of soldier-colonists planted by the early Manchu emperors in the Amur valley. According to the national population registration of 1953, approximately 2,400,000 persons in all China were listed as Manchus, most of whom presumably lived in Manchuria. (See also MANCHUS.)

The rapid economic development of south Manchuria under Japanese auspices after 1905 set in motion a mass migration. Coming mainly from Hopeh and Shantung, the most densely populated provinces of north China, from 300,000 to 400,000 agricultural labourers annually migrated to Manchuria, but of these half or two-thirds returned each year to China after the Manchurian harvest. In the 1920s this seasonal migration was accompanied by a permanent migration of families, and in 1927 net immigration reached a peak of 843,000. North Chinese farmers penetrated inland along the rapidly expanding railway systems in the north and west as well as the south.

By 1940 the total population of Manchuria as then constituted, including the former Kwantung leased territory and areas later transferred to the Inner Mongolian autonomous region, had reached 44,570,000. Of this total about 90% were ethnically Chinese, despite Japanese restrictions on Chinese immigration prior to 1938. At that time the Japanese, exclusive of troops, numbered about 1,000,000, settled almost entirely in cities in spite of Japanese attempts to encourage agricultural settlement. Mongols numbered about 2,000,000. Koreans totaled an estimated 3,000,000, concentrated chiefly in the southeastern Chien-tao region, an area long settled by Koreans and in which the Japanese officially encouraged Korean settlement after 1932. Many of these Koreans later became supporters of the Chinese Communists during the Chinese civil war and ultimately formed the trained core of the North Korean armies. When adjusted to 1961 boundaries, the 1940 population of Manchuria was about 38,000,000, exclusive of Japanese.

By 1957 the registered population of Manchuria within the 1961 boundaries had increased to 51,500,000, of which 47% was in Liaoning, 29% in Heilungkiang and 24% in Kirin. The rate of population increase had been considerably more rapid between 1940 and 1957 in Liaoning and Heilungkiang than in Kirin, possibly reflecting the expansion of agriculture and the development of new industries in northern Manchuria, and the expansion of a long-established industrial belt in the south. Population is most heavily concentrated in the central lowland, and chiefly in the southern part of it. The population density for the region in 1957 was 166 per square mile, considerably lower than in the rest of agricultural China. Densities were highest in Liaoning, with 413 per square mile; in Kirin they were 174 per square mile and in Heilungkiang, 83. With an estimated population of about 53,000,000 in 1961, the population density rose to 171 per square mile,

although large areas continued to have densities of less than 25 per square mile.

Coincidental with the enormous increase in population was a rapid urbanization which caused Manchuria to become the most highly urbanized region in China. It is estimated that 30% of its population may be classified as "urban," as compared with about 13% for China as a whole. About 17% of the urban population of China is believed to reside in Manchurian cities. As compared with most cities in China, the larger Manchurian cities, with the notable exception of Mukden, are relatively modern creations. Officially, there are 24 municipalities, among which the 7 largest (with their estimated 1957 populations) are: Mukden (2,411,000), Lü-ta (Port Arthur-Dairen; 1,508,000), Harbin (1,552,000), Fushun (985,000), Ch'ang-ch'un (975,000), An-shan (805,000) and Pen-ch'i (1953) (449,000). With the exception of Harbin, the larger cities are in the southern half of the region, and these grew most rapidly during the Japanese period and the early part of the Communist period. However, there is evidence that cities in Heilungkiang, including Harbin, are growing at a more rapid rate as the economic development of the northern areas proceeds. Birth rates appear to be high in the largest cities (about 40-45 per 1,000), whereas death rates are low (7-10 per 1,000). Thus, since migration to Manchurian cities continues at a rapid rate and the rate of natural increase is high, both the absolute and relative growth potentials of Manchuria's cities are very large.

Illiteracy among the Manchurian population was high during the period of Japanese domination, and in the mid-1950s it still was estimated at 78%. However, by 1961 it was claimed that more than 90% of the school-age children in the region were receiving primary education and that illiteracy had been greatly reduced. Special attention was being given to technical education. Higher education was concentrated in colleges and universities at Mukden, Ch'ang-ch'un, Harbin and Lü-ta.

HISTORY

Until 1900 Manchuria remained in large part foreign to China. From earliest times Manchuria, except for the lower alluvial basin of the Liao river, had been sparsely populated by non-Chinese peoples. To the Chinese it was, historically, the easternmost part of the vast territory beyond the Great Wall within which lived nomadic barbarians who from time to time left their predominantly grassland "reservoir" region to invade China itself. Manchuria was an especially important part of the great "reservoir." From it the Liao (Khitan) dynasty extended its control over the north China plain in the 10th century; from it also the Jurchen (Chin) in the 12th century extended their control over China south to the Yangtze river. Later the Mongols spread over the region and descended upon China in the 13th century to form the Yüan dynasty. Finally the Manchus, a Tungus tribal group originally from eastern Manchuria, crossed the Great Wall and established the Ch'ing dynasty in the middle of the 17th century. Between these periods, Chinese control extended over much of the outlands, but most of Manchuria remained a preserve of the Manchus and their Mongol allies until very recent times. It was not until the latter half of the 19th century, when Chinese immigration into Manchuria began to increase rapidly, that Manchuria became "Chinese."

In the closing decades of the 19th century foreign powers began to eye the region as a fruitful field for imperialist expansion. For tsarist Russia, Manchuria was to be an eastern outpost and terminus of the Trans-Siberian railway which was to bind that empire together. Japan, with an apparently overflowing population and only limited resources, had a more vital interest than Russia in Manchuria. As a relatively undeveloped but potentially productive country, Manchuria promised to the Japanese not only an exportable surplus of both foodstuffs and industrial raw materials but also a field for colonization.

Russo-Japanese Conflict.—The conflict between Russia and Japan for the control of Manchuria first raged over the possession of the Liaotung peninsula, which is not only the southern gateway into Manchuria but commands the seaward approaches to Peking. The first move was taken by Japan. As the prize of its victory in the Chinese-Japanese War of 1894-95, Japan demanded the ces-

sion of the Liaotung peninsula from the mouth of the Yalu to the mouth of the Liao. But Russia, backed by France and Germany, forced Japan to abandon this claim. Then by means of intrigue and a show of force Russia acquired (1898) the lease for 25 years of the territory of Kwantung at the very tip of the peninsula, containing the naval station-to-be of Port Arthur and what has since become the great commercial entrepôt of Dairen. Japan returned to the attack and by the treaty of Portsmouth (1905), which registered its victory over Russia in the war of 1904-05, obtained the transfer of the Kwantung lease. Meanwhile Russia had been pushing forward its scheme of railway construction. It had already built the Chinese Eastern railway (C.E.R.) across northern Manchuria to Vladivostok and had completed construction of a branch from it through southern Manchuria to Port Arthur. Russia also had established an ethnically Russian centre of settlement, Harbin, on the banks of the Sungari river. By the treaty of Portsmouth Japan became heir not only to the lease of Kwantung but also to the Russian-built railway from Ch'ang-ch'un to Port Arthur. In 1906 it and the rights pertaining to it were vested in the semigovernmental South Manchurian Railway company (S.M.R.). Russian interests were thus pushed back into Manchuria north of Ch'ang-ch'un, into the provinces of Kirin and Heilungkiang. The properties of the C.E.R. and S.M.R. were held on leases, the S.M.R. on one of 99 years and the C.E.R. on one of 80 years. China had the option of purchasing the latter after 36 years. Investment in the S.M.R. was limited to Chinese and Japanese subjects and in the C.E.R. to Chinese and Russian; in effect the paramount interests were Japanese and Russian.

1915-1930.—By possession of the arterial railway through south Manchuria and of its seaward terminus in Dairen, Japan held the chief key to the economic penetration of south Manchuria. The famous 21 demands presented to China in 1915 affirmed "the predominant position of Japan in South Manchuria and Eastern (Inner) Mongolia." During the Chinese civil war Japan continued to exercise a controlling influence in south Manchuria with the support of the Kwantung army, organized in 1919 and destined to become Japan's most powerful military force on the Asian continent. As a result there had come to exist in effect an unstable condominium among Japanese, Russian and Chinese interests.

For a few years it appeared that the first power to be eliminated would be Russia. The Russian revolution of 1917 was followed by the breakdown of orderly Russian administration in the far east. The situation was complicated by the dispatch of troops to eastern Siberia by Great Britain, France, Japan, the United States and China. In numbers of troops Japan outdistanced the others, and for a time it appeared that Japan might supplant Russia in that region. Partly to prevent this development, the C.E.R. was placed under the control of an Allied commission with an American at its head. In 1919, after the Communists had gained control in Russia, they announced their renunciation of all special privileges acquired by the tsarist government in China. In the actual negotiations with China, however, by an agreement signed May 31, 1924, the Soviet Union, while surrendering extraterritoriality and the former Russian concessions and agreeing in principle to the eventual repurchase by China of the road, insisted upon retaining a share in the administration of the C.E.R. A somewhat similar agreement regarding the C.E.R. was signed between the U.S.S.R. and Chang Tso-lin, the ruler of Manchuria, Sept. 20, 1924. Friction followed, accentuated by the anti-Communist, anti-Soviet reaction in China after 1927. In 1929, under Chang Hsueh-liang, the youthful successor of Chang Tso-lin, and impelled by the rising tide of nationalism, the Chinese attempted to oust the Soviet Union from its participation in the C.E.R. The U.S.S.R. struck back, and in a sharp, brief, undeclared war the *status quo* was restored.

The Japanese Period.—Not the U.S.S.R. but China was the first of the three powers to be eliminated from Manchuria, as mounting Chinese nationalism clashed with Japanese militarism. In various ways the Chinese attempted to restrict the Japanese. Friction, too, developed between Koreans and Chinese in Manchuria, the former being Japanese subjects. On the night of Sept.

18-19, 1931, the Japanese military forces struck, giving as the reason an allegedly Chinese bomb explosion on the South Manchurian railway near Mukden. In the following few weeks they occupied a number of strategic centres. At the time Chang Hsueh-liang had most of his forces south of the Great Wall, and before the Japanese army his rule in Manchuria quickly collapsed. China appealed to the League of Nations. That body appointed a commission, headed by the earl of Lytton, which, after investigation, issued a report generally unfavourable to the Japanese, in the autumn of 1932. The League proved unable to implement its decision, but its action led to Japan's withdrawal from League membership.

In the meantime the Japanese were erecting a new administration. Local and provincial provisional governments were established mostly by resident Chinese (and, in some areas, Mongols) with Japanese advisers. Early in 1932 a Manchuria-wide government was organized, and on Feb. 18 of that year it declared the independence of the three eastern provinces under the name of Manchoukuo (the state of Manchu). To provide an air of legitimacy P'u-i, who with the title of Hsüan-t'ung had been the emperor of the Manchu dynasty when it abdicated its control of China in 1912 and who had since been living in retirement in Peking and Tientsin, became "chief executive." A step further was taken when, on March 1, 1934, P'u-i formally announced his ascent to the throne of newly named Manchoutikuo (the empire of Manchu) under the title of K'ang-te. His residence was established at Ch'ang-ch'un, renamed Hsin-ching, or Hsinking (the New Capital), where an extensive building program produced an impressive physical emblem of the new state. No attempt was made by the Japanese, however, to restore the Ch'ing dynasty throughout all China by linking the new state with the puppet regime of Wang Ching-wei in north China. The government of Manchoutikuo throughout its life was Japanese-controlled. The most important agency in the government was the so-called general affairs board, a kind of executive secretariat, the director-general of which was from the first a Japanese. Practical military control was exercised by the Kwantung army. Internationally, the new country was recognized only by Japan, Germany and Italy (its Axis partners) and El Salvador, although in the Soviet-Japanese treaty of 1941 the U.S.S.R. granted partial recognition. Soviet official interests were practically eliminated by the sale of the C.E.R. to the Hsin-ching government in 1935. However, the Soviet Union's continuing concern with the region was indicated by a series of border skirmishes between Soviet troops and military units (including Japanese) of the new government, which took place in 1937, 1938 and 1939, the last at No-men-k'an (Nomonhan).

After World War II.—On Aug. 9, 1945, after the Soviet Union's declaration of war against Japan, Soviet and Outer Mongolian troops invaded Manchuria from all directions except the south. Fighting was sharp and brief. The Japanese capitulated on Aug. 14, and within two weeks Soviet troops had occupied all the chief cities. Under the Yalta agreement the U.S.S.R. was granted use (with China) and practical control of the naval base at Port Arthur; Dairen was internationalized, although the harbour master was to be a Soviet national; and the C.E.R. and S.M.R. main lines, under the name of the Chinese Ch'ang-ch'un railway, were to be placed under joint Sino-Soviet control for a period of 30 years. These conditions were verified in the treaty between China and the U.S.S.R. of Aug. 14, 1945. As a result the U.S.S.R. regained essentially the same rights and privileges, other than extraterritoriality, which tsarist Russia had held in 1904. By the end of April 1946, however, the U.S.S.R. had evacuated its troops from almost all of Manchuria, though not before a systematic looting of Manchurian industrial equipment as war booty had taken place.

Meanwhile, Chinese Communist troops had begun to enter Manchuria in large numbers as "civilians" under orders from Communist leader Chu Teh and with the tacit consent of the Soviets. After the withdrawal of the Soviet troops, the Chinese Communists, allied with anti-Japanese Chinese and Korean guerrillas and with the later assistance of the Mongols of Manchuria, gained control of and politically organized all of northern Manchuria and

much of the countryside in the south. They armed themselves with captured Japanese military equipment, again with Soviet tacit consent. Nationalist troops landed at Ch'in-huang-tao in Nov. 1945, since Dairen was closed to them by the Soviets and other ports were in Chinese Communist hands, and marched northward along the Peking-Mukden railway. By May 1946 they had gained control of Ch'ang-ch'un, the former capital. The Nationalist and Communist armies fought over central Manchuria until Mukden fell to the Communists on Oct. 30, 1948; shortly thereafter the entire region passed into Chinese Communist hands.

Manchuria thus became the first major region of China to come wholly under Communist domination. On Aug. 27, 1949, the Northeast People's government was established at Mukden under Kao Kang, and Manchuria became the first of the six large administrative regions of China. On June 21, 1954, the major administrative regions were abolished in China, because of tendencies toward regional independence from Peking. Kao Kang was purged, and the powers of the Northeast People's government reverted to Peking, to the three reconstituted truncated provinces of Heilungkiang, Kirin and Liaoning, and to the Inner Mongolian autonomous region (originally established in May 1947). For a time Soviet influence remained strong in the region, but on Dec. 31, 1952, the Soviet Union transferred its rights in the Chinese Ch'ang-ch'un railway to the Chinese, and on May 24, 1955, the U.S.S.R. signed an agreement for the evacuation of troops and the transfer to China of all installations at Port Arthur without compensation. By June 1 the transfer was reported completed.

During the Korean War (1950-53) Manchuria was an important staging area for Chinese troops, which entered the war in Oct. 1950. Even prior to the war, Manchuria was a major supply base of the North Korean army both for personnel, from among the Korean population of the region, and matériel. Communications were facilitated by the three railway connections between Manchuria and North Korea.

ADMINISTRATION

Manchuria has been administered as a regional unit through most of its modern history, though after 1954 this was no longer the case. Under the Manchus it was formally separated from China south of the Great Wall as a Manchu reserve, despite the large Chinese population in the south and increasing Chinese immigration late in the 19th century. During most of the Republican period (1912-32) it was divided into three provinces—Liaoning (or Feng-t'ien), Kirin (or Chi-lin) and Heilungkiang, but until the Japanese period of domination after 1932, it was administered primarily as a single region under the war lord regimes of Chang Tso-lin and his son Chang Hsüeh-liang. During the Japanese period, Manchoukuo (or Manchoutikuo) consisted of 19 provinces, the boundaries of which followed earlier local administrative boundaries wherever possible. These provinces were Kirin, Lung-chiang, Hei-ho, San-chiang, Pin-chiang, Chien-tao, Su-ping, Antung, Liaoning, Chin-chou, Jehol, Mu-tan-chiang, T'ung-hua, Pei-an, Tung-an, West Hsing-an, South Hsing-an, East Hsing-an and North Hsing-an and one independent municipality Hsin-ching (Ch'ang-ch'un), the capital. The Japanese, however, granted partial autonomy to the heavily Mongol-populated Hsing-an provinces. After the end of World War II Manchuria was to have been divided into ten provinces by the Nationalist government: Liaoning, Liao-pei, Antung, Kirin, Sung-chiang, Ho-chiang, Heilungkiang, Nun-chiang, Hsing-an and Jehol; but this administrative division never was implemented.

On May 1, 1947, the Chinese Communists, who controlled most of Manchuria at that time, established the so-called Inner Mongolian autonomous region and included within it the western Hsing-an areas. The remainder of the region was divided among six provinces, again using previously established boundaries: Jehol, Liao-hsi, Liaotung, Kirin, Sung-chiang and Heilungkiang. In Aug. 1949 the Northeast became the first of the six so-called "large administrative regions" in China (*ta-hsing-cheng-ch'ü*). On June 19, 1954, the large administrative regions in China, including that of the Northeast, were abolished; the six provinces were reduced to four, Jehol, Liaoning, Kirin and Heilungkiang, and Man-

churia ceased to exist as a formal regional unit. On Jan. 1, 1956 Jehol was abolished as a province, and 5 of its 16 *hsien* (counties) and 3 banners were transferred to Liaoning province, the remainder going to Hopeh province and the Inner Mongolian autonomous region. At the same time, five cities which had been defined as special municipalities at the provincial level were reduced to subprovincial rank, Mukden (Shen-yang), Fushun, Anshan, Pen-ch'i (Penki) (*qq.v.*), and Lü-ta (the twin cities of Port Arthur and Dairen), and several *hsien* were transferred from Liaoning to Kirin.

Thus, Manchuria consists of the three provinces, Liaoning, Kirin and Heilungkiang. At the subprovincial level, Liaoning is composed of five special districts (*chuan-ch'ü*). The special districts are divided into 42 counties (*hsien*); 2 autonomous counties (*tsu-chih-hsien*), the Fou-hsin Mongol autonomous *hsien* and the K'o-la-chin-tso-i Mongol autonomous *hsien*; and 11 municipalities (*shih*). Kirin province is divided into three special districts and one autonomous *chou*, the Yien-pien Korean autonomous *chou*. These in turn are subdivided into 41 counties; 2 autonomous counties, the Ch'ang-pai Korean autonomous *hsien* and the Ch'ien-kuo-erh-lo-ssu Mongol autonomous *hsien*; and 5 municipalities. Heilungkiang province is divided into five special districts. These are subdivided into 58 counties; 1 autonomous county, the Tu-erh-po-t'e Mongol autonomous *hsien*; and 8 municipalities. Most of the administrative municipalities in all provinces include not only the central city, but also a considerable nonurbanized hinterland.

At the subcounty level, the basic unit of administration has long been the township (*hsiang*) and the town (*chen*), but in 1958 a new unit of political and economic organization was established: the commune (*jen-min kung-she*), the area of which is most commonly coterminous with the *hsiang* or in some cases the *hsien*. The communes combine both administrative and economic functions, and thereby represent an attempt to better organize production and control political thought and activity. In the municipalities the administrative subdivision has been into wards (*ch'ü*), but urban communes also have been established in most cities to replace these.

Each of the three Manchurian provinces is governed by a provincial government elected by a provincial people's congress, which is composed of delegates elected by the county people's congresses. These, in turn, are elected by the township or commune people's congresses. Senior officials at the provincial level, however, are in fact appointed by the central government at Peking.

ECONOMY

Transportation.—Since 1900 Manchuria has witnessed a remarkable growth of population, agriculture and manufacturing. The framework about which this development has taken place is the railway system, virtually nonexistent at the turn of the century. The railways of Manchuria amount to more than 8,000 mi., about 42% of all the rail mileage in China. The main lines of the system are T-shaped and are the oldest in the region, having been completed by the Russians in 1904. The head of the "T" (the former main line of the so-called Chinese Eastern railway) runs from the northwestern border town of Lu-pin (Man-chou-li) southeastward through the rail junction at Harbin, a by-product of Russian railway construction, to the Soviet border at Su-fen-ho, forming a chord across the Trans-Siberian railway's arc which follows the outer bend of the Amur river. Connections are made with the Trans-Siberian railway in Soviet territory at both ends of this line, and Vladivostok is its natural Pacific terminus. The base of the "T" runs from Harbin to Port Arthur. As of 1908, these key lines already had been supplemented by a connection from Peking to Mukden and a line built by the Japanese from Mukden to the Korean border at Antung. Railway expansion was rapid thereafter. The Chinese, with the Japanese anomalously supplying the capital, proceeded to build competitive railways parallel to the South Manchurian system in the south and cutting across the Chinese Eastern railway in the north, with connections leading into the central lowland. Chinese penetration into the Mongol country of the west and northwest over

these lines aroused Japanese fears of Chinese control over what had come to be regarded as an area of Japanese special interest. These fears were accentuated by Chinese development of the port of Hu-lu-tao, on the western shores of the Gulf of Liaotung, which was described by the Chinese as a potential rival to Japanese-held Dairen. They culminated in Japan's occupation of Manchuria in 1932.

From the basic network of 3,500 mi. of railways in 1932, the Japanese built an elaborate railway system which, together with the North Korean railway system, was run by the South Manchurian railway company. This company maintained an entirely self-sufficient rail network, producing its own coal and for a time steel, and manufacturing and repairing cars and equipment at shops near Dairen and in Mukden. In March 1935 the former C.E.R. was sold by the U.S.S.R. to Manchoutikuo. Within months its wide gauge had been narrowed to the standard gauge of all the major Manchurian lines, and branch lines were thrust out to the frontiers. A second connection was completed to Peking through southern Jehol province. Two major connections, in addition to that at Antung, were made with the North Korean railways. The most important of these was the eastward extension of the Ch'ang-ch'un-Kirin-Tun-hua line to Tumen at the Korean border and thence to three ports in northeastern Korea fronting on the Sea of Japan—Unggi, Najin and Ch'ongjin. This new railway provided a direct outlet for the produce of the central and northern Manchurian plain to the Sea of Japan, which was approximately 450 mi. closer to Japanese ports than Dairen. Other lines were pushed toward the Amur, some of them of relatively light construction, and all of them of strategic importance.

Manchuria's railways are single-tracked except for the Harbin-Lü-ta, Mukden-Antung and Mukden-Peking routes. Under the Peking regime, little railway construction has taken place in Manchuria. Until 1955 the Manchurian system provided the chief overland connections between China and the Soviet Union, but the completion of the Trans-Mongolian railway in that year provided a new connection which shortened the route between Moscow and Peking by 710 mi.

River and road traffic clearly has been secondary to the railways. Most of the 13,000 mi. of roads in Manchuria are unsurfaced, except for those connecting the largest cities. River traffic is restricted primarily to the Sungari and its lower tributaries, along which specially constructed river boats similar to the Mississippi river side- and stern-wheelers move for about seven months of the year until the rivers freeze in late fall. The rivers of southern Manchuria, though open somewhat longer, are shallow and little used above their lowest courses except by Chinese country boats. Plans exist to construct a series of canals which will connect the Sungari and Liao river systems with each other and An-shan with the lower Liao.

Agriculture.—The rapid expansion of the railways was accompanied by an equally rapid expansion of agricultural settlement, although not by an equally large increase in agricultural production. Between 1919 and 1930, when the amount of cultivated land reached an estimated 33,000,000 ac., the total area under cultivation doubled. By 1940 cultivated land amounted to about 44,000,000 ac., and total food crop production to about 19,000,000 metric tons. Since 1940 the acreage of cultivated land apparently has increased only slightly. It appears that the best agricultural lands in Manchuria, with few exceptions, were already occupied by 1940; those that remain are of poorer quality and present problems of drought, flood, poor soils or a short growing season. Land utilization, nevertheless, differs markedly from region to region. Whereas in the south up to 95% of the arable land has been put to use, in the north considerably less than 50% has been utilized. In the north, also, farm units traditionally have been relatively large, nearly half the farms being over 17 ac., whereas in the south about 60% of them are estimated to have been 10 ac. or less; even this size is large, however, as compared with the north China plain, where the average farm unit averaged about 5 ac. in size prior to communization.

Crop combinations in lowland Manchuria are similar to those in the north China plain, which it resembles climatically and cul-

turally. Most of the crop acreage is devoted to drought-resistant cereals and soybeans. Kaoliang, a grain sorghum, is the most important cereal and occupies perhaps 25% of the total cropped acreage. It is cultivated chiefly in the southern portion of the central lowland. Small millets are almost equally important, and these also are concentrated in the south. In the north, soybeans are the most important crop, but they are widely grown and account also for about one-fourth of the total cropped acreage. Manchuria produces about 40% of China's total soybean production. Spring wheat, nearly one-third of China's acreage, also is a major northern crop; corn is concentrated in the southeast, chiefly in areas of Korean settlement; rice also is important, occupying about 1,000,000 ac., chiefly in southern Manchuria and the eastern uplands, although it is becoming increasingly important in the north as well. Other grains, such as barley and oats, also occupy significant acreages. Cotton is an important crop in the south, and flax and sugar beets are major crops in Heilungkiang. Lesser crops include oilseeds, tobacco, peanuts and hemp. Some crop rotation is practised, with grains alternating with legumes. The relatively short growing season of about 150 days in the central lowlands permits little double-cropping, and irrigated agriculture is restricted primarily to the rice-growing acreages. In general, yields are lower in Manchuria than in the north China plain, and efforts have been intensified, especially since 1957, to increase yields by more intensive cultivation practices, including deeper plowing, a greater use of fertilizers, drainage and water control, and the introduction of seed with a higher yield. Animal husbandry is subsidiary to crop production, as is the case in most of China, but the herding of sheep and goats is important in the dry western plains near the border with Inner Mongolia.

Manchuria has long been a surplus food producer in spite of its rapid growth in population. During the period of the Japanese occupation, agricultural products accounted for more than 60% of Manchuria's exports, chiefly in the form of soybeans and soybean products. Large quantities of millet also were exported to Korea to replace more valuable Korean rice, which then provided Japan with two-thirds of its rice imports. World War II disrupted agriculture, and it was not until 1952 that Manchurian food production reached its 1940-45 levels. In 1961 production may have reached 25,000,000 tons. An estimated 2,000,000 tons of foodstuffs are sent to other parts of China annually. In addition, soybeans, chiefly from Heilungkiang, are exported in large quantities to the U.S.S.R.

Agriculture in Manchuria was collectivized more rapidly than in any other part of China, primarily because the Communists controlled the region for a longer period of time. The commune system is the predominant form of agricultural organization. Manchuria also contains most of the large-scale state farms in China, of which about 100 are reported to be highly mechanized. Many of these had their origins in large reclamation colonies for Japanese soldiers and their families which were located in previously unsettled areas in the lower Sungari basin. Nevertheless, agricultural expansion apparently has been less rapid than had been anticipated, partly because of floods and other natural disasters in 1960 and 1961, though as early as 1959 several key Communist party officials were removed from their provincial posts as an indication of the central government's displeasure at the relatively slow progress in the agricultural sector.

Mining.—Although Manchuria has become the most important industrial region of China and its industries are based largely upon its own mineral resources, these resources are in general inferior to those of other parts of China. However, they have been relatively accessible, as compared with many other mineral deposits in China, and a number of them are conveniently located within a small area in the southern part of the region. Nevertheless, the relative importance of these resources is declining, as other discoveries are made elsewhere in China and new mineral deposits are being exploited.

The chief Manchurian mineral resource is coal. Reserves are estimated at about 20,000,000,000 tons, comparable in size to those of Japan but only a small fraction of China's total reserves, which are estimated at 1,000,000,000,000 tons. The chief Man-

POWER PLANT AT FUSHUN, MANCHURIA, LARGE COAL MINING AREA. WORKERS' HOUSES ARE IN THE FOREGROUND

Manchurian deposits are along the eastern and southwestern margins of the central lowland. The largest deposits are at Fushun, about 20 mi. E. of Mukden, where the coal measures are up to 400 ft. in thickness. Where the deposits reach the surface, opencast mining is practised in one of the largest open pits in the world. Other major deposits are exploited at Fou-hsin and Pei-p'iao in eastern Jehol, Pen-ch'i southeast of Mukden, Yen-t'ai south of Mukden, Liao-yüan (Hsi-an) east of Ssu-p'ing-chieh, Sui-tung (Hao-kang) in northeastern Manchuria, and in the Tung-pien-tao region in the east Manchurian highlands near the Korean border. Most of the Manchurian coals are noncoking bituminous, but good coking coals are found at Pen-ch'i, Pei-p'iao, Sui-tung and Tung-pien-tao. Production is estimated to be considerably above the peak pre-Communist total of 26,000,000 metric tons in 1943. The Fushun fields are associated with vast beds of oil shale (estimated at 7,628,000,000 metric tons) containing 3% to 7% petroleum. Production of more than 16,000,000 metric tons of shale in 1959 is reported to have yielded 1,000,000 tons of oil, or about one-third of China's oil production in that year. Large shale deposits also have been reported in Heilungkiang. Little liquid petroleum is known to exist in Manchuria, although there are favourable geological formations in the northwest near Dalainor.

Iron ore reserves are modest in terms of the needs for modern industry, but they account for at least half of all China's known reserves. The most reliable estimates of both measured and inferred reserves are 1,840,000,000 metric tons, of which only 115,000,000 tons are high-grade ores. The remainder are low-grade ores containing from 25% to 40% iron. The Manchurian ores also contain up to 40% silica and demand costly beneficiation. The major exploited deposits, in close areal association with coal deposits, are near An-shan about 60 mi. S.W. of Mukden, at Miao-erh-kou south of Pen-ch'i, and in the Tung-pien-tao region. In the first two cases, the ores are low-grade magnetites and hematites, with small deposits of higher-grade ores; at Tung-pien-tao the ores are hematites averaging 60% iron. In spite of their modest size, the Manchurian iron ores have become the basis for the largest iron and steel industry on the mainland of Asia. In large part this is a reflection of the localization of iron ore, coal and limestone within a few miles of each other in south-central Manchuria. Numerous other metallic minerals, including molybdenum, manganese, pyrites, copper, zinc and lead are mined in Manchuria; of these molybdenum and lead are important exports. Gold has long been an important product, particularly in the eastern and northern highlands. Huge deposits of magnesite are found east of Ying-k'ou in southern Manchuria, and alumina shales are mined south of Mukden. Limestone, talc, clays and mica

are among the more important nonmetallic minerals. Salt is obtained from sea water along the coasts of the Liaotung peninsula.

Industry.—Manchuria continues to be the industrial heartland of China, despite the growth of major industrial areas elsewhere. Before 1932 Manchurian industry was small in size and highly localized in the Kwantung leased (to Japan) territory and along the main-line railways where the railway companies had developed collieries and manufacturing industries in addition to railway service facilities. After 1932 Japanese industrialization plans were implemented primarily under the direction of a congeries of semigovernmental corporations, including the South Manchurian railway. Estimates for 1943 indicate that under a war economy pig iron production, chiefly at An-shan and Pen-ch'i, rose to 2,000,000 tons and steel ingot production to more than 1,000,000 tons, with An-shan the only integrated iron and steel plant in the region. Although the iron and steel industry was large for Asia, it was small by American and European standards.

In association with the iron and steel industry a series of secondary manufactures were developed. Mukden, the centre of the heavy industry region, also was a centre for the machine tool and munitions industries. Dairen and Port Arthur formed a second industrial zone, with shipyards, railroad locomotive and car factories, and chemical, machinery and textile plants. At Harbin, light industries based in part upon processing of such agricultural produce as flax, soybeans, wheat and sugar beets were developed. Ch'ang-ch'un, Kirin, Chin-chou and Antung each possessed industrial establishments of size, all except Chin-chou dependent upon hydroelectric power from the great dams on the Sungari and Yalu rivers. The first of these dams was completed in 1941 at Sui-fong, 40 mi. up the Yalu from Antung, and is one of the largest in the world, being 525 ft. high and 2,800 ft. long. A second great dam and power plant was completed at Ta-feng-man (Feng-man), on the Sungari river about 15 mi. S.E. of Kirin city, to supply power for much of central and northern Manchuria. The total installed capacity of both hydroelectric and thermal power facilities in Manchuria in 1944 was estimated at 1,790,000 kw. as compared with 1,350,000 kw. in all of China proper. In addition, the oil shales associated with the coal measures of southern Manchuria were processed for oil extraction at a plant in Fushun which produced up to 300,000 tons per year, and coal distillation also was used to produce oil. Tied in with the expanding electrical generation program were new metallurgical and chemical industries. Local high-alumina shales and clays were used after 1938 to produce alumina and aluminum, and the rich deposits of magnesite near Ta-shih-ch'iao also were utilized. Chemical by-products of the iron and steel and oil shale extraction industries, such as ammonium sulfate fertilizer and carbon black, were produced at Fushun, An-shan and Pen-ch'i; ammonium sulfate plants were constructed at Dairen and Hu-lu-tao; and several plants producing soda ash and caustic soda were constructed. To satisfy labour requirements for the expanding industrial complex, the Japanese lifted restrictions on the immigration of north Chinese, allowing 595,000 to enter in the peak year of 1939; almost all of these entered the industrial rather than the agricultural labour market. For the most part, the industrial complex was developed as a potentially independent and substantially self-sufficient economic entity. Most of the manufactured products of Manchuria remained there; only a modest proportion was exported to Japan, and this represented only a fraction of the value of Manchurian agricultural exports to Japan. In fact, so much Japanese capital flowed into Manchuria that there is reason to believe that the region may well have been a drain upon, rather than an asset to, the Japanese economy.

As a result of World War II and the Chinese civil war, Manchurian industry suffered heavily. Soviet selective removals of machinery had an estimated replacement value of \$2,000,000,000. Additional damage from civil war destruction, looting and neglect was enormous. By the time the Chinese Communists took over the Manchurian industrial complex had substantially deteriorated. By 1952, however, considerable progress had been made in reconstructing the Japanese industrial complex, and by 1955 earlier peak loads of production for most industries had been equaled or

exceeded. Most of the 141 major industrial projects at the core of China's 1953-57 economic plan were located there; most were dependent upon technical assistance from the Soviet Union; and many represented rehabilitation and expansion of Japanese-founded installations.

In general, Manchurian industry continued to display the same basic locational characteristics that it did in the pre-Communist period, but it was characterized by an increasing diversification of products and some dispersion outside of the heavy-industry core-zone focusing on An-shan and Mukden. After the middle 1950s, established industries were further enlarged, and new ones established. The steel plant at An-shan and the Pen-ch'i iron and steel complex were expanded. Production in the oil shale refinery at Fushun was increased to 1,000,000 tons of oil annually, and the alumina-aluminum plant there achieved a capacity of about 100,000 tons of aluminum ingots per year. Coal mining was intensified at Fushun and at all the larger fields; the opencast operation at Fou-hsin in the southwest came to rival the output at Fushun, each producing about 10,000,000 tons annually. The large ammonium nitrate plant at Dairen achieved a yearly capacity of approximately 250,000 tons, its shipyards also greatly increased output, and the railway shops at Dairen and Ch'ang-ch'un were considerably enlarged. The hydroelectric facilities constructed by the Japanese were rehabilitated and expanded as well. The Yalu power plant, shared by North Korea and Manchuria, reached a capacity of about 700,000 kw. and the Ta-feng-man installation a capacity of nearly 600,000 kw.

In addition, scores of new industrial plants were opened. Harbin became a major machine tool centre, as well as a producer of steam turbines and electrical transformers. Aircraft were reported manufactured at Mukden, and fertilizer plants were constructed at Kirin and elsewhere. The power system was enlarged by the construction or expansion of thermoelectric plants in most of the larger cities, and the Manchurian power grid was tied in to that of northern China by a 220,000 kv. line between Chin-chou in Manchuria and T'ang-shan. In addition, a 290,000 kw. hydroelectric plant was under construction on the Hun river, a tributary of the Yalu. The most widely publicized new plant was the automobile factory constructed at Ch'ang-ch'un with Soviet help and opened in 1956; this plant mainly produced five-ton motor trucks, although some automobiles and tractors also were manufactured. The production goal for this plant originally was 30,000 units annually, and its capacity reportedly was increased to 60,000 in 1959, although production probably was less than half that in 1961. Within the Ch'ang-ch'un metropolitan area, a variety of smaller plants were developed to form an automotive industry complex. Numerous consumer goods industries also were established, especially in Kirin and Heilungkiang provinces, producing clothing, electrical appliances, and such items as fountain pens, paper products, wood products and some textiles.

MANCHUS. Manchu is the name given to a people who lived for many centuries in Manchuria and adjacent areas and who in the 17th century conquered China and ruled that country for more than 250 years. The term Manchu dates from the 16th century, but it is certain that the Manchus are the direct descendants of a people who under other names had lived in northeastern Manchuria long before the Christian era. In early Chinese records they are known as the Tung-i or Eastern Barbarians; in the 3rd century B.C. they were given the name of Sushen or Ilu; in the 10th century A.D. the Chinese historians speak of them as Na-chi or Ju-chi, an attempt to transliterate the native word Jurchen. These Jurchen established a kingdom of some extent and importance in Manchuria and by 1115 A.D. had secured control

over northeastern China. In Chinese records this is known as the Chin or Golden dynasty. The kingdom was annihilated by the Mongols in 1234 and the surviving Jurchen were driven back into northeastern Manchuria. Three centuries later the descendants of these Jurchen again came into prominence, but before long they dropped the name Jurchen for Manchu. The Manchus rapidly rose to power under Nurhachi, a tribal leader, who established military and political control over the whole of Manchuria and in 1616 proclaimed himself emperor. Nurhachi fought several successful battles against the Chinese, but died before he could carry out his lifelong ambition to invade China. However, in 1644 an attack took place; Peking, the Chinese capital, fell, and by 1680 the Manchus had complete control over all sections of the Chinese empire. The Manchus managed to maintain a brilliant and powerful government until about 1800 after which they rapidly decayed in energy and ability. It was not, however, until 1912 that the Manchu dynasty was overthrown.

In order to understand the origin and cultural development of the Jurchen-Manchus it is important to bear in mind that Manchuria is divided into two sections: one, to the south and west, is an open, rolling and almost treeless plain, ideally suited for pasturage; the other, to the north and east, is essentially mountainous and is covered with forests. In early times the south and west section was inhabited by the Tunghu tribes, the ancestors of the Mongols, who soon developed a nomadic horse culture; the north and east section served as the home of the Ilu and their descendants, the Jurchens and Manchus. Because of the difference in terrain the Manchus never fully adopted the Mongol culture pattern, even after they secured control over the whole of Manchuria.

Modern research shows that the Jurchen-Manchus are members of a widespread ethnic group known as the Tungus. At an early date, probably about the time of Christ, various Tungus tribes moved from their homeland in or near northeastern Manchuria to the north and west, and eventually occupied most of Siberia between the Yenisei river and the Pacific ocean. In so doing they absorbed some of the earlier inhabitants known as the Paleo-Asiatics. In some cases the latter were pushed farther back into northeastern Siberia where they still remain. With the advance of the Russian settlers in the 17th century, many of the Tungus tribes inhabiting Siberia disappeared, but some still remain, including the Tungus proper, the Lamuts and the Golds. Other Tungus tribes such as the Oroken are still to be found on Sakhalin Island. Basically the Manchus, like all the other Tungus peoples, are members of the Mongoloid race, but it is obvious that they have interbred widely with other peoples as there is wide variation in body type between different Manchu groups. It is almost certain that they have absorbed some of the Caucasoid races (Alpine and proto-Nordic) which inhabited parts of Siberia in prehistoric times. In general, the descendants of the Manchus living in China tend to be slightly taller and lighter in colour than the indigenous Chinese.

From inscriptions in the two languages it is clear that the old Jurchen language and modern Manchu are practically identical. Manchu is also closely related to the other Tungus languages. There is some doubt as to the relationship of Tungus to other languages, but because of similarity of structure, most scholars place Tungus along with Mongolian, Turkish, Hungarian and Finnish in a language group known as Ural-Altaic. In any case it is certain that Tungus is in no way related to Chinese. In writing the Manchus never adopted the Chinese ideographs but employed a phonetic alphabet developed by the Jurchen on the basis of the Mongolian alphabet. The ultimate source of this alphabet is to be found in Syria.

From the Chinese records it is evident that the Ilu, the ancestors of the Manchus, were on a rather low cultural level. Like many modern Tungus tribes in Siberia, they were essentially hunters, fishers and food gatherers, though in later times they and their descendants, the Jurchens and Manchus, developed a primitive form of agriculture. Unlike the Mongols and Turks, the Jurchen-Manchus were noted breeders and eaters of pigs. Pigs also played an important role in their religious myths and rites. It is probable

that the word Tungus is derived from an early Turkish word for pig. From very early times the Jurchen-Manchus were accustomed to braid their hair into a queue or "pigtail." When the Manchus conquered China they forced the Chinese to adopt this custom as a sign of loyalty to the new dynasty. Apart from this the Manchus made no attempt to impose their manners and customs upon the Chinese. After making an unsuccessful effort to abolish foot-binding, they permitted it to go on among the Chinese women, though the Manchu women never adopted this custom. Unlike the Chinese, who until very recent times have shown a marked dislike of dairy products, the Manchus were accustomed to drink milk. But they never attempted to impose milk or any other food upon their Chinese subjects.

After the conquest of China, the greater part of the Manchus migrated there and kept their ancestral estates only as hunting lodges for occasional vacations. Eventually these estates were broken up and sold to or occupied by Chinese immigrant farmers. By 1900 even in Manchuria the Chinese enormously outnumbered the Manchus. Many Manchus in the years following 1644 settled in and around Peking, where they obtained official positions. No effort was made to destroy or even seriously modify the traditional Chinese governmental structure, but in most cases the Manchus were given a good share of the higher administrative posts. Thus the grand council, the highest governmental organ, was usually half Chinese and half Manchu. A large number of Manchus were also incorporated into the mandarin or administrative hierarchy scattered throughout the country. A great many Manchu males became hereditary soldiers, being incorporated in eight special banners or army divisions which were stationed at various strategic posts in order to maintain law and order and to prevent revolution.

Earlier Chinese emperors, such as the rulers of the Han and T'ang dynasties, secured some sort of control over the areas now known as Mongolia, Sinkiang (Chinese Turkestan) and Tibet, but in the 10th century this control was completely lost. The Manchus, after conquering China proper, sent military expeditions into these areas and brought all of them into some form of subjection. But the Mongols, the Turkestanis and the Tibetans believed that they had submitted to the Manchus, and not to the Chinese. Hence they made desperate efforts to regain their independence after the fall of the Manchu dynasty.

Prior to their conquests of China the Manchus were distinctly backward in cultural development, but they were quick to learn once they had gained military and political power. Several of the early rulers of the Manchu or Ch'ing dynasty (especially the emperors K'ang-hsi and Ch'ien-lung, who between them ruled for 120 years) were men of high intelligence and were among the most able and munificent patrons of literature and art that China had ever known. Under their stimulus a Manchu literature was created. Many of these Manchu works were subsequently translated into Chinese. In like manner, many important Chinese works were translated into Manchu and published at imperial expense. The emperor K'ang-hsi gathered together from all parts of the empire the best scholars and set them to work on literary and historical research. As the result of these efforts there appeared the *K'ang-hsi tsu-tien*, still the standard dictionary of the Chinese language, and the authoritative "imperial edition" of the Chinese classics. A little later the Manchu court fostered the publication of a gigantic encyclopaedia comprising more than 1,500 volumes. The Manchu rulers were also noted patrons of ceramic art, and the types of porcelain known as K'ang-hsi and Ch'ien-lung ware are still prized museum pieces.

The Manchu emperors, in spite of their patronage of Chinese culture, made strenuous efforts to prevent the Manchus from being absorbed by the Chinese. The Manchus were urged to retain their own language and to give their children a Manchu education. Attempts were made to prevent the intermarriage of Manchus and Chinese, so as to keep the Manchu strain racially pure. Too much social intercourse between the two peoples was frowned upon. All these efforts proved fruitless. During the 19th century, as the dynasty decayed, the efforts to preserve cultural and racial segregation gradually broke down. The Manchus began to adopt

Chinese customs, to speak the Chinese language and to intermarry with the Chinese. When the dynasty was overthrown, and it became politically inexpedient to be known as a Manchu, the Manchus quietly disappeared into the main mass of the Chinese populace.

MANCINI, PASQUALE STANISLAO (1817-1888), Italian jurist and statesman, a man of the Risorgimento and a liberal minister in the early years of the kingdom of Italy, was born on March 17, 1817, at Castel Baronia, in the kingdom of the Two Sicilies. A deputy in the Neapolitan parliament of 1848 he stood for genuine constitutionalism; and on the dissolution of the parliament in March 1849 he upheld the same cause, both as a journalist and as a lawyer for the defense of prosecuted liberals, till he was driven into exile in May. Going to Piedmont, he was appointed professor of international law at Turin in 1850. His first lectures, published as *La Nazionalità come fonte del diritto delle genti* (1851), were a notable contribution to the ideology of the Risorgimento. Elected to the parliament of Sardinia-Piedmont in 1860, he was sent in 1861 to be a member of the Sardinian council of lieutenancy over the newly conquered territory of the Two Sicilies, where he suppressed the religious orders, renounced the concordat with the papacy and proclaimed the state's right to church property. Returning to Turin, he sat with the centre in the first parliament of united Italy; and in March 1862 he was minister of education for 18 days under Urbano Rattazzi. In 1865 he won a great personal triumph by securing a considerable limitation of capital punishment. Finally identified with the left by 1867, he was minister of justice under Agostino Depretis from 1876 to 1878. As acting minister of public worship in 1878, he assured the cardinals that the Italian government would not interfere with the conclave for the election of Pope Pius IX's successor (the first held since Italy's occupation of Rome). Minister of foreign affairs under Depretis from 1881, he angered the irrealists by his *rapprochement* with Austria-Hungary and in May 1882 committed Italy to the Triple alliance with Austria-Hungary and Germany. In colonial policy he failed to promote any expansion of Italy's power in the Mediterranean area; and though he had to sponsor the occupation of Eritrea he could not prevent France's progress in Somaliland. Public discontent at his hesitant policies forced him to resign in June 1885. He died at Reggio di Capodimonte, Naples, on Dec. 26, 1888.

MANDAEANS, a Gnostic sect surviving in southern Iraq and Khuzistan, known to Arab and Iranian neighbours as *Sabians* ("dippers"). They call themselves *Mandaia* (literally "Gnostics"), though this now designates Mandaean laymen exclusively; priests are *tarmidia* ("disciples") and those priests initiated into secret doctrine are *Nasurāia* (Nasoraean). The religion as taught to the layman is syncretistic, and personifications of qualities, aspects and emanations of the Great Life, as they call the supreme Being, appear in a number of myths, which are often self-contradictory. The religion survives chiefly through its insistence on cult, baptism particularly, which is looked upon as necessary for all kinds of pollution and essential for salvation. Some personifications are saviour-figures, such as Manda-d-Hiia ("Knowledge of Life"), Hibil-Ziwa ("a light-bearer"), Yawar-Ziwa ("Awakening" or "Arousing Light") and *kushta* ("good faith", "truth," also a personification of the ritual handshake which symbolizes pact and alliance). Both beneficent spirits (*utria*) and demons are innumerable. Illness is caused by possession by disease-demons, and the devout prefer exorcism to medicine. Baptism is followed by the administration of simple sacraments of water (*mambuki*, and bread (*pihta*), and this rite is one of a series of *razia* ("mysteries" of which the most important is the *masiqta*, a solemn ritual meal celebrated by priests only for the "raising up" (or resurrection) of the dead. Other ritual meals are *Lofani*, a lay meal eaten in commemoration of and for the benefit of the dead, and the Blessed Oblation at marriage and burial. As in other Gnostic religions the body is called the "tomb of the soul" and death is looked upon as a release from prison.

Up to the beginning of the 20th century the Mandaean were only white, did not cut their hair and avoided pollution with others.

But modern education and the introduction of cars, radio and commercial enterprise tend to destroy their separatism, and the sect is fast disappearing.

The name "Christians of St. John" given to Mandaeans by medieval travelers originated because their priests claim John the Baptist as a member of their sect (the Nasoraean), but Jesus is to them a false Messiah, and ascetic practices of Christians such as celibacy were and are abominable to worshipers of the Life. Mandaean tradition, supported by internal evidence and scholarly research, claims the west as the original home of the sect, although the language of their texts is an eastern dialect of Aramaic (see SEMITIC LANGUAGES: *Aramaic*). References in Mandaean literature to a flight from Judaea and persecution there point to connection with early Jewish Gnosticism. Libraries, consisting of scrolls and codices in Mandaic characters, are composed chiefly of fragments of pre-Muslim compositions, collected directly after the Muslim conquest (7th century A.D.). There are also post-Muslim writings and magical and astrological manuscripts of uncertain date. Most of the manuscripts are in the Bodleian library, Oxford (the Drower collection); others are in Berlin, Paris and London. See also Gnosticism.

MANDALA (Sanskrit "circle"), in Hindu and Buddhist Tantrism, is a holy precinct prepared in honour of a Buddha or other divinity and sometimes used for the performance of a sacred rite. It is also a representation of the cosmos, a consecrated area in which the forces of the universe are collected. These forces are represented by images or signs of divinities, by ritual instruments or by other symbolic means.

In Tibet, China and Japan the *mandala* is commonly presented in graphic form on paper, silk or other material. Despite the basic meaning of the Sanskrit word, *mandalas* are commonly square or rectangular in shape and divided into various sections, or "courts." In Tantrism and in esoteric Buddhism the *mandala* is a "support for meditation"; that is, the adept uses the *mandala* as an object of meditation, progressively obtaining possession of the energies represented by the various images or symbols.

In Japan the *mandala* of the Shingon sect is twofold: the

taizōkai, or "womb world," and the *kongōkai*, or "diamond world." These two *mandalas* represent the whole of the universe, being simply two differing aspects of it. In both *mandalas* the solar divinity Vairocana (Jap. Dainichi) occupies a central position; all surrounding divinities are but aspects of him. Vairocana and the other divinities may be represented by symbols, e.g., by "seed letters" (Jap. *shuji*), which embody the essence, the energies, of the gods in question.

Movement in the diamond world tends to converge inward, to be centripetal, representing a reintegration of multiplicity to unity; in the womb world it is centrifugal, outward from the centre, from the unitary to the many.

(E. D. S.)

MANDALAY, formerly capital (now chief town) of Upper Burma, headquarters of the Mandalay division and a district of the Union of Burma, stands on the Irrawaddy river. It was built mainly in 1857–59 by King Mindon to replace Amarapura (*q.v.*) as his capital. The population (185,867 in 1953) is mixed, but as Burmese Buddhists predominate Mandalay is far more Burmese than Rangoon. It is a great Buddhist religious centre and the abode of large numbers of monks (*Hpongyis*). Occupied by the Japanese during World War II the town was almost completely destroyed, sustaining the heaviest damage during the 12-day siege in March 1945 when it was retaken by the 14th army commanded by Gen. Sir William Slim.

The area inside the old walls of the royal palace (*Nandaw*) and environs is called Fort Dufferin. In the centre the palace itself (a group of wooden buildings, many of them highly carved and gilded, resting on a brick platform 900 by 500 ft. and 6 ft. high) stood until its destruction during the war. Mandalay hill (744 ft.) has innumerable monasteries, pagodas and monuments all of comparatively modern creation. It overlooks the *Kuthodaw* or "seven hundred and thirty pagodas" and the city. The city, west of the palace walls, was laid out on a gridiron plan and has little of interest apart from numerous bazaars (notably the large Zegyo bazaar) and some fine pagodas. Higher educational facilities are provided by the University of Mandalay (formerly University college affiliated to Rangoon university and raised to university status in 1958), a training college for teachers, a technical institute and a school of fine arts, music and drama. Trains run from Mandalay to Rangoon, to Myitkyina and to Lashio, the beginning of the Burma road to China. Steamers ply up and down the Irrawaddy.

MANDALAY DISTRICT has an area of 2,113 sq.mi. and a population (1962 est.) of 499,865. About 600 sq.mi. of land along the Irrawaddy are flat and nearly all cultivated. In the north and east there are hills and plateaus (1,500 sq.mi.) forming geographically a portion of the Shan plateau. This part of the district is well wooded and watered. The Maymyo (*q.v.*) subdivision has plateaus with an altitude of 3,000–3,600 ft. The Myitnge and Madaya drain from the Shan state, and are navigable for between 20 and 30 mi. of their plains course. Mingun, a village on the banks of the Irrawaddy about 7 mi. N. of Mandalay, has one of the world's largest ringing bells—weighing about 90 tons.

The Sagyin hills near Madaya are noted for their alabaster, which is carved into statues of Buddha in Mandalay. On the plains the climate is dry and healthful, the rainfall averaging about 30 in. Considerable areas are irrigated for agriculture. The hilly eastern tracts have a heavier rainfall—about 60 in.—and are forested. The extremes of temperature on the plains are considerable, ranging from 13° C. (55° F.) in December to 43° C. (110° F.) in July. The climate is typical of the centre of Burma's dry belt.

MANDALAY DIVISION in 1958 included the districts of Mandalay, Kyaukse, Meiktila, Myingyan and Yamethin, with an area of 13,225 sq.mi. and an estimated population in 1962 of 2,543,401.

(L. D. S.)

MANDAMUS, WRIT OF, originally a formal order of high prerogative issued by the crown commanding an official to

COURTESY, MUSEUM OF FINE ARTS, BOSTON; BIGELOW COLLECTION
CENTRE DETAIL OF JAPANESE TAIZŌKAI MANDALA, LATE 17TH CENTURY. IN THE MUSEUM OF FINE ARTS, BOSTON

perform a specific act within the duty of his office (Lat. *mandamus*, "we command"). It later became a judicial writ issuing from the court of king's bench in the name of the king at the request of individual suitors whose interests were alleged to be adversely affected by the failure of an official to act as his duty required.

It is not awarded as a matter of right but rather at the discretion of the court, and, although classified as a legal remedy, it is largely controlled by equitable principles. It is not ordinarily granted where an alternative remedy is available and, it is said, never where the official to whom it would be directed has legal discretion to perform the act demanded or to abstain from doing so.

In both England and the United States *mandamus* is used by courts of superior jurisdiction to compel the performance of a specific act refused by a lower court, such as the hearing of a case falling within the latter's authority. See PRACTICE AND PROCEDURE; APPEAL. (P. B. K.)

MANDAN, a Siouan tribe classified as village Indians along with the culturally and historically related Hidatsa and the Arikara (*qq.v.*) in the U.S. central plains. Said to number about 1,250 in 1804, they were reported reduced to less than 150 in 1837, largely due to smallpox. Because of loss of Mandan tribal identity among the Hidatsa, modern population estimates for them have varied; however, in the 1960s the total Indian population reported on the Fort Berthold, N.D., lands shared by Mandan, Arikara and Gros Ventres was 1,826. Their language allies the Mandan with the Winnebago, consistent with a vague tradition suggesting they once lived farther east. At one time theories were offered deriving them from the Ohio mound builders and even from the Welsh of the British Isles. Anthropologists have rejected these as fantastic.

In the 19th century the Mandan lived in dome-shaped, earth-covered lodges clustered in stockaded villages; they planted maize, beans, pumpkin and sunflower, hunted buffalo seasonally and made pottery. They had an origin myth of emergence from the lower world by climbing the roots of a grapevine; they treasured a sacred palladium in an ark and performed distinctive ceremonies that involved Plains elements. Mandan culture thus had eastern or southeastern affiliations; its drift in the historic period was upward along the Missouri river. They were called tattooed people in the sign language, and occasionally tattooed themselves on the left arm and chest. Traditionally, a Mandan man could practice polygamy, being entitled to marry his wife's younger sisters.

(A. L. K.; X.)

MANDARIN, the common name for all public officials in imperial China, the Chinese name for whom is *kuan*. The word comes through the Portuguese from Malay *mantri*, a counselor or minister of state. With the passing of the old order in China the term, as applied to officials, went out of use.

The words "mandarin language" remained in use, though inappropriately so. Originally the term was used to describe the language as spoken in the capital city of Peking and, with local variations, in most parts of China away from the coast. The proper name is the national language, or *kuo-yü*, taught all over the country.

The mandarin duck (*yüan-yang*) is so described because of its bright, variegated plumage like the dress of the mandarins in imperial China.

The mandarin orange (*kan*) is so called because of its resemblance in colour, shape and size to the large button perched on the hat of those high officials, or very likely because of the similarity in colour to the brilliant yellow of their silk robes.

(L. M. L.)

MANDATE refers generally to an authorization to act, but the connotation is different according as the term is used in a

political, administrative or legal context. Politically, a mandate is an instruction from a constituency to its elected representative in a legislative body or to a policy enjoined upon the legislature as a whole by the results of an election (see REPRESENTATION; ELECTORAL SYSTEMS). Administratively, a mandate is an authoritative command or order, especially an order from a superior to an inferior court, a papal ordinance dealing with an individual case, or an order from the Roman emperor to a provincial officer. In private law and, by analogy, in international law the term refers to an authorization by one person or one nation to act for another. In Roman law it is a contract constituted by one person (the *mandatarius*) promising to do something gratuitously at the request of another (the *mandator*), who undertakes to indemnify him against loss.

The essentials and the terminology of the contract are preserved in most modern systems; but in English law, mandate, under that name, can hardly be said to exist as a separate form of contract. To some extent the law of *mandatum* corresponds to the law of principal and agent. "Mandate" is retained to signify the contract more generally known as gratuitous bailment. It is restricted to personal property, and it implies the delivery of something to the bailee, both of which conditions are unknown in the *mandatum* of the civil law (see BAILMENT).

Mandate System of the League of Nations.—The treaty of Versailles set up various conditions for the administration of the former overseas possessions of Germany and Turkey, under which mandatory powers were selected by the supreme council of the Allies to administer the territories under mandate. This system was a novel experiment in the relations between a sovereign state and a country under its control, involving new departures in international law. It was created by art. 22 of the covenant of the League of Nations, which formed part of the treaty of Versailles and thus gained the recognition of all states that were members of the League. Upon formation of the United Nations in 1945, the mandate system was superseded by the trusteeship system, and most of the mandated territories became trust territories. (See TRUSTEESHIP SYSTEM.)

In its origin the mandate system was in the nature of a compromise. After World War I the victorious Allies naturally wished to retain the German and Turkish colonies, in the conquest of which they had in most cases made great sacrifices. Pledges had been made to the native inhabitants, some of whom had taken part with the victors in the fighting, that they should not be handed over to the vengeance of their former masters; and finally a misgiving existed lest, in case of rendition, Germany might use them as recruiting grounds for native armies, and their ports as bases for submarines in a future war. On the other hand the Allies had declared (more particularly in the pre-Armistice statement of Nov. 5, 1918) that annexation of territory was not their aim in the war.

International control of some kind was the only alternative. Joint administration was believed to be impracticable and opposed to the interests of the people. Even as a condominium between two powers only, it had given rise to friction in Egypt, Samoa and the New Hebrides. The only other course lay in the appointment of an individual power in whom could be vested responsibility for the administration of each separate territory as an agent or mandatory of the League. For this course there were analogies in the delegation of quasi-sovereign powers to British and Dutch chartered companies and in the control of the Ionian Isles on behalf of the powers by Great Britain in 1815, and of Morocco by France under the Algeiras treaty of 1906. Individuals also had been appointed as mandatories of the powers, as when King Leopold II of Belgium undertook control of the International Free State of the Congo, and when Prince George of Greece was made governor of Crete in 1898.

The main defect of these delegations of sovereignty was that they provided no machinery to ensure the due execution of the trust, and it was the distinctive feature of the mandate system that it attempted to remedy this defect. The League of Nations afforded just such a supervisory authority as was needed, and its supervision was exercised through the medium of a standing com-

mittee known as the Permanent Mandates commission. The League did not assign the mandates or define their terms or the extent and boundaries of the territories. These were determined by the supreme council and confirmed by the League council, which had authority under the covenant to define "the degree of authority, control or administration to be exercised by the mandatory if not previously agreed on by the members of the League."

The United States, not being a member of the League, was no party to this arrangement, but it insisted that as an associated power its consent was necessary. The mandates therefore were submitted to the United States and approved on condition that "free and equal treatment in law and in fact was secured to the commerce of all nations." The United States negotiated separate treaties with most of the mandatories securing its interests.

Terms of the Mandates.—The mandates were framed to give expression in detail to the principles embodied in art. 22 of the covenant; and since that article prescribed that their character must vary with the varying conditions of each territory, they were divided into three classes to correspond with the three paragraphs of that article.

Class A included the former Turkish vilayets of Iraq, Palestine and Syria, whose independence was to be provisionally recognized until they were able to stand alone. The two former were assigned to Great Britain, the latter to France. These mandates came to an end through recognition of the independence of Iraq in 1932, of Syria and Lebanon in 1941, of Trans-Jordan in 1946, and of Israel in 1948. The last two comprised the Palestine mandate.

Class B comprised the former German central African colonies—Togoland, Cameroons, Tanganyika and Ruanda-Urundi—in which the mandatory was responsible for the administration and undertook to promote the moral and material welfare of the people. Tanganyika and a small part of the Cameroons and Togo fell to Great Britain, the major portions of the latter two being assigned to France, while Belgium became responsible for Ruanda-Urundi. These territories all became trusteeships under the United Nations, with the same administering powers. In 1956 British Togoland was, with approval of the United Nations following a plebiscite, joined to the Gold Coast, which soon became the independent state of Ghana. French Togoland became an autonomous republic within the French Union in 1956 and was proclaimed an independent republic in 1960. Tanganyika attained independence in 1961 and Ruanda-Urundi (as Rwanda and Burundi) in 1962.

Class C territories included those which could "best be administered under the laws of the mandatory as integral portions of its territories, subject to the safeguards in the interests of the indigenous population" which were laid down for class B. The territories were South West Africa, Samoa, New Guinea, the islands north of the equator in the west Pacific and the tiny island of Nauru. For these, respectively, the Union of South Africa, New Zealand, Australia, Japan and Great Britain accepted mandates. Western Samoa attained independence on Jan. 1, 1962.

In the case of Nauru, in July 1919 (before the issue of the mandate) Great Britain, Australia and New Zealand had by agreement jointly acquired control of the phosphate deposits, which constituted the sole value of the island, and they jointly undertook the execution of the mandate. Since, however, the British Commonwealth had no single code of laws, the administration was assigned to Australia.

These territories all became trusteeships under the United Nations except South West Africa. The International Court of Justice held in 1950 that the latter continue under the mandate of South Africa, with supervisory authority vested in the United Nations general assembly. The United States became trustee of the former Japanese mandated islands. The others retained the same administering authorities.

The "safeguards in the interests of the indigenous population" were: (1) freedom of conscience and religion, subject only to the maintenance of public order and morals; (2) prohibition of abuses, such as the arms and liquor traffic and the slave trade; and (3) prevention of fortifications, naval and military bases and the

military training of natives except for police and the defense of the territory.

After acceptance by each mandatory, the mandates were confirmed by the League council, which was charged with seeing that their terms were in accord with the covenant and whose consent was required for any alteration. The A class could not be issued until the treaty of Lausanne came into force (Aug. 1924). The mandate was to be a "sacred trust of civilization" assumed by nations who (*inter alia*) "by reason of their resources can best undertake this responsibility and are willing to accept it." The altruistic nature of this pledge was confirmed in a reply to a German protest. "The Mandatory Powers," said the Allies, "in so far as they may be appointed trustees by the League of Nations, will derive no benefit from such trusteeship." A mandated territory differed from a protectorate in that the protecting power obtained rights over the population and against other powers, whereas a mandatory in its capacity as guardian assumed obligations both toward the population and the League.

League Supervision.—The system differed from such partial precedents as have been cited in that it set up machinery by which the proper execution of the mandate might be assured. This consisted in the unqualified right of supervision vested in the League, which imposed upon each mandatory the obligation to submit an annual report on its administration.

These reports were examined by a permanent mandates commission in the presence of an accredited representative of the mandatory concerned. The commission originally consisted of nine members of the following nationalities: Belgian, British, Dutch, French, Italian, Japanese, Portuguese, Spanish and Swedish. To these a Swiss and a German were later added, and a Norwegian superseded the Swede. The majority were nationals of nonmandatory states. The members were selected "for personal merit and competence" as private individuals, and not as representatives of their respective nations. They were nominated by their governments, but approved and appointed by the League council, and could not hold any office under their government. A representative of the International Labour office attended the sessions and took part in any discussions relative to labour. This international composition negated any suspicion of bias and gave to the commission the aspect of an impartial tribunal of practical men whose object was to promote co-operation while fearlessly exposing any breach of the covenant. Its functions were purely advisory to the council.

In addition to the annual review of the reports of the mandates, the commission received any petitions and memorials from inhabitants of the territories and others interested, and these, unless trivial or irrelevant, were forwarded to the mandatory concerned for comments before examination by the commission. The proceedings were conducted in French and English and were generally held in private to facilitate freedom of discussion. Full minutes were printed and given publicity. A permanent secretariat, under a director, collected and circulated all documents of interest concerning mandates and conducted the routine business. The commission met at least twice a year at Geneva; its procedure was governed by rules approved by the council.

The weak point in the system lay in the impossibility of independent verification of statements contained in the reports, which varied in completeness and accuracy. The League council refused to permit the permanent mandates commission to visit the mandated territories or to hear oral petitioners, but the International Court of Justice in 1956 authorized the general assembly committee on South West Africa to hear petitioners from that territory. After Japan's withdrawal from the League in 1933, the reports on its mandate were inadequate. For information not contained in the report, the commission had to rely on those public bodies or individuals who interested themselves in the welfare of native races and on such memorials and petitions as were presented to it. In order to obtain more accurate information, the actual administrators generally appeared as the mandatory's representatives. The only practical means at the disposal of the League for compelling the proper execution of the mandate was the force of public opinion, although in theory the League could transfer a

mandate if the mandatory grossly violated its obligations.

The French mandates in west Africa—unlike the British mandates for portions of the same territories (Cameroons and Togo)—contained a clause to the effect that “troops thus raised” (i.e., for purposes of local defense and police) “may in the event of general war be utilized to repel an attack, or for defense of the territory outside that subject to the mandate.” It was difficult to reconcile this clause with the words of the covenant. At the instance of the Mandates commission the British government was willing to go even further than the covenant prescribed, and agree to pledge itself not to enlist the natives of a mandated territory, even though they offered themselves for enlistment outside its frontiers, thus limiting its sovereign rights in adjacent territories not under mandate. The French government declared its willingness to accept the same restriction.

Prevention of Abuses.—The covenant enjoined the “prohibition of abuses such as the slave-trade, the arms traffic and the liquor traffic.” Some urged that these words meant the enforcement of total prohibition alike for natives and nonnatives. The mandates, however, only prescribed a “strict control over the sale of spirituous liquors.” The rights of the natives and the prevention of material advantages to the mandatory were major concerns of the League. To this end financial accounts were carefully scrutinized, as were administrative or customs unions of mandated territories with adjacent colonies of the mandatory.

In the matter of equal commercial opportunity for all nations, the covenant itself failed to fulfill the expectations raised by the pre-Armistice declarations of the Allies. No obligation in this regard was imposed in the C mandates, while in the B class it was restricted to states which were members of the League.

Boundaries.—Another cause of practical difficulty was presented by the fact that in some cases the boundaries of the territories assigned under mandate were not defined. In the case of Iraq this led to an acute dispute with Turkey in regard to the northern boundary. It was eventually settled by the council of the League, advised by a special commission sent to the area. The southern frontiers were the subject of an agreement with the sultan of Nejd, and an Anglo-French agreement determined the frontiers with Syria. The French in northern Syria had similar difficulties with Turkey, to which they ceded Cilicia and later Alexandretta (now Iskenderun). In the Cameroons a joint commission was set up to determine the precise boundaries, while with regard to Ruanda, the mandatory (Belgium) complained that the agreed boundary involved the loss to King Musinga of a considerable part of his territory. The British at once agreed that this area should be restored to him, and the consequent changes in the mandates were approved by the council. In South West Africa a neutral zone had long existed between the German and Portuguese colonies. This was replaced by a precise demarcation embodied in a treaty between the Union of South Africa and Portugal.

Sovereignty.—Wider issues were raised by such questions as the nature and extent of sovereignty exercised by a mandatory and the international status of the inhabitants of a mandated territory. The mandatory was authorized to make and enforce laws, to raise troops, to set up tribunals, to appoint officials and to raise and spend revenues. Sovereignty was not ceded by the treaty of Versailles to the League, but to the “principal allied and associated powers” who were obliged to place the territories under “mandatories on behalf of the League.” The highest court in South Africa recorded the opinion that the territories were not ceded at all but placed by Germany at the disposal of the Allies, to be administered under mandate—a status new to international law. (*Rex v. Christian*, S.Af. L.R. [1924], App. Div. 101.)

The mandatory’s powers were exercised “in its capacity as such.” Any action on the part of the mandatory which had for its object (or would ultimately involve) annexation—as for instance the acquisition of large monopolistic rights, or of essential public services—was held to be contrary to the covenant and the mandate.

Juristic opinion differed as to the location of sovereignty in the sense of capacity to change the status of the territories. Arguments were made for the mandatory, the principal allied and associated powers, the mandated communities, the League of Nations

and various combinations of these. Opinion tended, however, to accept the theory of ultimate League sovereignty; and practice gave support to this theory, particularly if the United Nations was to be regarded as the successor of the League. Art. 80 of the UN charter recognized that mandated territories remained in *status quo* until changed by appropriate action in accord with that instrument.

Status of Natives.—The status of the indigenous inhabitants of a class B or C mandate territory was the subject of special definition. Since the country was not annexed, its inhabitants did not become the subjects of the mandatory. The formula was therefore adopted by the council that “they should be designated by some form of descriptive title which would identify them as such,” viz., as “persons administered or protected under mandate.” Art. 327 of the treaty of Versailles stipulated that they should be entitled to the diplomatic protection of the mandatory when outside the mandated territory; individuals could, if they so desired, become naturalized subjects of the mandatory.

The application to mandated territories of special conventions, entered into by a mandatory power, was the subject of investigation and recommendation by the Mandates commission, in order to ensure that “persons protected under mandate” should not be in a less favourable position in regard to their persons and property and their economic interests than the inhabitants of a protectorate or colony. The terms of the covenant contemplated self-government as the natural fruition of the mandate and all of the A class territories achieved that status.

The mandate system for the first time in history accorded international sanction to the principles of “trusteeship,” of “tutelage” and of “mandate.” The annual report formed an effective means of inviting a popular verdict on the fulfillment of the trust and supervision by the League, constituted a fundamental distinction from annexation, whatever the degree of assimilation to other possessions of the mandatory.

The standards of the covenant came to be regarded as principles of general application and contributed both to the welfare and self-determination of dependent peoples. The mandate system was an acknowledgment of the international responsibility of powers that exercise control of “peoples not yet able to stand by themselves” and a contribution to the peaceful liquidation of “colonialism.”

BIBLIOGRAPHY.—The mandates section of the League secretariat issued a *List of Books and Pamphlets Relating to the Mandates System and to Territories Under Mandate*; a bibliography was also prepared by the Royal Colonial Institute. See D. P. W. Van Rees, *Les Mandats internationaux* (1927); L. M. Palacios, *Los Mandatos internacionales* (1927); Benjamin Gerig, *The Open Door de la Sociedad de naciones* (1927); Quincy Wright, *Mandates Under the League of Nations* (1930); H. D. Hall, *Mandates, Dependencies and Trusteeship* (1948). (Lr.; Q. W.)

MANDAYA, a pagan Philippine group occupying the mountain area of southeast Mindanao. There was no traditional tribal organization but each district had its headman. To become a leader (*bagani*) and be allowed to wear distinctive red garments a man was required to kill a certain number of enemies. The Mandaya were once regarded as one of the most warlike groups in the Philippines; because of constant warfare, houses were built in trees or set on high piles. A clearing where scanty crops were grown surrounded each settlement. Hunting and the search for jungle products augmented the food supply. By the 1960s Muslim and Christian settlers had developed hemp plantations along the coast. These together with government control did away with most of the intertribal warfare. Both sexes traditionally wore embroidered jackets to which they attached silver disks. A breechcloth completed the male costume, while elaborate wrap-around hemp skirts were worn by women.

MANDEL, GEORGES (1885–1944), French political leader noted for his hostility to Nazi Germany, was born at Chatou, near Paris, on June 5, 1885. His real name was LOUIS GEORGES ROTU-

SCHILD and he was a member of a prosperous Jewish family, although not connected with the bankers of the same name. In 1904 he became a contributor to Georges Clemenceau's journal *L'Aurore* and greatly impressed "le Tigre" who appointed him to his personal staff when he formed his first government (1906-09). Mandel continued to serve Clemenceau in office and opposition alike particularly with his journals, *L'Homme libre* and *L'Homme enchaîné* and as the head of his personal staff during his second premiership (1917-20).

Mandel was elected a deputy in 1919, lost his seat in 1924, but served again from 1928 to 1940. He was a conservative, strongly opposed to the social and economic policies of the left but equally opposed to the pro-German policies of many conservatives in the period between World Wars I and II. He was minister of posts in four successive governments (1934-36) and minister of colonies from April 1938 to May 19, 1940, when Paul Reynaud transferred him to the ministry of the interior. The Germans were already advancing into France and Mandel's appointment came too late for him to deal vigorously with traitors. He strongly supported Reynaud's advocacy of continuing to fight from Africa. On becoming premier Marshal Philippe Pétain ordered the arrest of Mandel, but Mandel insisted on seeing Pétain and, in a stormy interview, browbeat him into signing an acknowledgment that he had been mistaken and that Mandel was a true patriot. Mandel was among the political leaders who sailed from Bordeaux on the "Massilia" (June 21) with a view to continuing the war. Arrested in Morocco, he was transported to France and imprisoned at the Château de Chazeron (Sept. 9, 1940). He was among the former ministers arraigned in the Riom trials (Oct. 1941-April 1942). Imprisoned at Le Portalet, he was delivered to the Germans in Nov. 1942. After a stay at the concentration camps of Oranienburg and Buchenwald he was sent back to Paris on July 4, 1944, and shot three days later in the forest of Fontainebleau by order of Joseph Darnand, head of police of the Vichy government.

See P. Coblenz, *Georges Mandel* (1946).

(P. W. C.)

MANDELKERN, SOLOMON BEN SIMHAH DOB (1846-1902), Hebrew poet and grammarian best known for his Hebrew-Latin concordance to the Hebrew Bible, was born in Mlinov, Volhynia, Ukraine. He followed his rabbinical studies in Dubno and Vilna (Vilnius) by reading oriental languages at St. Petersburg university. An assistant rabbi at Odessa from 1873, he introduced the sermon in Russian before moving to Leipzig about 1880 where he worked as writer and teacher. He died in Vienna on March 24, 1902.

Although a prolific and gifted Hebrew poet with a vigorous and attractive style, Mandelkern was soon overshadowed by his younger and greater contemporaries. His best poems are contained in two volumes entitled *Shire Sefat 'Eber* (1882 and 1889) while his versions of Byron's *Hebrew Melodies* (published as *Shire Yeshurun*, 1890) are equally successful. He is the author of numerous satires, epigrams and translations from and into Hebrew, Russian and German, as well as a three-volume history of Russia written in Hebrew. His *Hekal ha-Kodesh* or *Veteris Testamenti Concordantiae* (1896), although not without shortcomings, excels all earlier attempts in method and completeness. It includes all verbs, adverbs, prepositions, conjunctions, pronouns and proper names, of which the last two categories as well as the Aramaic words are listed separately at the end. The lengthy note preceding each article or word makes this concordance a valuable contribution to Hebrew lexicography, grammar and syntax, as well as to biblical exegesis. An abridged edition appeared under the title *Tebnit Hekal* (1897).

(D. PA.)

MANDER, KAREL VAN (1548-1606), Dutch painter, poet and biographer of painters, was born of a noble family at Meulebeke. He studied under Lucas de Heere, at Ghent, and in 1568-69 under Pieter Vlerick, at Courtrai and Tournai. The next five years he devoted to writing religious plays, for which he painted the scenery. In 1574-77 he studied in Rome, where he made the acquaintance of Bartholomaeus Spranger. On his return journey he passed through Vienna, where he collaborated with Spranger and the sculptor Hans Mont on the triumphal arch for the entry of the emperor Rudolf II. After much wandering he

settled at Haarlem, where, with H. Goltzius and C. Cornelisz, he founded a successful academy of painting. His fame is principally based upon a biographical work on the painters of various epochs—a book that has become for the northern countries what G. Vasari's *Lives of the Painters* became for Italy. It was completed in 1603 and published in 1604, in which year Van Mander went to Amsterdam, where he died on Sept. 2, 1606. He translated Virgil's *Bucolics* and *Georgics*.

His *Het Schilderboeck* (1604) was translated into French by H. Hymans (1884) and into German by H. Floerke (1906). The poem in 14 chapters dealing with the technique of painting, which forms the introduction, was used as a source of information by Charles Eastlake in *Materials for a History of Oil Painting* (1847).

(R. E. W. J.)

MANDEVILLE, BERNARD DE (1670-1733), the Dutch physician who made his name in England as a satirist and philosopher and won an international reputation with his paradoxical defense of the utility of "vices," was born at Rotterdam, the Netherlands, in Nov. 1670. He was graduated doctor of medicine from Leiden university in March 1691 and started to practise but soon went abroad. Arriving in England to learn the language, he "found the Country and the Manners of it agreeable" and settled in London. In Feb. 1699 he married Ruth Elizabeth Lawrence, by whom he had two children. A physician of repute, he enjoyed the friendship of Sir Hans Sloane and the patronage of Lord Chancellor Macclesfield. Benjamin Franklin found him "a most facetious, entertaining companion." He died at Hackney on Jan. 21, 1733.

Mandeville learned English quickly. His first English works, published in 1703 and 1704, were burlesque paraphrases from La Fontaine and Scarron. In April 1705 he published *The Grumbling Hive: or, Knaves Turn'd Honest*, a satirical allegory in verse, in which he maintained that, though men bewail the vices which render uneasy their prosperity and comfort, nevertheless material civilization is the product of vices gratified and not the work of virtue. He next elaborated this argument in *The Virgin Unmask'd* (1709), ten robust dialogues between two strongly characterized speakers on the manners of fashionable society. In *A Treatise of Hypochondriack and Hysterick Passions* (1711), on nervous and digestive medicine, Mandeville discounts the operations of pure reason in physics and treats scientific hypotheses as having a pragmatic, not an absolute, value. A collection of trifles followed in 1712 and a Whig tract in 1714.

In 1714 Mandeville published the first edition of the work for which he is best known, *The Fable of the Bees*, subtitled *Private Vices, Publick Benefits*. This edition consisted of a preface, the text of *The Grumbling Hive*, an "Enquiry into the Origin of Moral Virtue" and "Remarks" on the poem. An enlarged edition (1723), augmented with a strictly utilitarian essay on "Charity and Charity Schools" and an examination of "The Nature of Society," provoked a long controversy. In 1729, however, Mandeville published *Part II* of the *Fable*, in which he recast the entire argument. Without abandoning his original purpose of diverting his readers, he had discovered a philosophical commitment to his position.

Mandeville adopts a rigoristic definition of virtue, a motive totally selfless and completely rational, in no respect alloyed by passion. This enables him to categorize as equally vicious all human actions, which are all motivated by some self-interest, such as desire for comfort or praise, or pride. Yet while the motives must be vicious, the results of action are usually beneficial and agreeable to man, producing the comforts of civilization (apart from crimes, which Mandeville distinguished from beneficial vices). These comforts, however, are irreconcilable with the strict virtues of true Christianity. Extreme in his rigorism, discounting the efficacy of divine grace and assuming nothing in man's nature save the ability to survive in the world, Mandeville on the one hand challenged contemporary orthodoxy, which preached Christianity but practised politeness, and on the other developed a psychology related not to abstract ideas but to man's physical environment. More direct than Hobbes or Locke as a psychologist, he approached the utilitarian position more subtly than Bentham was later to do. His economics tended toward complete *laissez-faire* and seem to have had some influence on Adam Smith.

Mandeville's *Fable* went through many editions and had a European vogue. Before the second edition of the *Fable*, however, he had attracted attention in Europe with his *Free Thoughts on Religion, the Church and Natural Happiness* (1720). Later works included *A Modest Defence of Publick Stews* (1724), *An Enquiry into the Causes of the Frequent Executions at Tyburn* (1725), *An Enquiry into the Origin of Honour, and the Usefulness of Christianity in War* (1734) and *A Letter to Dion* (1732; on Berkeley's *Alciphron*).

Rosenberg, "Mandeville and Laissez-Faire," *Journal of the History of Ideas*, vol. xxiv, 2 (1963).

MANDEVILLE, GEOFFREY DE (d. 1144), earl of Essex, was easily the worst of a number of cruel and lawless barons whose conduct in Stephen's reign made men say openly, according to the Peterborough chronicler, that Christ and his saints slept. A great landowner in Essex and elsewhere, and hereditary constable of the Tower of London, he came to prominence in 1140 when Stephen, who could not dispense with his support against Matilda, made him hereditary earl of Essex, by the earliest charter granting an English earldom extant or even known. When Stephen was captured by Matilda's supporters (Feb. 1141), Geoffrey deserted to her and was granted virtually viceregal powers in Essex. Before the rout of Matilda's force at Winchester (Sept. 1141), Stephen's queen brought Geoffrey back to the royalist side by more concessions, possibly including the viceregal powers in London, Middlesex and Hertfordshire which were formally granted to him by Stephen in Dec. 1141. Arrested at St. Albans for treason against Stephen in 1143, he gave up his offices and castles in return for his freedom and went off to plunder the fenland, using Ramsey abbey, which he fortified, as headquarters. It was here that his atrocities became a byword. Stephen besieged him in vain, but in Aug. 1144 he was mortally wounded by a chance shot while laying siege to Burwell, and he died at Mildenhall, Suffolk, on Sept. 16. As he had died unabsolved and excommunicate, his body, at first removed to the Old Temple in Holborn, was given Christian burial only in 1163, in the graveyard of the New Temple.

MANDEVILLE, SIR JOHN (fl. 1356), English writer of a fabulous travelers' guidebook, *The Voyage and Travels of Sir John Mandeville, Knight*, generally known as *Mandeville's Travels*. The first part is concerned with routes, and with wonders to be seen in Constantinople, Palestine and Egypt. The longer second part takes the reader "through many diverse lands . . . through Turkey, Armenia the little and the great; through Tartary, Persia, Syria, Arabia . . . through Lybia, Chaldea, and a great part of Ethiopia; through Amazonia, India the less and the more, a great part; and through many other Isles that be about India: where dwell many diverse folks, and of diverse manners and laws, and of diverse shapes of men." The lands described include not only Cathay (or China) but also the realm of Prester John (*q.v.*), the Land of Darkness, the Valley of Devils and the abode of the ten lost tribes of Israel imprisoned by Alexander the Great in the Caspian mountains.

During the Renaissance the author was famous as the greatest traveler of the middle ages, and also as the greatest liar. Whether he traveled at all is not certain, for he selected his materials almost entirely from the encyclopaedias and travel-books available to him. The first part follows the itinerary of William of Boldensele, a renegade German friar, who wrote in 1336. The second part follows that of Odoric of Pordenone, or Forlì Julii, who wrote his *Itinerarius* or *De Rebus Incognitis* about 1330. These itineraries Mandeville prunes of the trivial and the dull, enriching them instead with accounts of the history, customs, religions and legends of the regions traversed, culled from his remarkably wide

reading. A few details of names and distances in the first part may come from personal experience.

The tremendous popularity of this book about the wonders of strange lands caused many manuscript copies to be made (about 250 are extant), and many copyists tampered with the text. Wonders were added, numbers and unfamiliar names were misread, and reactions and translations multiplied. There are three French versions, two German, four English, four Latin, two Spanish, an Italian, a Dutch, a Danish, a Czech and a Gaelic translation. The earliest manuscript in English represents the author as saying that he wrote his book in three languages, Latin, French and English. This translation was made, however, from a slightly corrupt text which the translator followed blindly, making absurd blunders.

Authorship.—All that is known about Mandeville is that he states (in the Anglo-French current in England in the 14th century) that his name is "Johan Maundeville, chevalier," that he was born and educated in the town of St. Albans and that he began his travels on Michaelmas day (Sept. 29), 1322. Again, at the end of the book, he says that his name is "Johan Maundeville," that he set out in 1322 and passed through many lands and has now come home to rest, against his will, because of arthritic gout (*gouttes artetikes*), and for solace in his enforced rest he has compiled and put in writing the account of his travels, as he remembers them, in the year 1356, the 34th year after he set out. "Mandeville" was a common surname in 14th-century England, especially in Essex and around St. Albans. Several John Mandevilles are recorded, any one of whom may have been the author.

The tradition that Sir John Mandeville became a doctor, practised at Liège as Jean de Bourgogne, wrote his *Travels* there and was buried there, is entirely fictitious; but it persisted from the 14th to the mid-20th century and so its refutation forms a necessary part of any account of the real author. Study of the French manuscripts, their distribution and corruption, shows that the most consistent and least corrupt is the Anglo-French version, which was clearly written in England where most of the surviving copies of this text have been preserved. The earliest manuscript of this version, although not the author's holograph, is the best text because in it the many names, especially of places and people, are least corrupt; and the simple, direct, modest style of the author is clear and consistent. A redaction of this original into the French of Paris was made before 1371, when it was copied for the library of Charles V. This redaction adds a long passage to the account of the Valley of Devils, and for Mandeville's explanation of the seven climates it substitutes a paragraph on the antipodes which rephrases what the original had already said. Spelling and word order are altered in the direction of Parisian French, and there are differences in details, including a change in the date of writing from 1356 to 1357. Sometime before 1396 a copy of this Paris redaction came into the hands of Jean d'Outremeuse (1338-1400) of Liège, a writer of verse romances, of a lapidary, and of a fictionalized world chronicle, *Ly Myreur des Histors*. He used the *Travels* to create, in his *Myreur*, a series of eastern conquests for his favourite hero, Ogier le Danois (Ogier the Dane, *q.v.*). He also made a redaction of the *Travels* in the French of Liège, inserting into it a parallel set of references to the conquests of Ogier. He further enlarged his redaction by adding four "books": ii, of the shape of the earth; iii, of the heavens; iv, of herbs; and v, of the precious stones. Besides many lesser additions to the text of the *Travels*, this version has a passage added at the end which represents Mandeville as saying that on the way home he was ill in Liège where he was visited by a venerable physician, Master Jean de Bourgogne, called à la Barbe, who recognized him because they had met previously at the court of the sultan of Egypt. The doctor persuaded Mandeville to write the *Travels*. The most complete exemplar of this version is manuscript No. 699 in the Musée Condé at Chantilly. A copy lacking the four additional books was made at Liège in 1396. The story of the meeting of the doctor and Mandeville at Liège was given wide currency and the authority of a learned language by a Latin abbreviation of this Liège redaction, which dates the meeting in Liège as 1355.

Not content with this attempt to claim the *Travels* for Liège,

Jean d'Outremeuse, in the fourth book of his *Myreur des Histors*, asserts that Jean de Bourgogne was really Sir John Mandeville. In a passage preserved in an excerpt, he says that the doctor, Jean de Bourgogne, on his deathbed (1372), confessed that he was really Sir John Mandeville, knight, earl of Montfort in England, and lord of the isle of Campdi and of the château Pérouse; that he had had the misfortune to kill a count in England, and had engaged himself to travel through three parts of the world, arriving at Liège in 1343. He was buried in the church of the Guillemins.

The château Pérouse, near Rennes in Brittany, belonged to the French counts of Montfort about whom d'Outremeuse romances extensively, but no Mandeville was ever a count of Montfort. The "isle of Campdi" or "Comperdi" has not been definitely identified, but Jean de Bourgogne was a famous physician who owned property in Liège. In his *De Pestilentia* (1365) he states that he is a citizen of Liège and has practised medicine for 40 years. Since d'Outremeuse was a clerk and notary, he may well have been the executor of the doctor's estate and have written his epitaph. At any rate his story that Jean de Bourgogne was Sir John Mandeville was inscribed in stone in the church of the Guillemins. The stone has been destroyed but reports of several visitors to the church, in the 15th and 16th centuries, indicate that it combined what was known about the doctor with d'Outremeuse's fiction about Sir John Mandeville. Proof that this is fiction and not fact comes from examination of the manuscripts of the *Travels*. The Liège version is not the original text but the most corrupt of the three versions. Moreover, it was not made from the Anglo-French original but from the Paris redaction. It is therefore at two removes from the original. It is hardly possible to suppose that the Anglo-French text was written by a man who had been living at Liège for 30 years, or that it was written at Liège and yet was unknown there.

Spurious Works.—A lapidary in French was attributed to Sir John Mandeville in the 15th century. It is spurious and may be another fiction of d'Outremeuse, but it is not the same as the lapidary which he used to make book v of his version of the *Travels*. It does not correspond to any part of the huge *Trésorier de philosophie naturelle des pierres précieuses* compiled by d'Outremeuse and dated 1390. There are, however, in the *Trésorier* several quotations from a Latin lapidary which d'Outremeuse attributes to Sir John Mandeville. There also the author makes the claim that he has some precious stones which he bought from Sir John Mandeville. Other spurious works attributed to Mandeville in the 15th century include a life of St. Alban of Germany, a dedication to Edward III of England, a Latin letter purporting to be from the sultan of Egypt to the pope about the state of Christendom, all added to the *Travels* by Anglo-French copyists, and some medical and alchemical recipes probably attributed to Mandeville under the influence of the de Bourgogne legend.

Literary Genius and Reputation.—Mandeville was a literary genius who selected the best marvels from the narratives of genuine travelers and embellished them with additions from wide reading in the encyclopaedias, romances and legends of his day, transforming and vivifying them by his literary skill and genuine creative imagination. He wrote the first romance of travel in modern times.

He cast his materials in the mold of first person narrative and created for himself the character of a simple, honest, open-eyed observer who "would not have believed it if he had not seen it himself." He prefers natural explanations to miracles and gives a tone of modest matter-of-fact to the wildest tales, as when he says of the Fountain of Youth: "I have drunken thereof three or four times, and yet methinketh I fare the better." He knows how to select his materials to give sense impressions of taste, feel and smell. Like the later voyagers, he compares the strange with the familiar. He shows a sympathetic interest in strange peoples and attempts to understand their religious beliefs and customs. He is always tolerant, charitable and reasonable.

His explanation of the roundness of the earth and confident assertion that it could be sailed around, re-enforced by a story of a man who had actually done it twice, once in each direction, was known to Columbus and encouraged his companions. But in the age of exploration Mandeville lost his reputation as a truth-

ful traveler and gained one as the greatest liar. However, when printing began in England an abbreviated English version of the *Travels* became a popular book, later adopted by children and remaining in print throughout the 17th century and beyond. Eighteenth-century interest in the history of the English language produced an edition (1725, often reprinted), of the oldest English translation of the *Travels* to which Dr. Johnson gave high praise in his *Dictionary* (1755). Today the work is chiefly of linguistic, literary and antiquarian interest, although it remains a delightfully readable book.

BIBLIOGRAPHY.—J. W. Bennett, *The Rediscovery of Sir John Mandeville* (1954) classifies the manuscripts (c. 250) and 15th- and 16th-century editions, and also discusses authorship, the Liège legend, the literary quality and the history and influence of the *Travels*.

The first English translation was edited by Paul Hamelius from British Museum Manuscript Cotton Titus C. XVI, for the Early English Text Society, original series 153, 154, as *Mandeville's Travels* (1919). See also *The Cotton Manuscript in Modern Spelling*, ed. by A. W. Pollard (1905). A second English translation in British Museum Manuscript Egerton 1982, was edited for the Roxburghe Club (1889) by G. F. Warner, who also prints the best Anglo-Norman text, from British Museum Manuscripts Harley 4383 and Royal 20 B X. The popular English version from the edition of Thomas East (1568) with woodcuts was edited by J. Ashton (1887); see J. W. Bennett, "The Woodcut Illustrations in the English Editions of *Mandeville's Travels*," in *Papers of the Bibliographical Society of America*, 47, pp. 1-11 (1953). The Egerton text in modern spelling; the 1371 text of the Paris redaction; and the fourth translation into English, from Bodleian Manuscript Rawlinson D. 99, were edited by M. Letts for the Hakluyt Society, series II (1953). The Bodley Version of *Mandeville's Travels*, edited by M. C. Seymour for The Early English Text Society (1963) prints the text of Bodleian Manuscript E. Musaeo 116 with parallel extracts from the Latin text of British Museum Manuscript Royal 13 E. IX. This is a third and abridged English version, represented by two manuscripts. The Latin text from which it derives is here printed for the first time, and six manuscripts of it are described.

For sources see Albert Bovenschen, *Die Quellen für die Reisebeschreibung des Johann von Mandeville* (1888), and the editions of Warner and Hamelius. (J. W. Bz.)

MANDHATA, also called OMKARJI, a place of Shiva Hindu pilgrimage in the Nimar district of Madhya Pradesh, India, lies partly on the south bank of the Narmada river and partly on an island in the river. The Omarkar temple contains one of the 12 great lingas of Shiva; another stands outside the Gauri Somnath temple. All the temples on the island are Shivite, but there are Vaishnava and Jain temples on the north bank, and one of the few Brahman temples on the south.

Mandhata's annual fair was formerly the scene of the self-immolation of devotees who threw themselves from the high cliffs (Birkhala rocks) into the river. The last sacrifice occurred in 1824. (J. B.-P.)

MANDI, a town and district of Himachal Pradesh, India. The town, headquarters of the district, lies 45 mi. N.N.W. of Simla and 2,991 ft. above sea level on the Beas, a mountain torrent crossed by a fine iron bridge. Pop. (1961) 13,034. It is a centre for transfrontier trade with Tibet and Yarkand. Motorable roads link it with Simla and the Kulu valley.

MANDI DISTRICT, before 1948 a princely state, is intersected by two great parallel ranges, with an average height of 5,000 to 7,000 ft. above sea level. Pop. (1961) 384,259. Area 1,523 sq.mi. The valleys are fertile and produce all ordinary grains, besides more valuable crops of rice, maize (corn), sugar cane and tobacco. Rock salt is found, annual production of which is about 4,000 tons. (S. GL.)

MANDINGO (MANDINKA, MANDE), a group of Negro peoples of the Republic of Mali and adjacent parts of western Africa, who speak a language of the Mande-tan group. They are also known as Manding, Mandinga or Mali; Arab historians called them Wangara. They formed the nucleus of the former empire of Mali (see AFRICA: *History: Sahara and Sudan: Empires of Mali and Goa*).

The Mandingo are divided into three groups according to their different dialects: the Malinke (q.v., the Mandingo proper), who inhabit the upper reaches of the Niger, Senegal, Casamance and Gambia rivers; the Bambara (q.v.) who are found in places along the Niger around Bamako; the Diula (Dioula), who are a trading

people scattered in the southern regions. In the 1960s the groups numbered about 2,800,000, of which 1,500,000 were Malinke and 800,000–1,100,000 were Bambara. Linguistically the Mande-tan group also includes the Kasonke and the Soninke (Sarakole) in the north and the Koranko, the Kono and the Vai (*q.v.*) in the south. The Mande-fu group includes many tribes of Guinea, Sierra Leone and Ivory Coast (Susu, Mende, Kweni [*qq.v.*], Toma, Guerze, and Mano).

The Mandingo live mainly by cultivating millet, through burning and hoeing; cattle are used for sacrifices and in trade. Artisans (blacksmiths, potters, wood and leather workers) and *griots* (chroniclers and praisers) form separate castes which are little respected. Huts are usually round, with clay walls and straw roofs. An extended family, of paternal descent, occupies an enclosed area, under the leadership of the oldest member, villages and cantons having hereditary chiefs who are assisted by councils. Circumcision and excision are practised. Age groups and secret societies (Komo) extend throughout the whole society and "joking relationships" unite different groups. The Diula and a large number of the Malinke are Muslims. The pagans, in particular the Bambara, have a very rich cosmogony; feasts, the cult of the dead and divination are of great importance. By mid-20th century Islam had made considerable progress because of the splitting up of large families because of the monetary economy. MANDLA, a town and district of Madhya Pradesh, India. The town, formerly the capital of the Garh-Mandla Gond rajas and now the district headquarters, lies on the Narmada river, 45 mi. S.E. of Jabalpur. Pop. (1961) 19,416. The Rani Durgavati Mahavidyalaya (college) is affiliated to Saugar university. The town is notable for the manufacture of bell-metal vessels. It is the terminus of the branch railway line from Nainpur Junction (26 mi. S.W.), and main roads radiate in all directions.

MANDLA DISTRICT lies on the plateau of the central Satpura range. About 60% of the 1961 population of 684,503 were aboriginal tribes. The Narmada flows through the centre, receiving several tributaries which rise in the Maikal range, part of the great watershed between eastern and western India. The chief crops are wheat, rice and millet. The large forest area includes some sal forests and fine grazing land on the plateau. Big game is found in the Kanha National park. There is some export of food grains and oilseeds, and a larger export of timber and forest produce. The palace of the Gond rajas, built in 1633, is at Ramnagar, 10 mi. E. of Mandla town. (D. G. Na.)

MANDOLIN, a small stringed instrument, remotely derived from the lute (*q.v.*). The earlier "Milanese" mandolin was in effect a miniature, rather deep-bodied lute with either five or six courses of strings, played with a plectrum. It had the usual lute characteristics of a tension bridge glued to the flat table, the fingerboard flush with the front plane of the instrument and a violin-type pegbox and tuning pegs. The frets were fixed, however, and were either of ivory or metal.

The instrument as known and played in the 20th century owes its exact form and proportions to the maker Pasquale Vinaccia of Naples (1806–82). This "Neapolitan" mandolin has four pairs of steel strings tuned at violin pitch in fifths. The body is deeply vaulted and pear shaped. The fingerboard is slightly raised and is continued down from the neck to the border of the oval sound hole in the upper part of the belly, and carries 17 fixed metal frets. The table of the mandolin is reflexed downward at its widest part, forming an angle upon which the bridge is set. The strings pass over the bridge and are attached to a metal plate at the bottom of the instrument. Thus the cutaway table has the effect of increasing the pressure of the strings on the bridge, over which they pass at a marked angle, giving the instrument a brilliant soprano tone

BOOSEY & HAWKES LTD.

MODERN ROUND-BACKED NEAPOLITAN MANDOLIN

of great carrying power. Tuning is effected by a machine head.

A characteristic feature of the plectrum technique of the mandolin is the tremolo, obtained by the rapid oscillation of the plectrum across a unison pair of strings for the duration of the written note. In expert hands this has almost the effect of a sustained sound. The table usually has a tortoiseshell plate below the striking position to protect it from damage by the plectrum. (E. Ha.)

MANDRAKE (*Mandragora officinarum*), a plant of the potato family (Solanaceae) and a native of the Mediterranean region. It has a short stem bearing a tuft of ovate flowers, with a thick fleshy and often forked root. The flowers are solitary, with a purple, bell-shaped corolla; the fruit is a fleshy orange-coloured berry. The mandrake has been long known for its poisonous properties and supposed virtues. It acts as an emetic, purgative and narcotic, and was much esteemed in old times; but, except in Africa and the east, where it is used as a narcotic and antispasmodic, it has fallen into disrepute. In ancient

times it was used as a narcotic to diminish sensibility under surgical operations and was believed to have certain magical powers. Its forked root, depicted as resembling the human form, was thought to be in the power of dark earth spirits. The plant could be safely uprooted only by moonlight, after appropriate prayer and ritual, by means of a black dog attached to the mandrake by a cord. Human hands were not to come in contact with the plant's destructive properties. In medieval times it was thought that as the mandrake was pulled from the ground it uttered a shriek that killed or made mad those who did not block their ears against it. (Shakespeare alludes to this belief in *Romeo and Juliet*.) Once the plant was freed from the earth it could be used for beneficent purposes such as healing, inducing love, facilitating pregnancy and providing soothing sleep. Mandrakes are twice mentioned in the Old Testament (Gen. xxx, 14–16, S. of Sol. vii, 13) and thus received allegorical treatment from the Church Fathers and in the *Physiologus*.

The North American May apple (*q.v.*) is known also as mandrake.

See H. Rahner, *Greek Myths and Christian Mystery*, pp. 233–277 (1963).

MANDRILL, one of the most grotesque and colourful of old world monkeys, is usually grouped with the related drill in the genus *Mandrillus* (sometimes grouped with the baboons in the genus *Papio*). It inhabits the forested country of western Africa. The mandrill (*M. sphinx*) is characterized by a short tail; stout body; prominent brow ridges; small, deeply sunken eyes placed close together; and coloured patches of bare skin (most vivid in the male) on the face and buttocks. The ribbed cheek prominences

PAUL POPPER LTD.

MANDRILL (MANDRILLUS SPHINX)

are bright blue to violet, the bridge and end of the nose being scarlet. The buttock pads, pink to crimson, shading to bluish at the sides, vary in intensity of colour. The long fur of the body is olive to brown tending to grayish on the underparts, but the small, pointed beard on the face and the wisps of fur about the neck are light yellow; the eyes are framed in black. The adult male is heavily built, about three feet long including the tail stub; the female, duller in colour, is considerably smaller and lacks the pronounced snout and facial features of the male. Young males have black faces and sombre coloration.

Mandrills feed on fruit, roots, insects, small reptiles and amphibians. They travel in companies or troops that assert territorial rights. Old males, who may become ferocious, are capable of inflicting severe wounds with their inch-long canine teeth; they do not, however, make unprovoked attacks on man or other larger animals. See also BABOON; MONKEY; PRIMATES.

MANDSAUR (MANDASOR), a town and district in the Indore division of Madhya Pradesh, India. Pop. (1961) 41,876. The town, formerly in Gwalior state, lies on the bank of the Siwana river, 52 mi. N. of Ratlam on the Khandwa-Ajmer section of the Western railway. It is of considerable antiquity and of historical and archaeological interest. One of the inscriptions on two monolithic sandstone pillars at Sondni near the town refers to the erection of a temple of the sun in A.D. 437. Mandsaur fort was built by Ala ud-din Khilji in the 14th century. The town is situated in the opium-producing area of Madhya Pradesh, and has a sugar factory, a cotton-textile mill and an arts and science college affiliated to the Vikram university.

MANDSAUR DISTRICT (area 3,966 sq.mi.; pop. [1961] 752,085) lies on the Malwa plateau and, except for a range which runs east and west to the north of Neemuch (Nimach), consists of a rich level plain producing jowar (millet), cotton, oilseeds and poppy seeds. On the northern border of the district power generation began from the Gandhi Sagar dam and power station (included in the Chambal valley development project) in 1960. The district is administratively divided into eight *tehsils*. (S. M. A.)

MANDU (MANDOGARH), a ruined city in Dhar district, Madhya Pradesh, India, the ancient capital of the Muslim kingdom of Malwa. The city is 38 mi. S.W. of Indore city, at an elevation of 2,079 ft., and extends for 8 mi. along the crest of the Vindhya mountains. It reached its greatest splendour in the 15th century under Hoshang Shah (1405-34). The circuit of the battlemented wall is nearly 23 mi., enclosing a large number of palaces, mosques and other buildings. The oldest mosque dates from 1405; the finest is the Jami Masjid (1454), a notable example of Pathan architecture, founded by Hoshang Shah. The marble-domed tomb of this ruler is also magnificent.

MANDYA, a town and district of Mysore, India. The town, headquarters of the district, lies about 26 mi. N. of Mysore on the Chamara Nagar-Bangalore railway line. Pop. (1961) 27,275. The Mysore-Bangalore railway also passes through the town. About 10,000 ac. in and around the town are given to sugar-cane cultivation to supply the Mysore sugar factory (established 1932) which has an annual capacity of 24,000 tons of crystal sugar. Alcohol is manufactured from molasses. There is an intermediate college affiliated to Mysore university.

MANDYA DISTRICT (area 1,924 sq.mi.; pop. [1961] 899,210), largely a plain with isolated hills, is drained by the Cauvery (Kaveri) river and its tributaries. A major part of the district is irrigated from the Irwin, now Visweswariah, canal which draws water from the Cauvery near Krishnaraja Sagar dam. Pandavapura in the south has a sugar factory. Srirangapatan (Seringapatam) is of great historic significance, containing the mausoleum of Haider Ali and his son Tipu Sultan. (G. K. GH.)

MANES, the collective name in Latin for the spirits of the dead. It was probably a euphemistic title, meaning "good people." As the ancestral ghosts of a family were respected as minor gods, the inscription *dis manibus*, "[sacred] to the gods below," was frequently placed on Roman tombstones. But this formula had so little religious significance, as there was no serious public cult of the dead, that it was used even on graves of Christians.

See Pauly-Wissowa, *Realencyclopädie*, vol. xiii, col. 1051-60 (1928).

MANET, ÉDOUARD (1832-1883), one of the greatest French painters and engravers, and precursor of the Impressionists, was born in Paris, the son of a magistrate, on Jan. 23, 1832. He studied at the Collège Rollin (1844-48), where he met his future biographer, A. Proust. He is alleged to have already preferred to make drawings from nature than from casts and to have subscribed to the realist doctrine, *il faut être de son temps* ("one must be of one's own day and age"). After seeking entrance to the naval college, he joined the training ship "Guadeloupe," bound for Rio de Janeiro, returning to Le Havre in June 1849. From 1850 to 1856 Manet was a pupil in the studio of T. Couture, where he seems to have been only an intermittent visitor since he made several visits, during these years, to Fontainebleau in France, and to Italy, Austria, Germany, Belgium and Holland. It was in 1859 that he made his first submission to the Salon, a painting, "Buveur d'absinthe" ("Absinthe Drinker"), in which, according to Proust, concessions had been made to the formulas of Couture. It was rejected but in 1861 his entries ("Portrait of the Artist's Parents," related to the style of Gustave Courbet, and "Guitarrero") were accepted, earned an honourable mention and were well received by the critics. In 1862 Manet became a member of the Société des Aquafortistes and in the same year was praised by Charles Baudelaire. In 1863 Manet exhibited at the Galerie Martinet 14 pictures including his latest and most personal work "La Musique aux Tuileries" ("Music in the Tuileries"), (1862); in the same year the Salon des Refusés was opened to all artists who had been rejected at the official Salon, and included three pictures by him, chief among them being "Le déjeuner sur l'herbe" ("Picnic on the Grass"). Both of these exhibitions aroused considerable hostile criticism, but also succeeded in making of Manet a rallying point for the younger painters who were to form the nucleus of the Impressionists. Despite the obvious allusions to traditional themes in the latter painting, it was the realism (the painting of the events and appearances of contemporary life), together with the rejection of customary relationships of colour and tone, that inspired both the hostile criticism and the enthusiasm of the younger painters.

In 1865 Manet exhibited at the Salon "Christ Mocked by Soldiers" and "Olympia," painted in 1863, the latter evoking another storm of abuse. This key work in his development is one in which, having assimilated the lessons to be gleaned from Japanese woodcuts, his preoccupation with the formal qualities of painting is perhaps for the first time clearly evident. In August of the same year he visited Spain primarily to study Velázquez, and one of the earliest pictures executed on his return, "Le Fife" ("The Fife-Player," rejected at the Salon 1866), represents a combination of the renewed influence of Velázquez (the open atmospheric background), and the lessons of Japanese art (the simplification and intensification of colour and tone and the ornamental character of the silhouette).

On the occasion of the international exhibition in 1867, Manet organized his own exhibition, showing about 50 paintings, but these were hardly received any more favourably than before. During the later 1860s his work was varied in character, but in general it seems to represent a greater concern with close relations of tone, with complexities of illumination and atmosphere, and sometimes exhibits a freedom of handling comparable with that in "La Musique aux Tuileries." "The Execution of Maximilian," of 1867, and "The Folkestone Boat," of 1869, are representative of his work at this time.

During the Franco-German War of 1870 Manet served in the national guard under J. Meissonier, witnessing the siege of Paris and the Commune. In 1872, on a visit to Holland, he was impressed by the work of Frans Hals, and was much influenced by this artist when painting his "Bon Bock," which achieved considerable success when exhibited at the Salon of 1873.

At this time Manet was in intimate contact with all the members of the Impressionist group and during the course of 1874 spent some time at Argenteuil (near Paris) in the company of Monet and Renoir painting directly from the motif, a practice which he seems to have begun a few years earlier. An example of his work done at this time is "The Monet Family in Their Garden

PHOTOGRAPH BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

"ARTIST'S GARDEN AT VERSAILLES," BY ÉDOUARD MANET. IN THE PRIVATE COLLECTION OF MRS. JOHN BARRY RYAN

at Argenteuil." Despite his intimacy with the Impressionists, and their influence upon his work at this time, he refused to participate in their independent exhibitions and continued to send to the Salon. "The Railway" (Salon, 1874) and one Argenteuil picture (Salon, 1875) were both badly received while two were rejected in 1876. At this time critics readily underlined the connection between Manet and the Impressionists even though the character of the works shown did not really justify it. Manet continued to submit to the Salon with very little success until 1880 when his portrait of Proust was fairly well received, but it was not until the following year that he obtained a second-class medal and became thereby free to exhibit as he liked. In 1882 the important "Bar at the Folies-Bergère" was exhibited with some success and in the same year, partly through the machinations of Proust, Manet was nominated *chevalier* of the Legion of Honour. By this time, however, he was seriously ill and he died at Paris on April 30, 1883. In 1884 a large retrospective exhibition was organized at the École des Beaux Arts and it was after this memorial show and after the Manet sale of the same year that the price of his pictures began to rise.

Manet's importance is due first to his insistence upon drawing his subjects from the events and appearances of his own time and upon representing them in attitudes, shapes and relationships of tone and colour which he had seen and considered to be "natural," and secondly, to the importance given to the appearance of the picture as an arrangement of paint areas on a canvas over and above its function as representation.

See PAINTING; France: 19th Century; see also references under "Manet, Édouard" in the Index.

MANETHO (MANETHOS or MANETHON) (fl. c. 300 B.C.), an Egyptian priest born at Sebennytus (now Samannud) in the Nile delta, who wrote a history of Egypt in Greek, probably for Ptolemy I (305–282 B.C.). It has not survived except for some fragments of narrative in Josephus' treatise "Against Apion" and tables of dynasties, kings and lengths of reigns in the works of Julius Africanus, Eusebius and George Syncellus. Of these, Africanus' version is the most accurate and that of Syncellus the most complete, though his sources were not free from corruption. The fragments of Manetho's work thus preserved show that it was based on good native sources; these fragments have been of much service to scholars in confirming the succession of kings where the archaeological evidence is inconclusive, and Manetho's division of the rulers of Egypt into 30 dynasties is still accepted (see EGYPT:

History; CHRONOLOGY: Egyptian). He also wrote on Egyptian religion and with the Greek Timotheus he advised Ptolemy I on the new cult of Serapis.

See edition of fragments with Eng. trans. by W. G. Waddell in F. P. Robbins, *Ptolemy: Tetrabiblos*, "Loeb Series" (1956), and bibliographies to EGYPT and CHRONOLOGY. (R. O. F.)

MANFALUTI, AL- (MUSTAFA LUTFI AL-MANFALUTI, (1876–1924), Egyptian essayist and short-story writer and a pioneer of modern Arabic prose, was born in Cairo on Dec. 30, 1876, of a family claiming descent from Husain, grandson of the Prophet. He had the traditional Muslim education, including learning the entire Koran by heart, but he was fascinated by the new learning brought back from the universities of France. It is uncertain whether he learned French. More probably he engaged a translator, but what he read or heard he set to writing in Arabic in an easy flowing style, free from the then fashionable ornamentation of rhyming words, with a lustre not found in journalistic jargon. His collected essays (*Nazarat*, 3 vol., 1902–10; *Mukhtarat*, 1912) and short stories (*Abarat*, 1946), adapted or translated from French and other sources, opened a new chapter in Arabic prose to which may be traced the more accomplished examples of modern Arabic narrative. He died in Cairo on July 25, 1924.

(A. EL-T.)

MANFRED (1232–1266), king of Sicily, was the natural son of the Holy Roman emperor Frederick II by Bianca Lancia. Frederick, who died in 1250, by his will appointed Manfred vicar for Conrad IV in Italy and Sicily. When Conrad arrived in the Sicilian kingdom (Jan. 1252), Manfred had crushed a rebellion but had also negotiated with Pope Innocent IV with a view to gaining the Sicilian crown for himself. On Conrad's death in 1254, a diet at San Germano deoposed his son Conradin's representative, Berthold of Hohenburg, and elected Manfred instead. Excommunicated by the pope, Manfred at first submitted; then, having taken possession of Frederick's Saracen colony of Lucera, he headed a rising which led to the defeat of the papal army. Pope Alexander IV, however, after having excommunicated Manfred again, invested Edmund, son of Henry III of England, with the Sicilian kingdom in April 1255. A papal army entered the kingdom, but Manfred resisted successfully and, on rumours of Conradin's death, was crowned king of Sicily at Palermo on Aug. 10, 1258. As protector of the Italian Ghibellines, he asserted himself also in Lombardy and Tuscany; and he further strengthened his position by the betrothal, in 1260, of his daughter Constance to the infante Peter of Aragon. Negotiations with the new pope Urban IV, came to nothing; and Urban, considering Alexander IV's agreement with England void, offered the Sicilian crown to Charles of Anjou, who sailed for Rome in May 1265. Manfred, having failed to prevent Charles's army from joining him, was defeated near Benevento on Feb. 26, 1266; he fell in battle.

In internal government, Manfred continued his father's policy, though he could not maintain the same measure of centralization. He shared Frederick's interest in philosophy and science: he revised, and commented on, Frederick's book on falconry and translated, or had translated, the pseudo-Aristotelian *De pomis*.

MANFREDI, an Italian despotic family which during the later middle ages ruled the town of Faenza and also for a time the town of Imola. Their origin is to be sought among the landed gentry of 11th-century Faenza who subsequently formed the governing class of the early city commune. The Manfredi had risen by the 13th century to leadership of the Guelph faction in Faenza and by the early 14th century to effective leadership of the town, where from 1313 FRANCESCO MANFREDI (d. 1343) appears under the various titles of *capitano*, *podestà* and *dominus*. The lordship of the Manfredi, however, was neither uncontested nor continuous. In 1328 and 1368 they were dispossessed by the papal governors of Romagna; and, although Francesco's great-grandson Astorgio I (d. 1405) was invested with official power as papal vicar in 1379 and 1390, they were driven out again by the papal legate Baldes-

sare Cossa in 1405. Five years later Astorgio's son GIANGALEAZZO (d. 1417) recovered control of Faenza, which the family then continued to rule, despite domestic discord, for the rest of the 15th century. From 1439 to 1471 they also ruled Imola. The most distinguished in the politics and culture of his time was Giangaleazzo's grandson GALEOTTO DI ASTORGIO MANFREDI (1440–88), who patronized humanists and artists and formed a valuable library of books. He died a tragic victim to the jealousy of his wife, Francesca, and to the political ambition of her father, Giovanni II Bentivoglio, who together had him murdered on May 31, 1488. In the few remaining years of Manfredi domination Faenza passed increasingly under foreign influence. Galeotto's young son and heir ASTORGIO III (1485–1502) was thrown from power in 1501 by Cesare Borgia and murdered in Rome in 1502.

Fasoli, "Gli studi storici sulle signorie romagnole," *Atti della Deputazione di storia patria per l'Emilia e la Romagna* (1938–39); G. Donati, *La fine della Signoria dei Manfredi in Faenza* (1938). (P. J. J.)

MANFREDONIA, a town of the province of Foggia, region of Apulia, southeast Italy, is situated at the head of the Gulf of Manfredonia, 38 km. (23 mi.) N.E. of Foggia by road. Pop. (1961) 36,553 (commune). Sheltered by the Gargano peninsula to the northwest, Manfredonia has an equable climate. There are a municipal library and a museum housing many remains from nearby Siponto, especially coins and an important collection of funerary stele. Manfredonia is the terminus of a branch line from Foggia. The chief occupations are agriculture, fishery and commerce. The early 1960s saw the expansion of the tourist industry and the development of a hydraulic works. The Romanesque cathedral of Sta. Maria Maggiore di Siponto (1117) lies 3 km. (2 mi.) S.W. and marks the site of the ancient Sipontum, the harbour of Arpi, conquered by the Romans in 217 B.C. and the site of a Roman colony founded in 195 B.C. The site was abandoned in the 13th century because it had become unhealthy as a result of the proximity of stagnant lagoons. The inhabitants moved to Manfredonia, founded in 1263 by Manfred. Although the town was destroyed by the Turks in 1620, the castle and part of the walls remain.

MANGABEY, a name applied to slender west African monkeys of the genus *Cercocebus*, characterized by their bare, whitish upper eyelids, large cheek pouches and the uniformly coloured hairs of the fur. See MONKEY; PRIMATES.

MANGALORE, a seaport on the Malabar coast and headquarters of the South Kanara district, Mysore, India, lies on the backwaters formed by the Netravati and Gurpur rivers, 190 mi. W. of Bangalore. It is the terminus of the west coast line of the Southern railway. Pop. (1961) 142,669. The town has the appearance of being a continuous coconut plantation and presents a remarkable rural picture. It is an important centre of Roman Catholicism and a good percentage of the population are Christians. It is also an educational centre having four colleges, three of which are managed by the Catholics. The Government college and St. Aloysius college (founded by the Jesuits in 1880) are affiliated to Madras university.

Although ships have to anchor three miles out, Mangalore is a seaport with considerable trade, especially for the export of cashew nuts, coffee and sandalwood brought down from Mysore and Coorg, and paddy, areca nuts (betel nuts), coir yarn, fish and cardamoms produced locally. Cotton weaving and tile manufacturing were introduced into the region by members of the German Basel mission in the 19th century, and the town has become an important centre for the manufacture of roofing tiles. Other industries include brick kilns, coffee curing, pottery manufacture, coir weaving and cashew nut peeling. (G. KN.)

MANGAN, JAMES CLARENCE (1803–1849), Irish lyrical poet, was born in Dublin on May 1, 1803, the son of an unsuccessful grocer. At the age of 15 he became a copying clerk in a scrivener's office and remained one for ten years, after which he lived as best he could as a contributor to magazines, though posts were found for him for brief periods in the library of Trinity college, Dublin, and the ordnance survey office. His natural melancholy was aggravated by years of ill-paid drudgery and an acute disappointment in love. He became an opium addict and a

chronic drunkard, and the last years of his life were spent in extreme wretchedness. He died of cholera in Dublin on June 20, 1849. Two persons attended his funeral.

Many of his poems are translations from the Irish, from German and from eastern languages, often so free that Mangan is in effect using the original as a vehicle for his own emotions. Often also he described as translations poems that were in fact altogether his own. Much of his work has Irish history and legend for its theme, but in a few poems such as "The Nameless One" and "Twenty Golden Years Ago" he achieves an extraordinary modern note of personal realism and a tragic sincerity of tone.

MANGANESE, symbol Mn, a hard, brittle metal melting at 1,245° C. (2,273° F.), was first recognized as an element by the great Swedish chemist C. W. Scheele in 1774 while working with pyrolusite, the manganese dioxide ore, and was isolated by his associate, J. G. Gahn, in the same year.

The addition of manganese in the Bessemer steelmaking process, initiated in 1856 by Robert Mushet, made that process a practical success (see MANGANESE STEEL). In 1882 Robert Hadfield discovered the high-manganese steels which bear his name. The use of manganese is essential in steel manufacture for deoxidation and the control of sulfur content, and this application accounts for over 90% of the manganese consumed in all forms in the United States. Somewhat less than 13 lb. of manganese, chiefly in the form of ferromanganese, is used for each ton of steel produced, and no substitute exists for it.

Manganese is vital to plant and animal life and is essential to reproduction in animals. While it has been known and commonly used in both alloy and compound form for a long time, it was only introduced to industry in pure form with the development of the electrolytic process for its recovery in the late 1930s. Relatively impure metal, made by aluminothermic (see THERMITE) or silicothermic reduction of the oxides, had previously been available, but only with the advent of the very pure electrolytic product was precise and extensive work on the potentialities of manganese made possible. (C. A. HL.)

OCCURRENCE

Manganese is found only in the combined state in the earth's crust, in which it ranks 12th in order of abundance. Its distribution is widespread. There are, for instance, very few if any iron ores that are manganese-free, but, since the majority of iron ores have a manganese content of less than 5%, they are not primary sources of this element.

The type formula and approximate manganese content of the more common minerals are given below. Of those mentioned, easily the most important is pyrolusite (*q.v.*). Wad, of which one variety is "bog manganese," is not strictly a mineral but an earthy mixture of oxides with 3%–25% combined H₂O.

Pyrolusite	MnO ₂	63% Mn
Psilomelane	BaMnMn ₆ O ₁₆ (OH) ₄	45%–60% Mn
Wad	Hydrous Mn oxides	Variable
Manganite	Mn ₂ O ₃ ·H ₂ O (or MnO [OH])	62% Mn
Hausmannite	Mn ₃ O ₄	72% Mn
Braunite	3Mn ₂ O ₃ ·MnSiO ₃	62% Mn
Rhodochrosite	MnCO ₃	47% Mn
Rhodonite	MnSiO ₃	42% Mn

The major sources of ore supplies include the U.S.S.R., India, South Africa, Ghana, Morocco, the U.S. and Japan. Substantial quantities are also exported by Brazil, Cuba, Mexico and Egypt. On a smaller scale deposits are worked in Australia, China, Turkey and central Africa (Angola and the Republic of the [former Belgian] Congo). Western Europe is not completely dependent on imports from overseas, useful deposits existing in Italy, Sweden, Spain and Greece.

Reserves are known in Brazil and Morocco, while Indian production might be expanded if a market for lower grade ores came into being. When difficulties of geographical location and inadequacy of transport are overcome, ore bodies in Bolivia, Ecuador and Uruguay may be exploited.

Annual ore imports into the U.S. are about 2,000,000 tons despite production in several states, especially of rhodochrosite (*q.v.*), and the existence of very extensive low-grade deposits estimated to contain 75,000,000 tons of manganese. Under the direction of the U.S. bureau of mines, the American Iron and Steel institute and many private companies, a vigorous research program has been conducted in order to utilize these domestic reserves at least during periods of national emergency. Another potential source is slag from steel manufacture. On an average this yields 5%–10% manganese. Systematic investigation of the possibility of manganese recovery from such wastes has been pursued both in the U.S. and in Germany. Spiegeleisen, a pig iron containing 15%–30% manganese used in making steel, is produced from the residues left after the extraction of zinc from certain manganiferous zinc ores (see FRANKLINITE). (H. D. S.)

USES

Ferroalloys.—More than 95% of the manganese consumed is used in the form of ferroalloys by the metal industries, chiefly for steel manufacture. The predominant type, ferromanganese (78%–82% manganese, 12%–16% iron, 6%–8% carbon, 1% silicon), is made in blast furnaces and, to a lesser extent, in electric furnaces, by reduction of high-grade ores (48% or more manganese) with carbon. Low-carbon grades containing 0.07%–0.75% carbon are made by reduction of ores with ferrosilicon. Other types include spiegeleisen (15%–30% manganese, 6.5% carbon, 1%–3% silicon, balance iron) and silicomanganese (65%–70% manganese, 17%–20% silicon, 1.5% carbon, balance iron). These are used in steelmaking to a lesser extent than standard ferromanganese. In addition to their use in deoxidizing and desulfurizing steel, the ferroalloys are used in the preparation of manganese-containing alloy steels.

Pure Manganese.—The only source of pure manganese is the electrolytic process, and while the tonnage of metal produced is small compared with that used in the form of ferromanganese, it has grown steadily. Following the pioneering work done by S. M. Shelton and co-workers at the U.S. bureau of mines, production on a commercial scale was begun in the United States in 1941. Electrolytic manganese contains 99.9% manganese, and the greater portion, 60%–75%, goes into steel production as an alloying element and purifying agent, where it competes in cost with low-carbon ferromanganese. The balance is consumed in the preparation of nonferrous alloys of copper, aluminum, magnesium and the nickel-base alloys and of chemicals of high purity.

While methods in various plants differ in details, the electrolytic process uses a two-compartment diaphragm cell in which the anolyte contains manganous sulfate, ammonium sulfate and sulfuric acid to give a pH of about 1, and the catholyte is maintained at a pH of 7.2 to 7.6 in the presence of sulfur dioxide. The raw material is high-grade ore or high-manganese slag whose manganese content has been converted to manganous oxide, MnO, by roasting. This material is then leached with the anolyte from the cell, and the solution carefully purified to remove such impurities as iron, arsenic, antimony, tin, lead, nickel, cobalt, molybdenum, silica, aluminum, calcium and magnesium. The leach solution is returned to the cells as catholyte.

The compartmented cell operates with lead-base alloy anodes and stainless steel or Hastelloy C (trade name of Haynes Stellite Co. for alloy containing 14%–19% molybdenum, 4%–8% iron, 12%–16% chromium, 3%–5.5% tungsten, balance nickel) cathodes in the form of thin sheets. Manganese cathode deposits are removed periodically from these sheets by flexing and hammering and are recovered in the form of chips from $\frac{1}{16}$ to $\frac{1}{8}$ in. thick. An impure form of manganese metal, containing 95%–98% of the element, is made by the reduction of manganese oxide with aluminum or ferrosilicon.

Alloys.—Several alloys containing manganese are of commercial importance. One of the ferrous alloys is the iron-chromium-manganese stainless type, where manganese is substituted for nickel (see STAINLESS STEEL: *Austenitic Stainless Steels*). These contain 17%–19% chromium, 8%–10% manganese and about 0.1% carbon and have good structural strength and corrosion re-

sistance. Practically all commercial alloys of aluminum and magnesium contain manganese to improve corrosion resistance and mechanical properties. The presence of manganese in titanium improves the strength and workability of this light metal. An extremely high ability to damp vibrations is possessed by binary copper-manganese alloys. The development of alloys of manganese has expanded with the increasing availability of electrolytic manganese (see also ALLOYS).

Chemical Applications.—About 50,000 tons per year of high-grade natural manganese dioxide are used in the preparation of dry cells, or primary batteries, where the MnO₂ acts as a depolarizer to react with the hydrogen liberated by the cell reaction. A special crystal structure in addition to chemical purity is required for this purpose. A satisfactory grade is made by electrolysis of manganous sulfate in a sulfuric acid solution. This battery use is the most important nonmetallurgical application of manganese.

Manganese compounds are used in glassmaking to counteract the green colour from iron and for pink and black colouring. Organic compounds, such as the naphthenate, as well as oxides and salts of manganese, are used in paints and varnishes as driers to promote the absorption of oxygen, which causes paints to set. Manganous sulfate, MnSO₄, is used alone and admixed with fertilizers to supply trace quantities of this element in agriculture, especially for citrus crops, to stimulate growth and to combat chlorosis in crops grown in certain calcareous and highly organic soils. Manganous chloride, MnCl₂, is added in some cases directly to the electrolytic cells producing magnesium in order to add the desired quantity of manganese for the alloying of the magnesium. The powerful oxidizing properties of potassium permanganate are utilized for disinfecting, deodorizing and decolorizing, and this compound is an important analytical reagent.

CHEMICAL AND PHYSICAL PROPERTIES

Chemical Properties.—Manganese, whose atomic number is 25 and atomic weight 54.938, is located in group VIIa of the periodic table, horizontally between chromium and iron. Although somewhat similar to iron in general chemical activity, it can exist in its compounds in the valence states of 1, 2, 3, 4, 6 and 7, the most stable salts being those of the divalent form, and the most stable oxide, the dioxide MnO₂. The lower oxides, MnO and Mn₂O₃, are basic; the higher oxides, acidic. The most stable compounds are those of valence 2, 6 and 7, exemplified, respectively, by the manganous salts, such as MnCl₂, MnSO₄ and MnNO₃; the manganates, such as K₂MnO₄; and the permanganates, such as KMnO₄. Divalent manganese is a reducing agent, tetravalent manganese is a good oxidizing agent and heptavalent manganese is a powerful oxidizing agent. The trivalent and hexavalent forms undergo auto-oxidation and reduction in acid solutions:

These factors make manganese compounds useful for analytical procedures and for a variety of industrial applications.

Manganese metal oxidizes superficially in air and rusts in moist air. It burns in air or oxygen at elevated temperatures, like iron decomposes water slowly when cold and rapidly on heating, forming manganous hydroxide, Mn(OH)₂, with hydrogen evolution, and dissolves readily in dilute mineral acids, with hydrogen evolution and the formation of the corresponding divalent salts.

Fluorine, chlorine and bromine react with manganese when heated. At 1200° C. or over, nitrogen attacks the metal to form the nitride Mn₃N₂, and when heated with ammonia, manganese forms the nitride Mn₃N₂. Manganese reacts with sulfur.

Fused manganese dissolves carbon, as does iron, ultimately forming a carbide, and it reacts with carbon monoxide at temperatures above 330° C. and with carbon dioxide when strongly heated.

Because of its position in the electromotive series, the metal will displace arsenic, antimony, bismuth, tin, lead, copper, iron, nickel, cobalt, cadmium and zinc from solutions of salts of these elements. This property can be used to substitute manganese for zinc as a sacrificial electrode for cathodic protection and corrosion prevention in steel equipment. Boiling, concentrated solutions of potassium or sodium hydroxide have no action on manganese.

Physical Properties of Manganese

Atomic number	25
Atomic weight	54.938
Stable isotope	55
		Alpha	Beta	Gamma				Delta	
Density									
Solid, g./cc. at 20° C.		7.44	7.29	7.18					
Liquid, g./cc.			6.54						
Atomic volume, cc./gram-atom			7.4						
Melting point, °C.			1,244±3						
Boiling point, °C.			2,097						
Specific heat									
Cal./g. at 25° C. or B.T.U./lb. at 77° F.		0.114	0.154	0.148				0.191	
Linear coefficient of thermal expansion									
Per °C. (0°-100° C.)		22 × 10 ⁻⁶		14 × 10 ⁻⁶					
Per °F. (32°-212° F.)		12.2 × 10 ⁻⁶		7.8 × 10 ⁻⁶					
Electrical resistivity at 20° C., microhm-cm.		185	44	60					
Latent heat of fusion, cal./g.									63.7
Latent heat of vaporization, cal./g.									977.6
Magnetic susceptibility, 18° C. (cg. units)									9.9 × 10 ⁻⁶
Hardness, Mohs' scale									5.0
Heat of transformation, cal./gram-atom									
Alpha to beta, 727° C.									535
Beta to gamma, 1,100° C.									545
Gamma to delta, 1,138° C.									430
Standard electrode potential, Mn = Mn ²⁺ + 2e									+1.1 volts

Allotropic transition points

From	To	Temperature, °C.	Condition
Alpha	Beta	727±3	Heating
Beta	Alpha	700-665	Cooling
Beta	Gamma	1,079±3	Heating and cooling
Gamma	Delta	1,140±3	Heating and cooling
Delta	Liquid	1,244±3	Heating and cooling

Physical Properties.—Manganese exists in three, and possibly four, allotropic modifications, the alpha being the one stable at ordinary temperatures. Alpha and beta manganese are hard, brittle metals that will scratch glass. The pure metal cannot be fabricated. Gamma manganese, which changes to alpha at ordinary temperatures, is reported to be flexible and soft and can be bent and easily cut. The alpha form can be transformed to a ductile alloy by the addition of 2% copper and 1% nickel. The physical properties of manganese are listed in the accompanying table.

MANGANESE STEEL. In the middle of the 19th century, when Sir Henry Bessemer (*q.v.*) was developing his pneumatic process for converting pig iron into steel, his experiments almost failed. He found that when he used Swedish pig iron, made from high-purity ore and reduced with charcoal, he could produce a usable steel; however, when he tried English pig irons, with higher contents of sulfur and phosphorus, the steel he produced could not be hot-rolled or forged without breaking up. It was hot-short. Fortunately, contemporary experiments by Robert Mushet showed that manganese, added to steel containing sulfur, would prevent this hot-shortness, and steelmaking on a large scale thus became successful. (See **CONVERTER STEEL**.) Since that time, manganese has been the one most essential additive to steels (iron-carbon alloys). In the absence of manganese, the iron sulfide in the steel melts at about 985° C., or 1,805° F., forming an intergranular liquid at hot-rolling temperatures. Manganese converts the sulfur to manganese sulfide, which has a much higher melting point and which remains a plastic solid during hot-rolling or forging and thus cures hot-shortness. When not added for alloying effects the normal manganese content of steel is 0.3% to 0.7%. In resulfurized steels, where sulfur is added to improve machinability, manganese may be increased to 1.5% with a sulfur content of 0.35%.

The term manganese steel often connotes Hadfield's austenitic manganese steel, which contains about 1.25% carbon and from 12% to 14% manganese. The carbon and manganese contents are high enough to cause the transformation from the high-temperature form of iron, austenite, to the low-temperature form, ferrite, to be very sluggish. As a consequence, when this steel

is water quenched from a temperature of 1,000° C. (1,800° F.), it remains wholly austenitic at room temperature and is soft and ductile. The austenite is metastable, however, and when the steel is plastically deformed, as by cold working, it transforms rapidly to very hard martensite. (See **STEELS, ALLOY**.) Thus, for very rugged service, as in the rock crushers or railway frogs, it presents a hard, wear-resistant and self-renewing surface over a tough unbreakable core.

Manganese is fully the equivalent of nickel, chromium and molybdenum in promoting hardenability in steel, and it is cheaper. In low-alloy steels that are to be used in the normalized or hot-rolled condition, an increase in carbon will raise the strength, with a sacrifice in ductility, but an increase of manganese strengthens the steel, with no loss of ductility. Popular compositions contain 0.20% to 0.30% carbon and 1.25% to 1.75% manganese. Manganese is seldom used alone, however, because such steels tend to be coarse grained and notch sensitive. If not to be hardened, the grain size is usually refined with small additions of vanadium, titanium or aluminum. When they are to be hardened by water quenching, they often contain 0.2% molybdenum.

The so-called silicomanganese spring steel, containing 0.45% to 0.60% carbon, 1.8% to 2.2% silicon and 0.6% to 0.9% manganese, is really a silicon steel. Nondeforming steels for gauges, master tools, dies, etc., contain 0.80% to 0.90% carbon and 1.5% to 3% manganese and are characterized by their ability to maintain their shape and dimensions through a heat-treating cycle.

The high price and great scarcity of nickel and the production of carbon-free electrolytic manganese spurred the substitution of manganese for part of the nickel in austenitic stainless steels of the 18% chromium, 8% nickel type. Successful steels range from 16% chromium, 16% manganese, 1% nickel with 0.15% nitrogen to 18% chromium, 10% manganese, 4% nickel and 0.15% nitrogen, the latter being almost identical in properties with the 18% chromium, 8% nickel.

(C. E. Ss.)

MANGANITE, a basic manganese oxide mineral, MnO(OH), is an ore of manganese, ranking after pyrolusite and psilomelane (*qq.v.*), to which it readily alters. The colour of manganite is dark steel gray to iron black, and the lustre brilliant and submetallic. The streak is dark reddish-brown, the hardness 4, and the specific gravity 4.33. It is a low-temperature hydrothermal vein mineral, and is chemically similar to lepidocrocite FeO(OH) and boehmite AlO(OH), but has a different structure. Manganite crystallizes in the monoclinic system, but with an angle β of 90°, and hence appears as orthorhombic. The crystals are prismatic and deeply striated parallel to their length; they are often grouped in bundles and in columnar or fibrous masses. There is a perfect cleavage parallel to the side pinacoid. Manganite contains 80.6% MnO; it dissolves in hydrochloric acid with evolution of chlorine. Fine crystals are found at Ilfeld, Harz mountains, Ger., with calcite and barite. It also occurs in England, in Nova Scotia and in the United States, in the Lake Superior iron district. (L. S. RL.)

MANGBETU (MONBUTTU), a Negroid, Sudanic-speaking people of central Africa living to the south of the Azande (*q.v.*) in the Uele district of the Republic of the Congo (formerly the Belgian Congo), where they cultivate chiefly bananas and manioc. They were reported to number more than 1,000,000 in the 1960s. The name Mangbetu refers strictly only to the aristocracy, which in the 19th century established a number of powerful kingdoms, though in looser usage it denotes the whole amalgam of peoples whom they rule. They impressed early travelers with their political institutions and their arts, especially with their remarkable skill as builders, potters and sculptors. Contemporary Mangbetu continue to attract artistic interest with their exquisitely carved knives, wooden containers for honey, statues, musical instruments and jars. They became renowned also for their cannibalism and for their practice of deforming the heads of babies by binding them tightly so that they retained through life a curiously elongated form. The elongation is gracefully shown in a celebrated Mangbetu pottery jar formed as a female head. See also **AFRICA: Ethnography (Anthropology)**; **West Central Africa**; **AFRICAN**

MANGEL (MANGOLD, MANGEL-WURZEL) is a large type of beet belonging to the species *Beta vulgaris*, which also includes vegetable and sugar beets and Swiss chard. These types interbreed freely. The species probably originated from the wild beet *Beta maritima* and had its principal developmental centre in the eastern Mediterranean region. Mangold, the original name, is German and it has been somewhat modified in use. In France mangels are known as disettes. The mangel root is a store of food-stuffs in the forms of sugar and other carbohydrates. The sugar percentage is approximately 7%–8%, being about half that of sugar beets. The principal use of the crop is to provide a high tonnage of a succulent, nutritious feed for use in livestock, including poultry feeding. As feed for cattle and sheep, mangel roots are highly regarded and being very palatable they are often utilized as a relish for stimulating milk production. They are also considered valuable in conditioning animals for show purposes. Pound for pound the dry matter of mangels is equivalent in feed value to grain. The crop is usually grown in regions too cool or seasons too short for corn and where other conditions, such as soil fertility, soil type and moisture supply, are particularly favourable. Corn as compared with mangels will produce nearly double the yields of dry matter in the regions of its adaptation. Mangels are grown chiefly in northern and coastal western Europe and on the Pacific coast of the United States and Canada.

The plant is a biennial. During the first year of growth the stem remains short and a rosette of large, crisp, prominent-veined leaves arises from it. The upper portion of the primary root becomes large during midsummer and autumn, attaining a diameter of from 4–10 in. and a length of from 6–30 in. The shape of the root is a varietal characteristic. If it remains in place and survives the winter, or if it is properly stored, and transplanted the following spring, tall, angular, branching stems grow to heights of three feet or more and produce inconspicuous flowers and seeds. The flowers are perfect and arranged in dense, sessile clusters, each subtended by a small bract, along an axis. The seeds are embedded in the flower parts and usually several flowers clustered together give rise to the seed ball, from which several seedlings may develop. Five groups of varieties are recognized based upon root shape and colour and leaf colour. Shapes recognized are globular, flattened, cylindrical and fusiform while colours may be white, yellow, orange or red. Zonal coloration may also occur within the root.

Culture.—Like other root plants, the mangel is a row crop. The seed is drilled about 1½ in. deep in rows 24–36 in. apart at a rate of 10–15 lb. per acre. After emergence of the seedlings, cultivation is begun and continued until late summer. When the plants reach the four-leaved stage, they are spaced about 10–14 in. apart in the rows by thinning. Hand hoeing is then begun and the crop is weeded as required. Harvesting is done by mechanically lifting the roots previous to heavy frosts in the fall and removing the tops by cutting. The roots may be stored in large heaps or in covered pits or root cellars. Successful storage is dependent upon careful handling to avoid severe bruising, and also upon good ventilation. The roots may be pulled and fed directly as needed without topping.

The best soils for mangels are rich, well drained and in good cultivation. On more shallow land varieties with shorter roots may be grown. The crop responds markedly to heavy applications of barnyard manure and to potash, phosphate and nitrogen fertilizers. Although mangels are sometimes grown for several years on the same land, they more commonly occupy a place in rotation with grain and forage crops. Requiring careful cultivation and weed control, they leave the soil in excellent condition for succeeding crops.

The principal values of the mangel are its productiveness, yields usually being 20–45 tons per acre, and its succulence. Very few crops will produce as much succulent feed per area. Mangels re-

quire much hand labour in thinning, cultivating, harvesting and storage. In corn regions the cost of producing corn ensilage for succulent feed is much less than with mangels or other root crops. Mangels are more drought- and heat-tolerant but more sensitive to frost than are turnips or rutabagas, often grown for similar uses. Also, they are less affected by root maggots and aphids. Important objectives sought in better varieties are high yield of sugar and dry matter, freedom from disease and premature seed-stalk formation (bolting) and smooth, well-shaped roots of good keeping quality. (D. C. SH.)

MANGO, one of the most important and widely cultivated fruits of the tropical world. Its origin is lost in antiquity; according to some authorities, horticultural forms are derived from *Mangifera indica*, of the cashew family (Anacardiaceae), considered indigenous to the region of eastern India, Burma and Assam; but other species, such as *M. laurina*, may have entered into the composition of some, particularly those of the Malayan region.

History.—Few fruits are so inextricably connected with the folklore and religious ceremonies of India as the mango. Buddha himself was presented with a mango grove, that he might find repose in its grateful shade. The economic importance of the mango in ancient times is attested by one of the Sanskrit names, *am*, which has an alternative meaning of provisions or victuals. The Chinese traveler Hwen T'sang, who visited Hindustan between A.D. 632 and 645, was the first person, so far as known, to bring the mango to the attention of the outside world. Friar Jordanus wrote of it in 1328, and Giovanni de Marignolli in 1349. Akbar, the Mogul emperor who reigned at Delhi from 1556 to 1605, planted near Darbhanga the Lakh Bagh, an orchard of 100,000 mango trees. Nothing better attests the esteem in which the fruit has long been held than this immense planting, made at a time when large orchards of fruit trees were almost unknown.

The name mango, by which the fruit is known in English- and Spanish-speaking countries, is derived from the Tamil *man-hay* or *man-gay*, which the Portuguese adopted as *manga* when they settled in western India. Probably because of the difficulty in trans-

BY COURTESY OF U.S. DEPARTMENT OF AGRICULTURE

FLORIDA MANGO TREE IN FRUIT

porting seeds (they retain their viability a short time only), introduction of the tree into the western hemisphere did not take place until about 1700, when it was planted in Brazil; thence it reached the West Indies about 1740. It has taken on the appearance of a wild species in many parts of tropical America, trees springing up everywhere from seeds scattered by the roadside. During the ripening season, mangos are a major food-stuff wherever grown.

Description.—The tree is evergreen, often reaching large size (50–60 ft.) and attaining great age. It is one of the favourite shade trees of the tropics. The leaves are lanceolate, up to 12 in. long; the flowers, which are small, pinkish and fragrant, are borne in large terminal panicles. They are polygamous, i.e., some have both stamens and pistil, others stamens only. The fruit varies greatly in size and character, as would be expected of a species (or combination of species) that has been in cultivation for a long time. The smallest mangos are no larger than plums, while others may weigh four or even five pounds. The form is oval, round, heart-shaped, kidney-shaped or long and slender. Some varieties are beautifully coloured with shades of red and yellow, while others are dull green. The single large seed is flattened, the flesh that surrounds it yellow to orange in colour, juicy and of delicious spicy flavour. Fryer, writing of mangos in 1673, said "for Taste, the Nectarine, Peach and Apricot fall short." Hamilton, who wrote in 1727, went even further. "The Goa mango," he declared, "is reckoned the largest and most delicious to the taste of any in the world, and I may add, the wholesomest and best tasted of any Fruit in the World." There are ample grounds for considering the mango—as has been done by many writers—the "king of tropical fruits."

Most of the seedlings so abundant throughout the tropics do not represent this fruit at its best. While of good flavour, they are commonly characterized by coarse fibres throughout the flesh, which makes eating them disagreeable. In contrast, the fine grafted varieties that have originated in India and a few other regions, as well as seedlings of the race cultivated in the Philippines and other countries (known as Mangos de Manila in Mexico and Filipinos in Cuba), are almost devoid of fibre and are of excellent quality.

Distribution and Cultivation.—In 1889 the U.S. department of agriculture introduced into Florida the first of the grafted Indian varieties known in the United States—the variety Mulgoba, of superb quality but not highly productive. In subsequent years, mainly through the efforts of the Reasoner brothers and David Fairchild (*q.v.*), more than 50 other choice varieties were taken to the United States, whence the cultivation of several gradually spread to many parts of the American tropics. The British and French also introduced a number into the West Indies. Some of the best imported varieties are Pairi (known in Jamaica as Bombay), Borsha and Amini. In addition to these such varieties as Carabao from the Philippines and Saigon from Cambodia should be mentioned, as well as Julie, which first received horticultural attention in the French West Indies and later became popular in Jamaica.

Because of the failure of many varieties to produce regular and heavy crops of fruit, they have been replaced in commercial orchards by Haden (a seedling of Mulgoba that originated in Flor-

CLUSTER OF MANGOS

ida) and others that have been developed in that state.

Mango trees are injured by a few degrees of frost. They are grown commercially in southern Florida, but were not wholly successful in California, though numerous trees have fruited in that state. The mango is not particular as to soil, but the finer varieties yield good crops only where there is a well-marked dry season to stimulate fruit production rather than vegetative growth. There is another serious problem in rainy areas: a fungous disease known as anthracnose (*Colletotrichum*) which destroys the flowers and young fruits and is expensive to control.

Propagation is by means of grafting or budding. Inarching is widely practised in tropical Asia, but is tedious and relatively expensive. In Florida better methods have been developed and are used commercially. Chief among these are veneer grafting and chip budding. However, seedling trees of the Philippine race usually produce fruit like that of the parent and for this reason are extensively grown in Mexico. This race is polyembryonic, which means that trees usually do not develop from fertilized ovules, but from what are known as nucellar buds arising from the vegetative tissues surrounding the egg cell, hence they are in most respects similar to grafted plants. On the other hand, most of the Indian varieties are monoembryonic, which means that young plants develop only from fertilized ovules and therefore are subject to the variation that is characteristic of cultivated fruit trees in general.

Except with occasional dwarf varieties such as Julie, mangos in commercial plantings are spaced 35 to 45 ft. apart. The tree has a number of enemies, chief among which are the anthracnose disease mentioned above and certain scale insects (family Coccidae). In numerous tropical regions the fruits may be infested by the larvae of fruit flies (family Tephritidae), which render them unfit for human consumption and are difficult to combat.

See L. B. Singh, *The Mango* (1960); W. H. Chandler, *Evergreen Orchards*, 2nd ed., ch. 10 (1958). (W. Po.)

MANGOSTEEN, a beautiful, delicious fruit of tropical southeast Asia, produced by a handsome tree (*Garcinia mangostana*) of the family Guttiferae, which under favourable conditions reaches a height of about 35 ft. It has thick, dark-green, glossy leaves six to ten inches long; the flowers are large, polygamous; the fruits are about three inches in diameter, round to oblate in form, and dark purple in colour. They have thick hard rinds surrounding a large cavity in which lie several segments of snow-white flesh, resembling a mandarin orange; it is juicy, delicate in texture, and of delightful slightly tart flavour.

In spite of the fact that the mangosteen is so highly valued, and that its cultivation in such regions as Java, Sumatra, Indochina and the southern Philippines dates from very early times, the tree has nowhere been planted on an extensive scale, for mangosteens are difficult to ship very long distances. It was introduced into the western hemisphere in the 19th century, where it became established in several of the West Indian islands; it was later established on the mainland; e.g., in Guatemala, Honduras, Panama and Ecuador. It did not prove well adapted to the climates of California and Florida, but has been grown successfully in Hawaii.

For best results the mangosteen needs a rich deep soil and a moist tropical climate, but it will grow under less ideal conditions, though not where temperatures often go below about 40° F. Propagation is by seeds, which do not long retain their viability. Grafting has been unsuccessful and not required, since the embryos develop from tissues surrounding the ovary; hence, being of vegetative origin they produce trees that are as much alike as grafted ones. Occasional trees may yield more than 1,000 fruits; there is a tendency to produce good crops only in alternate years.

See W. H. Chandler, *Evergreen Orchards*, 2nd ed., ch. 13 (1958). (W. Po.)

MANGROVE, generally, the name for tropical and subtropical vegetation forming dense thickets or forests along tidal estuaries, in salt marshes and on muddy coasts and being composed chiefly of shrubs or small trees that produce prop roots. Specifically, the term is applied to the most prominent trees of these floras, species of *Rhizophora* and *Avicennia*. The western man-

RUTHERFORD PLATT

COMMON MANGROVE (*RHIZOPHORA MANGLE*) SHOWING THE TANGLED ROOT FORMATION

grove flora, along the eastern coast of tropical America and along the Gulf coast to Florida, consists chiefly of the common or red mangrove (*Rhizophora mangle*) of the family Rhizophoraceae, and the black mangrove (*Avicennia nitida* or *marina*) of the Verbenaceae. The eastern mangrove formations of India and the Malay archipelago include also members of other families, such as *Sonneratia* (Lythraceae) and the acaulescent *Nipa* palm (Palmae).

The trunks and branches of the common mangrove are typical of the growth habit of all mangroves. They constantly produce adventitious roots, which, descending in arched fashion, strike at some distance from the parent stem, and send up new trunks, the forest thus spreading like a banyan (*q.v.*) grove. An advantage in dispersal, very characteristic of the myrtle order to which all families mentioned here belong, is afforded by the seeds, which have a striking peculiarity of germination. While the fruit is still attached to the parent branch the long embryonic root emerges from the seed and grows rapidly downward. When the seed falls the young root is in the right position to be driven into the mud; the plant being thus rooted, the shoot makes its appearance. The young root may grow to such a length that it becomes fixed in the mud before the fruit separates from the parent tree. An interesting feature of the mangrove is the appearance of air roots, erect or knee branches of the roots, which project above the mud, and are provided with minute openings (lenticels), into which air diffuses; the air then passes through the soft spongy tissue to the roots beneath the mud. The wood of some species is hard and durable; the astringent bark yields a water-soluble tanning substance. The fruit of the common mangrove is sweet and wholesome.

MANHATTAN, a city of northeastern Kansas, U.S., the seat of Riley county, is located on the north fringe of the rolling Flint Hills, at the confluence of the Big Blue and Kansas (Kaw) rivers, 55 mi. W. of Topeka, and 10 mi. E. of Fort Riley, one of the state's beauty spots. The village was founded in 1854 when the settlements of Poleska and Canton were consolidated as Boston. It was renamed Manhattan in 1855 by mutual agreement between the Boston association and a party of colonists from Cincinnati. The city was incorporated in 1857 and adopted the commission-manager form of government in 1951. Manhattan, chiefly an educational centre, is the home of Kansas State University of Agriculture and Applied Science (formerly Blue-mont Central college, chartered 1858), one of the first land-grant colleges in the U.S. The city supports a municipal airport, a zoo, several large parks and a recreational program. It is 5 mi. from Tuttle Creek dam. Commercial and industrial activities include insurance, wholesaling, food processing, farm machinery, cut stone and truck farming. For comparative population fig-

ures see table in KANSAS: Population.

(A. B. SR.)

MANHATTAN, an island 14 mi. long and 2.3 mi. wide lying between the Hudson and East rivers in the southernmost part of New York state, U.S., is one of the five boroughs comprising New York city and also forms New York county. The borough of Manhattan includes, in addition to the island, a small area on the mainland known as Marble Hill and a number of small islands in the East river—Welfare, Governors, Randalls and Wards. Manhattan is the centre of much of the city's activities and is often mistaken as being synonymous with New York city.

The Dutch West India company founded Manhattan as a trading post and from the beginning finance was among its chief interests. In 1626 Peter Minuit, the first director-general of New Netherland province, is said to have purchased the island from the Brooklyn Indians (Canarsees) with trinkets and cloth valued at 60 guilders (then about \$24). The island became the possession of the English in 1664, having already been incorporated as the city of New Amsterdam in 1653. Renamed New York city, it played a prominent role in the early history of the republic, both militarily and politically. It served as the meeting place for congress from 1785 to 1790 and George Washington was inaugurated there in 1789 as the country's first president. In the 19th century, particularly following the opening of the Erie canal in 1825, Manhattan developed rapidly and became the heart of a prosperous and expanding metropolis. In 1898 greater New York was formed when Manhattan was joined with the newly created boroughs of Brooklyn, Queens, Richmond and the Bronx (*qq.v.*).

Manhattan is renowned for its many attractions and points of interest. Among these are Broadway, one of the best-known streets in the world; Wall street, focal point of the financial district; the skyscrapers, such as the Empire State building; Greenwich Village; Central park, extending from 59th to 110th street; the United Nations Headquarters building; and cultural and educational institutions, including the Metropolitan Museum of Art, Metropolitan Opera house, American Museum of Natural History, Hayden planetarium, Columbia university including Barnard college, Hunter college and City College, both operated by the College of the City of New York, and New York university. See also NEW YORK (CITY).

(D. L. D.)

MANI (MANES OF MANICHAÆUS) (215/216–274?), the Iranian founder of the Manichaean religion, was born in 215/216 in southern Babylonia, where his father, Patek, a native of Hamadan had joined a religious community practising baptism and abstinence. Through his mother Mani was related to the Parthian royal family (overthrown in 224). Information about his life appears to derive from his own writings and the traditions of his church. He grew up at his birthplace, speaking a form of eastern Aramaic. Twice, as a boy and young man, he saw in vision an angel, the "Twin," who, the second time, called him to preach a new religion. He traveled to India (probably Sind and Turan) and made converts. Favourably received on his return by the newly crowned Persian king, Shapur I, he was permitted to preach his religion in the Persian empire during that long reign. There is little information about Mani's life in those years. He probably traveled widely in the western parts of the empire, but later traditions that he visited the northeast seem unsound. Under the reign of Bahram I he was attacked by Zoroastrian priests and imprisoned by the king at Gundeshapur (Belapet), where he died after 26 days in captivity in 274 or 277. See also MANICHAËISM.

BIBLIOGRAPHY.—H. C. Puech, *Le Manichéisme* (1949), an account of Mani's life, with full references; for the disputed dates of Mani's life, see W. B. Henning with G. Haloun, "The Compendium of the Doctrines and Styles of the Teaching of Mani," in *Asia Major*, new series, III/1 (1952), and with S. H. Taqizadeh, "The Dates of Mani's Life," *Asia Major*, VI/1 (1957).

(MA. B.)

MANIA, a psychiatric term used to designate any abnormal or unusual state of excitement, as in manic phase of manic-depressive psychoses. Normal individuals may from time to time exhibit increased excitement and are said to be mildly manic (hypomanic); if there is an accompanying feeling of well being the state is called euphoria. In popular usage as a suffix, the word

has been the subject of much misunderstanding. Such popular terms as dipsomania, nymphomania and pyromania merely serve as labels for groups of symptoms that may be related to a variety of psychiatric disorders. See also *PSYCHOLOGY, ABNORMAL: Abnormalities of Behaviour*; *PSYCHOSES: Psychogenic Psychoses*; *EMOTION*.

MANICHAISM, a dualistic Gnostic religion first preached by Mani (q.v.) in the 3rd century A.D. Its early centre was Babylonia, then part of the Persian empire and a meeting place of faiths. Mani held that true religion had been taught by many prophets (among them Adam, Enoch, Buddha, Zoroaster, Jesus), but that all earlier religions were restricted in that they were local, taught in one language to one people; and that moreover each had been distorted in time by its adherents, who had lost sight of its original truth. He regarded himself as the "seal of the prophets," the last comer bringing a universal message; and by himself committing his teachings to writing he hoped to preserve them uncorrupted. He encouraged the translation of his writings into other languages and developed a missionary activity within his church which in time carried his teachings from the Atlantic to the Pacific, across the breadth of the ancient world.

History of the Manichaean Church.—Mani in his lifetime established his religion at many places in the Sasanian empire, sending missions within and beyond its borders, of which the following are specifically known: one to Egypt, between 244 and 261, led by Adda; one to Kirkuk (261–262), led by Adda and Abzakhya; and one to Margiana and Bactria, led by Ammo. The centre of the church was in Babylonia.

After Mani's death (274 or 277) the leadership of his church was disputed by Sisinnios and Gabriabos. The former triumphed, and led the community until his martyrdom in 291/292. His successor, Innaios, appears to have won tolerance for the Manichaeans, which lasted until new persecutions under Hormizd II. Little is known of the church in Persia during the remainder of Sasanian rule, except that it endured many bloody persecutions at the hands of the Zoroastrians, and that its main strength gradually became concentrated beyond the Oxus, across the northeastern Persian border. About A.D. 600 the trans-Oxian community claimed independence, under Shad-Ohrmizd, from the Babylonian Leader. Under the name of Denawars they preserved their autonomy until the early 8th century, when this administrative schism was healed, the rule of the Babylonian Leader Mihr (c. 710–740) being accepted in central Asia. Denawar literature survives in the Turfan fragments (see below).

Meantime, from the 3rd century onward Manichaeism had spread vigorously to the west, into the lands of the Roman empire. From Egypt it reached North Africa (where it was flourishing in the 4th century), and from Syria Asia Minor. It was known in Rome in the early 4th century, and spread to southern Gaul and Spain, where it probably attained its greatest extension in the 5th century. Christian persecution practically eradicated it from these lands in the course of the 6th century, but it survived in the eastern Mediterranean area until the 9th century, finally losing its identity in that of the so-called neo-Manichaean sects such as the Bogomils, Cathari (qq.v.) and Albigenses.

In the 7th century the Arab conquest of Persia and Iraq gave the Manichaean community there a brief respite from persecution, and some of the trans-Oxian community returned to their homelands. Under the Abbasids, however, cruel persecutions began again. Nevertheless, the community survived in Baghdad until the 10th century. It had sufficient vigour to maintain until c. 880 a schism which arose there in the early 8th century between the followers of Mihr and those of Miklas, concerning the community's way of life (no doctrinal disputes are recorded among Manichaeans). This dispute reached the central Asian communities. In the 10th century relentless Muslim persecution led to the seat of the Manichaean leader being transferred from Babylonia to Samarkand.

From early times the Sogdians of central Asia had been colonizing eastward, in small merchant communities, into what was to become East Turkistan. In 692 the Chinese reopened the great caravan routes, giving a new opportunity for Manichaean prose-

lytizing among these communities. A Manichaean missionary reached the Chinese court in 694, and in 732 an imperial edict permitted its foreign adherents resident in China to practise this religion. As in the west Manichaeism had been reproached with using a cloak of Christianity, so in the east it was regarded as presenting itself as a form of Buddhism.

When East Turkistan was conquered in the 8th century by the Uighur Turks, one of their kaghans adopted Manichaeism (in 763), and it remained the state religion of the Uighur kingdom until its overthrow by the Kirghiz in 840. It probably survived in East Turkistan until the Mongol invasion in the 13th century, maintaining itself most strongly in and around Khoco (Turfan), which remained a petty Uighur principality. In China it was forbidden in 843, but although persecuted it survived there at least till the 14th century.

Doctrine.—Mani taught a strict dualism, affecting spirit and matter. According to him, good and evil are essentially, and originally existentially, separate and opposed principles, which have become mixed in the world through the act of the evil principle. Salvation lies in the release of goodness and a return to the original state of separation. This basic teaching is set out in an elaborate mythology, harmonized from many different elements, formally marshaled in triads, pentads and dodecads, with complex correspondences.

The Myth.—In the beginning the kingdom of Goodness, or Light, stretched unbounded upward and to left and right (or northward and to east and west); below, or southward, stretched endlessly the kingdom of Darkness. The kingdom of Light is ruled by the Father of Greatness, whose being is expressed in terms of the five powers of understanding: *nous*, *ennoia*, *phronesis*, *enthymesis*, *logismos*. It is inhabited by countless Aeons and Aeons of Aeons, anthropomorphically represented. Twelve Aeons, his "First-born," surround the Father, three to each quarter of the heavens; and a female divinity, the Great Spirit, is, as it were, his consort.

The kingdom of Darkness was divided into five realms, each made up of one of the five dark elements (smoke, devouring fire, tempest, salt water [or poison], darkness). From them grew five Trees, and from the five Trees came the five species of devils: two-legged, four-legged, winged, swimming and crawling. Each species, ruled by a king, was divided into two sexes, and lived in perpetual lust and strife. The lord of hell, the Devil, combines in his own person features of all five kings: demon, lion, eagle, fish and dragon. He is regarded sometimes as the personification of Hyle, the *formatrix corporum*, the *Enthymesis* of Death; sometimes as her highest manifestation. In the realms of hell were found also the five metals and the five tastes.

Mixture of the Two Principles.—The Devil, coming by chance to the boundary between the two realms, saw, desired and invaded the Light. The Father of Greatness, to protect the eternal calm of the Aeons, met the attack through his own emanations, hypostases of his actions, who are the individual gods of Manichaeism, distinguished from one another mainly by their functions. The divinities of his First Creation, "evoked" by his word, are the Mother of Life, the First Man and the five Light Elements (ether, air, light, water, fire), which are also the "limbs" or substance of the Light World. The Light Elements are represented as the "sons" of the First Man, as his armour and as a bait which he throws the demons. They swallow it, are appeased and cease their invasion; but a part of Light is thereby absorbed in Darkness. This Light becomes smothered by the Matter which engulfs it, suffers and loses awareness of its own nature. Matter grows dependent on the swallowed Light, which it is necessary for it to retain.

The First Man is left unconscious on the battlefield, after he has cut the roots of the five Trees of hell, that evil may grow no more. Recovering awareness, he cries for help to the Father, who evokes the Second Creation of gods to his aid: the Friend of the Lights (whose function is obscure), the Great Builder and the Living Spirit with his five sons (Splenditenens, King of Honour, Adamas of Light, King of Glory, Atlas). The Living Spirit utters a Call to the First Man, whose Answer comes back from the depths.

Call and Answer are hypostasized as gods, the sixth "sons" of these two gods respectively; together they form the *Enthymesis* of Life, a power strengthening the unconscious yearning of the lost Light Elements for their own home. The Mother of Life and the Living Spirit then lead the First Man back to the Light. His rescue is a symbol for the salvation of the Lost Light, and for individual redemption.

Creation of the World.—The Living Spirit then overwhelms the devils. From the bodies of those slain he makes eight earths, from their skins ten skies. Others he fastens, living, in the firmament. From that portion of the swallowed Light still undefiled he makes sun and moon, and, from slightly maculate Light, the stars. For the redemption of the Light retained by Matter he creates the three Wheels of Fire, Water and Wind, controlled by the King of Glory. The Splenditenens holds up the ten heavens, Atlas supports the three upper earths.

Process of Redemption.—The Father of Greatness then evokes the chief god of his Third Creation, the Third Messenger. He evokes the Maiden of Light (who in this part of the myth also appears as the 12 Maidens), and the two divinities show themselves naked to the devils fettered in the sky. Beholding them, the males ejaculate, and with their seed there falls to earth the Light in their bodies. Part of the seed, falling into water, becomes a huge sea monster, defeated by the Adamas of Light. Part, falling on land, becomes the five kinds of trees and plants. The female devils, pregnant from unions in hell, miscarry, and their abortions fall to earth and people it with the five kinds of living creations.

The Great Builder makes the New Paradise or New Aeon (consubstantial with the kingdom of Light but existing separately from it until the last day) as a home for the gods and the redeemed Light. Its ruler is the First Man. The Third Messenger evokes the "Column of Glory, the Complete Man" who is both a god and the path whereby redeemed souls ascend to the moon (at the time of its waxing). Thence they pass to the sun and to the New Paradise. Sun and moon are set in motion by the Third Messenger, and with the change of seasons begins the physical redemption of Light (through dew, rain, etc.).

Creation of Man.—To defeat the process of redemption, Hyle prompts the demons Ashaqlon and Namrael to devour the offspring of the other abortions. Having thus increased the Light in their own bodies, the pair mate and produce Adam and Eve, in the form of the gods seen by the parent-devils in the sky. The Light in the demons' bodies is transmitted to the first human pair as the Soul. Imprisoned with the Soul in the demon-born body is the Dark Spirit, made up of lust, greed, hate, etc. Lust ensures that humanity propagates itself, and so makes an enduring prison for part of the Light in the world.

The god Jesus the Splendour (evoked by the Maiden of Light) awakes Adam to knowledge of the Soul's origin. Adam resolves on chastity; but Eve is seduced by a demon. By him she bears Cain and Abel, and later, by Adam, Seth. The human bondage of Light is thus carried on. This part of Light cannot be physically redeemed. Its salvation depends on conscious effort by each individual.

Individual Salvation.—The Great Nous, evocation of Jesus the Splendour, sends prophets to mankind, to bring gnosis to Adam's descendants. With knowledge comes the will to redemption; and through the five virtues of love (*agape*), faith, perfection, patience and wisdom, with which gnosis clothes the Soul, men are able to withstand evil. Hyle seeks always to overwhelm the Soul with forgetfulness. Religion strives to keep it aware and resolute. Using Pauline imagery, Mani called the unawakened Soul the Old Man and the awakened Soul the New Man.

Being of Light, the Soul can be guilty of the sins of the Dark Spirit and the body only in so far as it is unconscious or fails, through forgetfulness or weakness, to check them. Punishment follows automatically, in a postponing of the return to Paradise. The only atonement is contrition and a renewal of awareness and resolve. Only those Souls which reject the teachings of the Nous commit deadly sin. They deteriorate and in time may become assimilated to Matter and hence damned eternally.

Fate of the Individual Soul at Death.—There exist two symbolizations of the fate of the soul at death: the soul goes before the Just Justice (an evocation of the Nous), and having been judged takes one of three paths: to "Life" (New Paradise), to "Mixture" (back to the world, that is, to a period of reincarnation) or to "Death" (hell); or, the soul of the righteous man, leaving its body, is met by a redeeming god accompanied by three angels, bearing insignia of victory, which they bestow upon it. It then ascends to the New Paradise by the Column of Glory, moon and sun.

End of the World.—The end of the world will be foreshadowed by the Great War, followed by the second coming of Jesus, who will establish his judgment seat and separate righteous from sinners. He will then withdraw to the New Paradise. Thereafter the gods supporting the cosmos will abandon their tasks, and heavens and earths will collapse in the Great Fire, lasting 1,468 years, in which the last particles of Light will escape from matter, ascending to Paradise as the Last Man.

Hyle will be imprisoned, and the prison sealed with a great stone. Finally the New Paradise with all its inhabitants will be joined again to the World of Light.

Mani and Jesus.—Mani recognized three Jesuses. The redeeming god "Jesus the Splendour," an integral figure in his mythology; the "Jesus patibilis," also called the Living Self, that is, the Light suffering or "crucified" in matter; and "Jesus Christ," prophet and "son of God," who had, as divinity, taken on the appearance of man and had seemed to suffer death on earth. As prophet, Jesus was regarded by Mani as his own immediate forerunner. As god, Jesus was by Mani's docetic interpretation made one of the "saved Saviours" of Manichaeism, in which all the redeeming Gods, as emanations of the Father, are seeking to save themselves, in that they are consubstantial with the Light suffering on earth. Mani, with his abhorrence of matter, rigidly opposed the doctrine of Christ's incarnation. Mani considered himself the Paraclete, identifying the Holy Ghost with the Nous, inspirer and being of all prophets. In Buddhist lands Mani is represented as the Maitreya (*q.v.*).

The Community.—Strict virtue for the Manichaean necessarily involved a life withdrawn from the world, since he must in every way avoid injury to the imprisoned Light. The community was accordingly divided into the elect, who felt able to embrace a rigorous rule, and the hearers, who supported the elect by works and alms. The elect could expect to attain paradise at death; the hearers (with rare exceptions) could hope for salvation only after a period of reincarnation.

At the head of the community was its leader, Mani's successor. Under him there were five grades: 12 teachers, 72 bishops, 360 elders, the general body of the elect (to which women were admitted) and the hearers. The elect were "sealed" with the three seals of mouth and hands and breast. They were bound to chastity, poverty and abstinence from flesh and wine. They might possess food only for a day, clothing only for a year. They ate only one meal of vegetables a day, after nightfall; but since they might not harm the Light elements by plowing or reaping, kneading or baking, this meal was prepared by hearers. Monasteries existed, but since Manichaeism was a missionary faith the individual elect was required to travel much, on foot, preaching. He was enjoined to be gentle, joyful and to mingle sociably with the hearers.

The chief religious duty of the hearers was to care for the elect. They also took full part in the religious observances. Otherwise they lived in the world and were allowed to marry (monogamously), have children, drink wine and eat meat (although they might not themselves take life).

Cult.—The Manichaeans appear to have had no sacramental rites (since knowledge and virtue alone could win salvation). The essentials of their cult lay in prayers, the singing of hymns, fasting and confession. Seven daily prayers were enjoined on the elect, four on the hearers (midday, midafternoon, just after nightfall and three hours after sunset). Prayers, with prostrations, were uttered facing the sun or moon; in them were invoked the gods, the fourfold Manichaean unity of God, Light, Power and Wisdom. The many hymns which survive appear designed for

communal singing, often in antiphony. Some are formal, others express deep feeling. They are very varied, some short, some immensely long, forming elaborate cycles.

Fasting was enjoined on the hearers each Sunday, on the elect each Monday. In addition there were five two-day fasts observed through the year (the times being calculated from solar, lunar and zodiacal data). The fourth of these fasts was followed by 26 fast days (probably representing the days of Mani's suffering in prison), during which the hearers, like the elect, ate only once a day, after nightfall. On the next days fell the fifth two-day fast (probably commemorating Mani's death), and this was followed by the feast of the Bema, the chief event of the Manichaean year, commemorating Mani's ascension. This fell always in the spring.

There was confession each Monday, of the elect to one another and of the hearers to the elect; and annual confession by the community at the feast of the Bema. A surviving confessionary for the elect shows that in Manichaeism it was accepted that even the elect might sin and lose salvation.

Manichaean Scriptures.—The Manichaean canon consisted of seven works composed by Mani in his mother tongue, an eastern Aramaic dialect: the *Great (or Living) Gospel*; the *Treasure of Life*; the *Pragmateia* or *Treatise*; the *Secrets*; the *Book of the Giants*; the *Epistles*; and *Psalms and Prayers*. These books were held, in part at least, to be inspired by the spirit Mani called his "Twin." In addition there were the *Shabuhagan*, in which he summarized his teachings in Middle Persian for Shapur I; the *Ardahang*, Mani's drawing of the cosmos, with commentary; and the *Kephalaia*, discourses by the prophet posthumously collected, which contain some apocryphal matter.

With the extinction of Manichaeism in the middle ages these books disappeared; but they have been recovered in part in the 20th century. The two main places of discovery have been Turfan (Chinese Turkistan) and Egypt. In Turfan, remains of manuscripts were excavated from ruined Manichaean monasteries. They are in Iranian languages (Middle Persian, Parthian, Sogdian, Bactrian, New Persian), central Asian Turkish and Chinese, and survive in fragments only, mostly beautifully and precisely written, chiefly in the characteristic "Manichaean" script, akin to Estrangelo. They include pages from the above-mentioned works, among them some sheets of the *Shabuhagan* in the original Middle Persian; and a wealth of secondary religious literature: hymns and prayers, confessionals, homilies, moralized tales, bits of a church history, calendar tables, etc. The tales show that the Manichaeans played a part in transmitting fables from east to west. From the caves of Tun-huang (Chinese Turkistan) came a Manichaean treatise summarizing the faith in Chinese for the emperor (731).

In Egypt damaged papyri were dug up to the southwest of Fayyum. Written in Subakhmimic Coptic, they include the *Kephalaia* and *Epistles*, a hymnbook and a collection of homilies. Neither the Egyptian nor the central Asian material is fully published.

A Latin Manichaean text, earlier than A.D. 400, was discovered in a cave southwest of Tebessa, Algeria. It concerns the elect and hearers. These different finds have shown that Manichaeism preserved its doctrinal unity, despite the wide areas over which it spread.

Indirect Documentation.—Excerpts from the Manichaean scriptures have been transmitted by non-Manichaeans. Among the chief sources are the 4th-century *Acta Archelai* by Hegemonius (of which the part extant in the Greek original is quoted by Epiphanius); the Syriac *Book of Scholia* of Theodore bar Koni (8th century); and, in Arabic, the *Fihrist* of Ibn an Nadim (10th century) and the works of al-Biruni (11th century), Shahrastani (12th century) and al-Murtada (14th/15th centuries).

Manichaean doctrines have long been known from polemical works (including some of those just mentioned). Chief among these are the writings of the Latin Church Father Augustine (354-430), himself for nine years a Manichaean hearer. The most important Greek writings are those of Alexander of Lycopolis (fl. c. 300?), Titus of Bostra (d. c. 370) and the philosopher Simplicius (fl. early 6th century). In Pahlavi there is the 9th-century

Shkand-gumanig Wizar. Material is also supplied by the anti-Manichaean edicts of the Roman emperors, and two Greek formulas of abjuration for Manichaeans (6th and 9th centuries).

BIBLIOGRAPHY.—The chief general works are given by H. J. Polotsky in Pauly-Wissowa, *Real-Encyclopädie der klassischen Altertumswissenschaft*, supplementary vol. vi, pp. 240-271 (1935); by H. C. Puech, *Le Manichéisme, son fondateur, sa doctrine* (1949), which has full bibliographical notes; and by G. Widengren, *Mani and Manichaeism*, Eng. trans., rev. ed. (1965). For the chief publications of Turfan texts see the *Sitzungsberichte und Abhandlungen* of the Königlich Preussische Akademie der Wissenschaften (1902-45), followed by those of its successor, the Deutsche Akademie der Wissenschaften zu Berlin, and the bibliography given by M. Boyce in *A Catalogue of the Iranian Manuscripts in Manichaean Script in the German Turfan Collection* (1960). Egyptian texts have been published in the following works: H. J. Polotsky, *Manichäische Homilien* (1934); H. J. Polotsky and A. Böhlig, *Kephalaia*, vol. i (1940); A. Böhlig, "Aus den manichäischen 'Kephalaia des Lehrers,'" *Wissenschaftliche Zeitschrift der Martin-Luther-Universität Halle-Wittenberg*, vol. v (1956); C. R. C. Allberry, *A Manichaean Psalm-Book*, part 2 (1938). (MA. B.)

MANIFEST DESTINY, a persistent and cherished tradition of U.S. history which, in its broadest conception, declared that Americans are a chosen people, blessed with free institutions and ordained by God to create a model society in the wilderness. In this sense Manifest Destiny may be said to have begun with the Puritan landings at Massachusetts bay in 1630. In its more restricted geographical sense, the phrase refers to the desire of American expansionists in the 1840s to extend the boundaries of the United States to the Pacific ocean. Connecting the two periods is a host of utterances in the 18th and early 19th centuries by geographers like Jedidiah Morse and statesmen like Thomas Jefferson on American rights to a continental empire.

First joined together in July 1845 in a magazine article by John L. O'Sullivan, the words "manifest" and "destiny" provided a ringing slogan for newspaper editors and politicians advocating territorial expansion. O'Sullivan, a New York lawyer and journalist, used the phrase in his own paper, *The United States Magazine and Democratic Review*, to prophesy "the fulfillment of our manifest destiny to overspread the continent allotted by Providence for the free development of our yearly multiplying millions." In Dec. 1845, O'Sullivan invoked Manifest Destiny in the *New York Morning News* to support the annexation of Texas. Congressmen speedily picked up the phrase in their debates on the three major territorial questions confronting the United States in 1845 and 1846—the annexation of Texas, the joint occupation of the Oregon territory with England and the prosecution of war with Mexico.

In resolving these questions James K. Polk, who on March 4, 1845, took office as 11th president of the United States, played a decisive role. Unlike O'Sullivan, who conceived of Manifest Destiny in long-range philosophical terms, Polk reflected the militant spirit of the "War Hawks" from the northwest, who sought immediate acquisition of land. Polk swiftly approved the long-pending annexation of Texas, endorsed the division of Oregon at the 49th parallel, and engineered a war with Mexico in order to acquire the present states of New Mexico and California. Since Texas had freely offered to join the United States, and since the Oregon dispute was settled at the conference table, the Mexican War presented the issue of Manifest Destiny in its plainest form. Should the American people undertake an expansionist war on the basis of a tenuous claim that the Texas boundary extended to the Rio Grande? Should the victorious Americans acquire all of Mexico?

The first question was answered when the Democratic and Whig parties closed their bitterly divided ranks and swallowed their misgivings to support a war already initiated. Yet, when the American public faced the consequences of their victory, they backed away from the full implications of Manifest Destiny. Southern Democrats feared the inclusion of mixed races in the U.S. population. Northern Whigs opposed the addition of a vast southern area which could extend the slave-owning territory of the nation. When a compromise solution was proffered, through the offices of a special commissioner, Nicholas Trist, the president and congress eagerly approved it, and public clamour for all of Mexico

speedily died. The proponents of Manifest Destiny were satisfied with the sparsely populated northern third of Mexico, for which a substantial purchase price was paid. The Pacific had been reached, but the rule of another people had been avoided.

In subsequent periods the spirit of Manifest Destiny reasserted itself, notably in the cases of Cuba in 1854 and the Philippines in 1898. Again the American people drew back from policies that would lead to colonialism. Today it can be seen that Manifest Destiny erupted in the 1840s as a product of sudden technological changes—the steamboat, the telegraph, the railroad—which brought the continent within manageable compass. The new industrialism cried for more land and more markets. In sober retrospect, Americans have become aware that militant Manifest Destiny runs counter to, and not in defense of, freedom and democracy.

MANIFOLDS. A manifold in mathematics may be defined as a topological space equipped with a family of local co-ordinate systems that are related to each other by co-ordinate transformations belonging to a specified class. Manifolds occur in algebraic geometry, differential equations and classical dynamics. They are studied for their global properties by the methods of analysis and algebraic topology, and they form natural domains for the global analysis of differential equations, particularly equations that arise in the calculus of variations.

In the following account C^0 denotes the class of continuous functions, C^1 those with continuous derivatives, C^∞ those with derivatives of all orders and C^a those that are analytic. The discussion assumes some understanding of such topics as covered in ANALYSIS; ANALYSIS, COMPLEX; GEOMETRY; POINT SET; SET THEORY (THEORY OF AGGREGATES); SOLIDS, GEOMETRIC; TOPOLOGY, ALGEBRAIC; TOPOLOGY, GENERAL; GROUPS.

Let X be a topological space. An n -dimensional local co-ordinate system on X is a pair (U, θ) where U , called a co-ordinate patch, represents an open subset of X , and θ is a homeomorphic mapping of U onto an open subset of the real n -dimensional number space R^n . If P is a point of the patch U then $\theta(P)$ is an ordered set (x_1, \dots, x_n) of real numbers that are the co-ordinates of P in the local co-ordinate system (U, θ) . If (U', θ') is a local co-ordinate system assigning local co-ordinates y_1, \dots, y_n to the points of U' , then on the intersection of U and U' , if it is not empty, the y values are related to the x values by an invertible co-ordinate transformation $y_h = F_h(x_1, \dots, x_n)$ where $h = 1, \dots, n$. An n -dimensional manifold M_n of class C^i (where i is 0, 1, ∞ or a) is a topological space X together with a family of local co-ordinate systems with patches that form a covering of X and with co-ordinate transformations of class C^i ; that is, they are defined by functions of class C^i . The space X is called the underlying space of M and is denoted $|M|$. A C^i -manifold (that is, a manifold of class C^i) can equally be regarded as a C^j -manifold if j precedes i in the ordering $0 < 1 < \infty < a$. The space R^n with a single local co-ordinate system (R, θ) , where θ is the identity map of R onto itself, is the simplest example of an M_n of class C^a . A Euclidean n -sphere can be converted into an M_n of class C^a by means of two local co-ordinate systems, but not by one alone. Other examples of C^a -manifolds are: P_n (n -dimensional projective space) and $CP(n)$ (the complex projective space of complex dimension n); the real dimension of the latter, that is, the dimension as defined above, is $2n$. Manifolds of class C^0 , C^1 , C^∞ and C^a are also known respectively as topological, differentiable, smooth and analytic manifolds.

Let M, N be C^i -manifolds and f a mapping $|M| \rightarrow |N|$. In the neighbourhood of any given point of $|M|$, f can be represented in terms of local co-ordinates. The mapping f is of class C^i if each of its local representations is of class C^i ; this mapping is an isomorphism if it also admits a C^i -inverse $|N| \rightarrow |M|$. A mapping $|M| \rightarrow |N|$ of class C^i where $i > 0$ is regular if the Jacobian matrix of its local representations is of largest possible rank. M is a submanifold of N if $|M|$ is a subset of $|N|$ and the identity mapping $|M| \rightarrow |N|$ is a regular C^i -mapping.

From now on only those manifolds with underlying spaces that are separable Hausdorff spaces shall be considered. Such terms as connected, compact (or closed), noncompact (or open), when applied to manifolds, refer to their underlying spaces.

Isomorphism Classes.—The n -dimensional C^i -manifolds fall into equivalence classes, two manifolds being regarded as equivalent if they are isomorphic. Let I_n^i be the totality of these equivalence classes. Since an isomorphism between two C^i -manifolds can clearly be regarded as an isomorphism between two C^j -manifolds if $j < i$, there is a natural mapping $I_n^i \rightarrow I_n^j$ ($j < i$) induced by inclusion. For each n the natural mappings $I_n^i \rightarrow I_n^j$ are surjective; this means that each element in I_n^j has a pre-image in I_n^i . In fact, H. Whitney showed that if M is a differentiable manifold of dimension n , then its equivalence class contains an analytic manifold that is a submanifold of R^{2n} . It is also known that for $n = 0, 1, 2$ the mappings $I_n^i \rightarrow I_n^j$ are surjective. For small values of n the natural mappings $I_n^i \rightarrow I_n^j$ are injective (i.e., the images of distinct elements are distinct) but this is not true for every n . In fact J. Milnor constructed two nonisomorphic differentiable manifolds with underlying spaces that are homeomorphic so that they are isomorphic when regarded as topological manifolds. Certain cohomology invariants known as characteristic classes provide important tools for the analysis of equivalence.

A manifold can be triangulated if a homeomorphism can be established between $|M|$ and a simplicial complex; such a homeomorphism is called a triangulation. E. E. Moise showed that topological manifolds of dimension three or less can be triangulated. S. S. Cairns showed that all differentiable manifolds can be triangulated, and J. H. C. Whitehead showed that there exist triangulations under which the images of the simplexes are representable in local co-ordinates by C^1 -functions. The C^1 -triangulations of a given differentiable manifold bear a relation to each other known as combinatorial equivalence.

If equivalent manifolds are regarded as identical then there are just two connected 1-dimensional topological manifolds: the line and the circle. There are an uncountable number of open 2-dimensional topological manifolds and a countable number of closed. The latter are given by $S_0, S_1, S_2, \dots, S'_1, S'_2, \dots$ where S_p is a sphere with p handles and S'_p a sphere with p cross-caps (a cross-cap being a circular hole on the edge of which diametrically opposite points are regarded as identical). Little was known in the 1960s concerning the topological classification of manifolds of dimension greater than two.

Tangent Vectors and Differential Forms.—To each point P of a differentiable manifold of dimension n there is associated an n -dimensional real vector space T_P called the space of tangent vectors at P . This association is such that each local co-ordinate system (x_1, \dots, x_n) covering P determines a canonical base for T_P . Moreover, if (dx_1, \dots, dx_n) denotes the dual base for T_P , then two dual bases (dx_h) and (dy_h) are related by the Jacobian matrix at P of the corresponding co-ordinate transformation, consistent with the differential notation for the dual bases. Forming tensor products of T_P and T_P produces vector spaces with elements that are tensors at P . The totality of tangent vectors of a smooth manifold M can in a natural manner be given the structure of a smooth manifold of dimension $2n$ called the tangent bundle of M . Manifolds that occur in differential geometry have special structural features introduced through their tangent vector spaces or through the tangent vector spaces of their tangent bundles. In the Riemannian manifolds of differential geometry, for example, each tangent vector space carries a positive definite inner product.

Each system (x_1, \dots, x_n) of local co-ordinates determines a base $(dx_{i_1} \wedge \dots \wedge dx_{i_p})$ where $i_1 < \dots < i_p$ for the exterior algebra ΔT_P of T_P . A differential p -form on M is defined by assigning to each point P an element of ΔT_P of degree p . In a local co-ordinate system (x_h) a p -form has the representation $\sum a_{i_1, \dots, i_p} dx_{i_1} \wedge \dots \wedge dx_{i_p}$ where the a 's are functions of x_1, \dots, x_n . The exterior algebra $\Lambda(M)$ of a smooth manifold M is the totality of differential forms that have local representations with coefficients of class C^∞ . The exterior algebra ΛM admits a

natural endomorphism d , called exterior differentiation, that raises degrees one unit and satisfies $d^2 = 0$. The cohomology algebra $H^*(\Lambda(M))$ consists of the closed forms (those annihilated by d) taken modulo the exact forms (those that are images under d).

Homology and Cohomology.—The homology and cohomology groups of a connected n -dimensional manifold M have the following special properties: (1) The cohomology group $H^*(M)$ based on cochains with compact supports and values in a coefficient field F is either 1-dimensional or 0-dimensional (as a vector space); M is called orientable over F in the first case and nonorientable in the second. (2) If M is orientable over F , there exist isomorphisms $H^k(M) = H_{n-k}(M)$ known as Poincaré duality relations where $k = 0, 1, \dots$ and where $H_{n-k}(M)$ is the $(n-k)$ th homology group of M computed as the limit of the homology groups of the compact parts of M . The proof of (1) and (2) depends only on the fact that if P is any point of M , the cohomology groups of M "around P " (coefficients in F) are just what they would be if P were a point of R^n . A finite dimensional space having this property at each of its points was called by R. L. Wilder a generalized manifold over F .

If a manifold M is orientable over a field of characteristic other than 2, then its integral cohomology group H^n on compact supports is infinite cyclic and M becomes oriented when one of the two generators of H^n is chosen; the other generator determines the opposite orientation. A nonconnected manifold is oriented if each of its components is oriented. An isomorphism between two manifolds, one of which is oriented, determines a unique orientation for the other.

On any smooth manifold there exists a natural isomorphism between the cohomology algebra $H^*(M)$ over the real numbers, and the cohomology algebra $H^*(\Lambda(M))$ defined above (theorem of De Rham). The isomorphism holds equally well if both homologies are taken with compact supports.

The Cobordism Group.—Let M^1, M^2 be smooth oriented closed manifolds of dimension n . Let $-M^1$ be M^1 with orientation reversed. The expression $\epsilon_1 M^1 + \epsilon_2 M^2$ where $\epsilon_i = \pm 1$ is called a cobordism if there exist isomorphisms of M^1, M^2 with disjoint oriented submanifolds K^1, K^2 of an open oriented $(n+1)$ -dimensional manifold N such that $|K^1| \cup |K^2|$ is the topological boundary of some relatively compact component of $|N| - (|K^1| \cup |K^2|)$ and such that the orientations of $\epsilon_1 K^1, \epsilon_2 K^2$ are those induced by that of N . (Unique orientations will in fact be induced in these circumstances.) The cobordism group Ω is the quotient A/B where A is the free abelian group generated by the closed oriented manifolds and B is the subgroup generated by the cobordisms and the elements $(M \cup N) - M - N$. Let Ω^n be the subgroup of Ω defined by the manifolds of dimension n . R. Thom showed that the n -dimensional manifolds that are Cartesian products of complex projective spaces with even complex dimensions are linearly independent in Ω^n and that the rank of the subgroup they generate equals the rank of Ω^n .

Complex Manifolds.—In a complex analytic manifold of complex dimension n , the local co-ordinates are defined by mappings into C^n , the points of C^n being ordered sets of n complex numbers, and the corresponding co-ordinate transformations given by complex analytic functions. Such a manifold M can be regarded as a real analytic manifold of $2n$ dimensions and as such is always orientable. The exterior algebra $\Lambda_c(M)$ of complex valued differential forms of class C^∞ is considered on M (regarded as real). Each local complex co-ordinate system determines a canonical base $dz_1, \dots, dz_n, d\bar{z}_1, \dots, d\bar{z}_n$ for the forms of degree 1 where $d\bar{z}_i$ is the complex conjugate of dz_i . Then $\Lambda_c(M) = \Sigma \Lambda^{p,q}(M)$ where $\Lambda^{p,q}$ is generated by the forms $\bar{\omega}_p \wedge \omega_q$ where in each co-ordinate system ω_p and ω_q are homogeneous forms of degrees p and q in the dz 's and degree zero in the $d\bar{z}$'s. In certain types of complex analytic manifolds, notably the so-called compact manifolds of Kählerian type, of which the complex projective spaces are examples, the (p,q) -decomposition of Λ_c extends to its cohomology algebra: $H^* = \Sigma H^{p,q}$ where $H^* = H^*(\Lambda_c(M))$. On such a manifold M , the Poincaré duality relations take the form $B^{p,q} = B^{n-p, n-q}$ where n is the complex dimension of M and

$B^{p,q}$ the dimension of the vector space $H^{p,q}$ over the complex numbers.

MANIHIKI ISLANDS, a scattered archipelago forming part of the northern Cook Islands in the central Pacific ocean. It includes Suwarrow (Suvorov), Manihiki (Manahiki) or Humphrey, Rakahanga or Reirson, and Penrhyn or Tongareva. There is a good harbour at Penrhyn. Products include pearls, pearl shell and copra. The inhabitants are Polynesians. The islands were mostly discovered early in the 19th century and were annexed by Great Britain in 1888-89. They are administered by New Zealand. See COOK ISLANDS.

MANILA, the premier city of the Philippines in almost all respects. It is the chief port, the major trade centre, the leading manufacturing area and the focus of political and intellectual activity of the islands. Its northeastern suburb, Quezon City, is the official national capital but Manila handles many functions of government.

Manila has grown rapidly to a 1960 population of 1,145,723 (1948 census 983,906). About 80,000 Chinese, 4,000 U.S. citizens, 2,000 Spanish and a few hundred nationals from each of several other countries give the city an international aspect.

Geography and Topography.—Manila is about 1,500 mi. from Singapore and 1,400 mi. from Nagasaki. The city lies on the eastern shore of Manila bay (q.v.). To the north Mt. Arayat, a sacred mountain to the early Malays, is visible from the bay; to the west are the Mariveles mountains, and to the east the terrain rises to Laguna de Bay, a large lake from which the Pasig river issues to bisect the city. Various tidewater creeks find their way through Manila, connecting with the river or directly with the bay.

The modern Manila metropolitan area includes the chartered cities of Manila, Pasay City, Quezon City and 13 separate municipalities. Urban subdivisions reach out into Rizal province, overlapping a number of rural towns, villages and barrios in which truck gardening, poultry raising and a few rice fields still are found. Northeast of Manila is the suburb and national capital of Quezon City (q.v.) to which the University of the Philippines was moved. On the south is the smaller area of Pasay City.

Each of the 13 municipalities that serve as administrative centres for the political districts around Manila forms an older core of urban settlement around which new subdivisions in modern style were built. On the north, along the bay, lie Navotas and Malabon, with Caloocan inland. On the northeast, just beyond Quezon City, is San Mateo. To the east, south of Quezon City, are Marikina, San Juan del Monte and Mandaluyong. On the southeast lie San Pedro Makati, Pasig, Pateros and Tagig, and on the south, beyond Pasay City, are Parañaque and Las Pinas. Outward from the city core run main highways to the north, east and south; and thousands of persons who work daily in the urban area commute distances up to 20 mi.

Local names are applied to districts that are not formal political

units, such as Diliman district, where the University of the Philippines is located, Wack Wack, where a country club was established, and Santa Mesa, Grace Park, Rosario Heights and Balintawak, chiefly residential subdivisions.

As there are three Romes so there are three Manilas. There is the native Malay element indicated by pile-built houses of nipa palm thatch and bamboo thickly packed together along narrow streets and tidal creeks. There are the bits and pieces of Spanish medieval, reduced to remnants during World War II. Finally there is the Americanized modern element in the city (sometimes clearly of U.S. origin and sometimes a subtle blend of American, Malay and Spanish) indicated by public buildings, docks and warehouses, bridges, wide streets crammed with automobiles, the newer hotels, apartment houses, private houses built in contemporary U.S. styles, the country clubs and the airports.

The city of Manila proper is divided into 14 districts of unequal size, population and appearance. The most populous district is Tondo; north of the Pasig river and fronting the bay, it is still largely a native Malay zone. San Nicolás, Binondo, Santa Cruz, San Miguel and Quiapo, just north of the Pasig, are the heart of old Manila and of the business district, with Chinese stores, embroidery shops, banks, shipping offices, theatres and the Escolta—the famous business street—plus a tightly jammed residential zone.

Just out of the retail district, along the Pasig in San Miguel, is the Malacañan palace, formerly the residence of Spanish and U.S. governors and later the home of the Philippine president. To the east Sampaloc, the largest district and formerly a native residential area, gradually became largely a business section.

Four bridges cross the Pasig river within the main part of the city, offering access to the seven southern districts. On the bay front is the Port Area, a result of U.S. dredging of the harbour and construction of docks and warehouses. Although it was later dwarfed by a larger port district north of the Pasig, between San Nicolás, Tondo and the bay, most of the companies and govern-

ment offices dealing in shipping services remained in the Port Area.

Just inland from this is the old walled city of Spanish times, the Intramuros, with its 20-ft. walls stretching for two and one-half miles. About 1905 the old moat was filled and much of the space outside the wall was converted into gardens, playgrounds and a golf course. By the end of World War II only the church of St. Augustine was left intact within the Intramuros. South of the Port Area and the Intramuros lie Burnham Green, the Luneta and Wallace field, Manila's "common." Southward along the bay, Dewey boulevard and Taft avenue lead through the older residential zones, where many government bureaus, the general hospital and other institutions were established.

Ermita and Malate, the two districts involved, remained choice residential areas, and large houses and apartment houses were rebuilt there after World War II. Inland lie the chiefly middle-class residential areas of Paco, Pandacan and Santa Ana.

Climate.—The climate of Manila is similar to that of lowlands along the Philippine west coasts, having two pronounced seasons in rainfall but only mild seasonality in temperature. Weather is normally dry during January through April and rainy the rest of the year, particularly from June through October. July, normally the rainiest month, has high humidity and frequent thundershowers—24 rainy days as opposed to 3 rainy days in February. The annual total of 159 rainy days produces an average of 81.52 in., but annual variation is marked, ranging from 35.69 in. in 1885 to 154.35 in. in 1919. In temperature March through June is the warmest period, with May having a monthly mean of 28° C. (83° F.); November through February is the cooler period, January having a monthly mean of 24° (76°).

History.—The first European settlement at Manila was established by Miguel López de Legazpi in 1571. At that time a Mohammedan rajah (Lakandola) reigned over a native settlement within the district of Tondo. Manila became the capital and Legazpi the first governor of the Philippines. The islands were placed under the viceroy of New Spain in Mexico City, and official communication between the two widely separated areas was maintained by a galleon which plied annually between Acapulco and Manila. Trade of considerable proportions was developed.

Accompanying Legazpi to the islands was an Augustinian friar, Urdaneta, with others of that order, some of whom went on to Manila. In 1577 arrived Franciscans, who were followed by Dominicans, Jesuits and Augustinian Recollects. These orders founded convents, churches and schools and became very powerful in the government. In 1580 the first and only Roman Catholic bishop of Manila arrived in the person of Domingo de Salazar, a Dominican; but in 1595 the diocese was raised to a metropolitan see, and Ignacio Santibañez became the first of a long line of Spanish archbishops which ended with Nozaleda about 1900. In 1583 an *audiencia* (supreme court) was established. Abolished later, it was re-established in 1598 and continued as a Spanish institution for three centuries. The Spanish law was applied in those portions of the archipelago actually ruled by Spain; but the Spanish civil code came into force there only in 1889.

In the 17th century Spain warred with the Dutch and Moros, and Manila was menaced repeatedly. In 1762, the city was captured by British forces under Gen. William Draper and Adm. Samuel Cornish, who held it until 1764, the treaty of Paris (1763) having restored it to Spain. The 19th century was marked by some signs of progress. In 1825 Russell and Sturgis of Boston opened a branch of their Canton mercantile house—the first U.S. enterprise in the Philippines—and in 1837 the city was opened generally to foreign trade.

On the completion of the Suez canal a generation later, direct means of communication with Europe were provided and commerce accordingly was stimulated. The first Masonic lodge was founded at Cavite, near Manila, in 1856, and the Katipunan, a revolutionary society, borrowing some of its features from Masonry but never sanctioned by the Filipino nationalist leader José Rizal y Mercado, acquired a large following. The execution of Rizal on Dec. 30, 1896, was the signal for the outbreak of revolution, and the Spanish-American War brought Commodore George Dewey and his U.S. fleet, which destroyed the Spanish fleet at Cavite on May 1.

SAINT AUGUSTINE CHURCH, BUILT IN THE 16TH CENTURY, WAS THE ONLY CHURCH INSIDE INTRAMUROS NOT DESTROYED DURING WORLD WAR II

1898. Manila surrendered to the United States forces on Aug. 13, and for nearly 44 years the U.S. flag floated continuously over the city. The Japanese invasion in Dec. 1941 and Japanese occupation of the city on Jan. 2, 1942, was its fourth capture by a foreign power.

Liberation of greater Manila from Japanese control was accomplished by the end of Feb. 1945, and reconstruction began throughout the city, which had suffered greatly from war devastation. A significant change in the appearance of the city was brought about by its rapid industrialization. In order to accommodate the expanding population many private houses and older two-story constructions were replaced with apartment buildings. The historic Intramuros area was cleared of debris and a reconstruction scheme was proposed in the early 1960s. The rehabilitation program in Manila, as throughout the Philippines, was assisted by war damage payments by the U.S.; see PHILIPPINES, REPUBLIC OF THE.

(C. S. L.; J. E. SR.; R. E. HE.)

Educational and Religious Institutions.—Most of the early schools and churches in the islands were founded in Manila by religious orders. The Dominican order founded the University of Santo Tomas in 1619 and the Collegio de San Juan de Letran in 1640. As early as 1601 the Jesuit order founded the Collegio de San José, and in 1859, after the order returned to the islands, it established the Escuela Municipal, which later became the Ateneo de Manila. The Augustinians (the original order and the Augustinian Recollects) also have churches and convents.

The Protestant churches generally supported the public schools; a union theological school—Ellinwood seminary—was established for the training of Protestant ministers. The imposing Episcopal cathedral of St. Mary and St. John is located in Ermita, as is the Union (formerly Presbyterian) church.

There are a number of private technical schools, colleges and universities in greater Manila. Of these, the Far Eastern university was the largest in the second half of the 20th century. At the apex of the public school system are three national institutions, the Philippine Normal college, the Philippine College of Commerce and the University of the Philippines, in the Diliman district of Quezon City.

Administration.—Under Spain the city formed part of a province of the same name, which was abolished by the U.S. government after about three years of military rule. On July 31, 1901, by an act of the Philippine commission, Manila became the first of the Philippine chartered cities; other municipalities of the old province became part of the new province of Rizal. The so-called administrative code of 1917, amended in 1921, provided for a mayor appointed by the governor general (later by the commonwealth president) and confirmed by the senate, and a municipal board of ten members elected at large and serving for three years. Administrative departments were: engineering and public works, police, law, fire, finance, assessment, health and welfare.

On gaining independence in 1946, the Philippine government made the office of mayor in all chartered cities and municipalities elective, though the Philippine president exercised executive authority thereafter with regard to various of the chartered cities. There also are elective councils for each of the chartered cities. Because the national government's seat is in Manila and Quezon City, none of the cities and municipalities in greater Manila operates with complete autonomy; all are peculiarly subject to controls and influence from congress and the executive department.

Trade and Industry.—Greater Manila is by far the most important manufacturing center in the islands, having about one-half of the assets, one-quarter of the value of production, and one-third of the persons engaged in manufacturing in the country. Growth in and around Manila continued to be rapid after World War II. The highway around the circumference of the city was a particular focus of development during the late 1950s and 1960s. Manufacturing in the city includes textiles and clothing, food and beverage processing, fish canning, vegetable oil pressing, lumber veneer and plywood manufacture, production of chemicals and drugs, leather tanning and manufacturing, light metal fabrication and shipbuilding. Manila is the heart of most service facilities in the islands, the nerve centre of financial and political activity, and the

centre of educational and medical facilities. About one-half of all professional persons in the country live in greater Manila. See also references under "Manila" in the Index.

(J. E. SR.; R. E. HE.)

MANILA BAY, an almost completely landlocked bay extending into the Philippine island of Luzon from the South China sea. Its widest diameter from northwest to southeast measures 36 mi. and from Corregidor Island to the piers in Manila harbour is 30 mi. The bay has two entrances, one on either side of Corregidor (q.v.); the seldom used South channel is 6 mi. wide while the busy and safer North channel between Corregidor and Bataan peninsula is only 2 mi. wide. The north and northeast shore of Manila bay adjoins the central plain of Luzon. In this section the bay is shallow and lined by mud flats and mangrove; here are located the most extensive commercial fish ponds in the Philippines. The major part of the bay is between 30 and 120 ft. in depth; it has only a moderate tidal range and provides good to excellent anchorage. Manila harbour at the easternmost part of the bay is divided into two sections, North harbour for interisland ships and South harbour for international shipping; both have excellent docking facilities. Sangley Point, a U.S. naval reservation near Cavite city on the southeast shore, provides servicing for naval vessels. Bolanga on the western shore is home base for a small fishing fleet. In 1574 the Chinese pirate Lim-Ah-Hong sailed into Manila bay but was repulsed by Spanish forces. The bay was the western terminus of the Manila-Acapulco "galleon trade" between 1593 and 1815. The Spanish fleet was destroyed in the bay by a U.S. squadron under the command of Commodore George Dewey on May 1, 1898. During World War II many Philippine, American and Japanese ships were sunk at Manila, Cavite, Corregidor and several other locations by aerial bombardment. See WORLD WAR II: *The War in the Pacific*.

MANILA HEMP: see ABACÁ FIBRE.

MANILIUS, MARCUS (fl. early 1st century A.D.), Roman didactic poet, was the author of *Astronomica*, an unfinished poem on astronomy and astrology, of which five books remain. The poem consists of over 4,000 hexameters and was composed in the reigns of Augustus and Tiberius. To the reader unversed in astrological calculations the interest chiefly resides in the attractive prefaces to each book and the mythological or moralizing digressions. Manilius, writing as a Stoic, stresses the providential government of the world and the operation of divine reason. His style shows indebtedness to Lucretius, Virgil and Ovid. He abuses his unparalleled facility for versifying astronomical computations and habitually substitutes the complex for the simple. Rarely read *in toto* even by Latinists, he has been given unexpected publicity by the five brilliant volumes of A. E. Housman.

BIBLIOGRAPHY.—For text with an introduction, apparatus criticus, review of Manilian scholarship, full discussion of textual and paleographical problems, elucidation of difficulties, etc., see A. E. Housman, *M. Manilii Astronomicum*, 5 vol., 2nd ed. (1937). See also G. P. Gould, "De fonte codicum Manilianorum," *Rheinisches Museum*, vol. xcvi (1954).

(H. H. HY.)

MANIN, DANIELE (1804–1857), Venetian leader of the Italian Risorgimento, was born in Venice on May 13, 1804, the son of a converted Jewish lawyer who had taken the historic name of his sponsors' family at baptism. Daniele studied law at Padua until his strikingly early graduation in 1821 and then began to practise. This work absorbed his energies, and for some years he showed no great concern with public or patriotic issues, unless the discussion of possible routes for a railway between Milan and Venice can be counted as such. He disapproved of the conspiratorial activities of the extreme patriots and it was only after the election of Pope Pius IX in 1846 that it became clear that his views had changed. In association with Niccolò Tommaseo he then began to express the grievances of the Venetian people by whatever means were legally available to him. In Sept. 1847 he took part in a congress of Italian scientists which was the excuse for much political propaganda. After this he presented to the Congregation (the only quasi-representative body in the Austrian province) a petition for home rule. This was too much for the Austrian authorities, and Manin's first period of political activity ended with his and Tommaseo's imprisonment in Jan. 1848.

A popular rising on March 17, 1848, forced the Austrian governor to release Manin, and after a few days of uncertainty and another rising he was made president of the newly liberated republic (March 22). He announced the willingness of Venice to join a confederation of Italian states and then set to work to organize the defense of the republic against an Austrian recovery. In June the Austrians reoccupied the Venetian mainland, and on July 4 it was agreed that the republic should be fused with the kingdom of Sardinia-Piedmont in order to maintain the cause of Italian independence. Manin regretted the necessity of the decision, but accepted it. The defeat of the Piedmontese armies a month later meant the end of this fusion; and the Piedmontese commissioners who had come to Venice to negotiate the union were lucky to escape with their lives from a crowd enraged by the armistice. Manin now reassumed office (Aug. 11) virtually as dictator, but limited himself to proclaiming a provisional government without specifying the nature of the regime eventually to emerge. A heroic defense was maintained against siege by the Austrians; and hope revived once more when Sardinia-Piedmont re-entered the war in March 1849. Unhappily, the news of the defeat of Novara came almost at once. The siege was continued until August, but the combination of cholera and naval bombardment after the withdrawal of the Sardinian fleet from the Adriatic then made further resistance useless. The city capitulated on honourable terms (Aug. 22, 1849), and only Manin and a few others were excepted from amnesty. (See ITALIAN INDEPENDENCE, WARS OF; ITALY: History.)

Manin went into exile in France and his wife died almost as soon as he arrived in Marseilles. He went to Paris, where he suffered over the lingering death of a daughter. Neither this nor his penury kept him from politics. He strove to enlist French sympathy for Italy, helped to organize the Società Nazionale Italiana and urged the exiles to adopt the leadership of the house of Savoy. When Sardinia-Piedmont had entered the Crimean War, Manin made the famous pronouncement which expressed his conversion to the monarchist cause: "If you make Italy, I am with you; if you do not, I am not" (*Fate l'Italia e sono con voi; se no, no*). He died in Paris on Sept. 22, 1857; in 1868 his body was brought to Venice and buried there in state. Manin's political correspondence with Giorgio Pallavicino is edited by M. Maineri (1878); other documents were printed by M. Brunetti *et al.*, *Daniele Manin intimo* (1936).

See G. M. Trevelyan, *Manin and the Venetian Revolution of 1848* (1923); A. Levi, *La politica di Daniele Manin* (1933).

(J. M. Rs.)

MANING, FREDERICK EDWARD (1811–1883), New Zealand author and land court judge, was born on July 5, 1811, in County Dublin in Ireland. His family emigrated to Van Diemen's Land (Tasmania) in 1824, but Maning, attracted by the freedom of life in New Zealand, went to Hokianga in 1833 as a trader. Tall, strong, full of fight and good humour, he was successful with the Maoris, who needed such Europeans among them to bring in trade goods and muskets. Maning married the daughter of a Ngapuhi chief and paid a lavish £222 for 200 ac. of land at Onoke, Hokianga. He advised the Maoris against the treaty of Waitangi which established British sovereignty in 1840 but thereafter he accepted colonization as inevitable. At the Bay of Islands a Maori chief, Hone Heke, began a war against the British in 1845. At first he was successful against British regular troops, but in 1846 he was defeated, largely by Maoris under Waka Nene and Maning, who thoroughly enjoyed the fight. Although he had chosen to live among Maoris and knew them so well, Maning was often angry and disgusted with them and at the same time was very impatient of all officialdom. As a judge of the native land court from 1865 to 1876, he used his great knowledge of the Maoris' language, customs and traditions to serve them honestly, while berating them frequently with both humour and fury in private letters. Maning died in London on July 25, 1883.

He wrote *The History of the War in the North Against the Chief Heke* (1862), an account through Maori eyes, exposing the follies of both Europeans and Maoris; and *Old New Zealand* (1863), an ironical, semi-autobiographical account of the good old

days which has remained in print.

MANIOC, a native South American plant commonly called cassava (*q.v.*) and the raw product of its starchy tuberous root, from which tapioca is processed.

MANIPLE, a eucharistic vestment of the Roman Catholic Church, proper to all orders from the subdeacon upward, worn on the left forearm. See VESTMENTS, ECCLESIASTICAL.

MANIPUR, a Union territory and former feudatory state of northeast India, adjoins the frontier of Upper Burma. Area 8,628 sq.mi. Pop. (1961) 780,037. Its western districts project into Assam and are bounded on the north by Nagaland (*q.v.*) and the hills overlooking the Assam valley, on the west by Cachar district and on the south by the Lushai hills. The capital is Imphal (*q.v.*). The territory consists of the wide valley of the Manipur river, a tributary of the Chindwin, with an area of about 650 sq.mi., and a large surrounding tract of mountainous country. The valley is 2,500 ft. above sea level. The hill ranges generally run north and south, with occasional connecting spurs and ridges of lower elevation between. Their greatest altitude is in the north, where they reach to more than 8,000 ft. above sea level. The principal geographical feature in the valley is the reedy Loktak lake, more than 25 sq.mi. in area, but said to be gradually growing smaller. The Manipur river flows southward from the lake and turning eastward joins the Chindwin in Upper Burma. The territory is watered by many other rivers, the Barak in the west being the most important. The climate is temperate and rainfall in the valley is moderate. The hills are densely clothed with tree jungle and large forest timber. Elephants are found there, also tigers, leopards, rhinoceros and wild buffaloes.

Although their general facial characteristics are Mongolian, there is a great diversity of feature among the inhabitants of Manipur, some of them showing a regularity approaching the Aryan type. In the valley the people are chiefly Hindus, that religion being of recent introduction. Their own name for themselves is Meithei (*q.v.*), and their language is a branch of the Kuki-Chin family. One of their peculiarities is the high position enjoyed by women, who conduct most of the trade of the valley. The aboriginal hill-men belong to one of the two great divisions of Nagas (*q.v.*) and Kukis (see CHIN) and are subdivided into innumerable clans and sections. The Nagas are found mainly in the north and the Kukis in the south. About 60% of the population speak Manipuri, while rather less than one-fifth speak Naga and Kuki dialects respectively. Polo and hockey are favourite games of the people.

Manipur has virtually no history before 1762. Very little is known of its archaeology although ground stone hoes are reported to have been found there. The first relations of the British with Manipur date from 1762, when the raja solicited British aid to repel a Burmese invasion and a treaty was concluded. Little further communication took place until 1824 on the outbreak of the first Burmese War. British assistance was again invoked by the raja, and the Burmese were finally expelled from both the Assam and the Manipur valleys. Disputed successions became a continuous cause of trouble, and, in 1891 after a disturbance, Chura Chand, a five-year-old child of the ruling family, was nominated raja. During his minority the administration was conducted under British supervision. The opportunity was seized to abolish slavery and unpaid forced labour, to open up the state by roads and to introduce other reforms. In 1907 the government of the state was handed over to the raja and durbar, or council, with a member of the Indian civil service as vice-president. Subsequently the administration of the state was transferred to the raja from the durbar, of which the vice-president became president. After the Kuki rising in 1917 a new system of administration was adopted, three subdivisions being established, each under an officer lent by the Assam government. Manipur was invaded by the Japanese in World War II and was the scene of fierce fighting. After the accession of the state to India (Aug. 15, 1947) the political agency exercised by Assam was abolished; on Oct. 15, 1949, the administration was taken over by the Indian government and effected through a chief commissioner, with an elected territorial council.

The state is divided into two districts: Manipur Hills (pop.

(N. M. Ta.)

[1951] 175,368) and Manipur Plains (402,267). There are three colleges at Imphal affiliated to Gauhati university.

Agriculture and forest produce are the main sources of income. The soil is rich, and rice, sugar cane and pulses flourish. The state is noted for the excellence of its ponies. Several cottage industries are also well established, notably handloom weaving, and to a lesser degree soapmaking, carpentry and tanning. Communications in the whole state are poor. From Imphal there is a road northward to the North-Eastern railway at Manipur Road (Dimapur), Assam, and southeast to Tamu on the Burmese border.

BIBLIOGRAPHY.—*Manipur State Gazetteer* (1905); T. C. Hodson, *The Meithei* (1908), *The Naga Tribes of Manipur* (1911); L. R. Dayal, *Manipuri Dances* (1952). (F. R. A.)

MANIPURI, one of the major classical dance styles of India (see also **KATHAKALI**; **KATHAK**). Indigenous to the somewhat isolated territory of Manipur in northeastern India, Manipuri is quite dissimilar in style from the other classical dance arts of India, though it is based on the *Natya Shastra*. Dance in Manipur is communal and a part of religious life, being performed out-of-doors on numerous festivals. Themes are generally taken from episodes in the life of Krishna, the pastoral god. Dance dramas are interpreted during the action by a narrator who chants dialogue and descriptive action.

Long isolated in its native soil, Manipuri was made popular in India when, in 1917, the poet Rabindranath Tagore visited Sylhet. He saw demonstrations of the art and brought back teachers to serve in his University of the Arts in Santiniketan.

Manipuri is smooth and graceful, and technically easier and more limited than the other classic styles. Hand poses are used decoratively rather than as pantomime. Although bells are worn on the ankles, the movement of the dance does not accentuate their presence, the steps being light and close to the floor. It is the flowing sway of the body and the liquid quality of the arms and hands that give this dance style its beauty. Stronger and more primitive movements are used by men in the communal dances; sometimes the dancer plays a two-headed drum which is lashed to his waist. (R. M. Hs.)

MANISA, the chief town of Manisa il (province), Turkey, situated in the valley of the Gediz Nehri (Hermus river), at the foot of Manisa Dagi (Mt. Sipylus), and connected by railway with Izmir (Smyrna) and Afyonkarahisar. Pop. (1960) 59,675. Manisa is an important agricultural and commercial centre, and contains interesting buildings dating from the times of the Seljuk and early Osmanli sultans, including mosques built by Murad II and III and a Mevlevi *tekke* (Dervish convent) second only to that at Konya.

The area was inhabited in early times, as attested by the nearby ruins of the ancient Greek Magnesia ad Sipylum (see **MAGNESIA**). In 1204 Manisa was secured by John Ducas, who when he became emperor made it the Byzantine seat of government. In 1305, Roger de Flor besieged it unsuccessfully. In 1313 the town was taken by Saru Khan and became the capital of the Turkmen amirate of that name. In 1398 it submitted to the Osmanli sultan Bayazid I, and in 1402 was made a treasure city by Timur. In 1419 it was the scene of the insurrection of Bedr ed-Din, which was crushed by Murad II. In the 17th century Manisa became the residence of the greatest of the Dere Bey families, Kara Osman Oglu, which was Turkmen in origin, and was possibly connected with the amirs of Sarukhan.

The *liwa* of Sarukhan was one of the 22 districts in the Ottoman empire leased on a life tenure up to the time of Mahmud II. In the 18th century the Kara Osman Oglu (or Karaosman) ruled *de facto* all west central Anatolia, one member being lord of Bergama and another of Aydin, while the head of the house held Manisa with all the Hermus valley and had greater power in Smyrna than the representative of the kaptan pasha in whose province that city nominally lay. The last of its great beys was Haji Hussain Zade, who was frequently called into Smyrna on the petition of his friends, the European merchants, to assure tranquillity in the troublous times consequent on Napoleon's invasion of Egypt and the British and Russian attacks on the Porte early in the 19th century. He always acquitted himself well; but,

since he refused to bring his contingent to the grand vizier when on the march to Egypt in 1798 and aroused the resentment of the kaptan pasha, he was in continual danger. Exiled in 1812, he was subsequently restored to Manisa, and died there in 1821. His son succeeded after sanguinary tumults; but Mahmud II, who had long marked the family for destruction, was so hostile toward it after he had disposed of the janizaries that it had lost all but the shadow of power by 1830. Descendants survived in Manisa who retained a special right of granting title deeds within the district, independent of the local administration.

MANISA IL (area 5,315 sq.mi.) had a population of 657,104 in 1960. There are scattered mineral deposits (magnetite, mercury, zinc) and grapes, olives, tobacco, sesame and cotton are grown on the fertile plain of Gediz. (X.; N. Tu.; S. Er.; E. Tu.)

MANISTIQUE, city and seat of Schoolcraft county in the Upper Peninsula of Michigan, U.S., lies at the mouth of the Manistique river on the north shore of Lake Michigan about 40 mi. N.E. of Escanaba. It was incorporated as a village in 1885, chartered as a city in 1901, and adopted a city-manager form of local government in 1926. Manistique originated as a lumbering centre, and much of its pine went to help build many midwestern cities, including Chicago. Its natural harbour, kept relatively ice free by the swift current of the Manistique river, makes it an important commercial fishing port. Wood and paper products are among its principal manufactures. The area is rich in Indian folk-lore, and sites include the allegedly haunted Big Spring or Kitchitiki in the woods adjoining Indian lake (5 mi. W.), said to have been worshipped by the Chippewa tribe. (B. L. F.)

MANITO (MANITOU or MANITU), a term for supernatural power used by the Algonkian-speaking Indians of eastern North America. Generally it was attributed to various deities and nature spirits, who might become protectors or guardians as well as causing ill-fortune. In some tribes the manito was personified as the supreme deity, perhaps as a result of Christian teachings. (F. R. E.)

MANITOBA, a province of Canada, situated midway across the North American continent. Area 251,000 sq.mi., of which 39,225 sq.mi. are fresh water. Although known as one of the three "prairie" provinces (with Saskatchewan and Alberta), Manitoba possesses great diversity and only a small portion is treeless prairie. The remainder consists of parkland, forest interspersed with lakes, and subarctic tundra, and the province has 400 mi. of coast on Hudson bay. It is bounded by the U.S. on the south, Saskatchewan on the west, Mackenzie on the north, and Ontario on the east. The whole of the province falls within the central time zone. The capital is Winnipeg (q.v.).

Geology and Physiography.—The Pre-Cambrian shield (see map), covering three-fifths of the province, is made up of ancient rocks (gneisses, granites, etc.); it forms hilly broken ice-worn country with numerous lakes, and is drained northeast to Hudson bay by the Seal, Churchill and Nelson rivers. The Hudson bay lowland, the land sloping down from the shield to the sea, is built of horizontal Paleozoic limestones. The Manitoba lowland, southwest of the shield, is a basin that once held the great glacial lake known as Lake Agassiz. The several large lakes found in this lowland today are its remains and include some of the largest lakes in Canada: Lake Winnipeg (9,465 sq.mi.), Lake Winnipegosis (2,103 sq.mi.), Lake Manitoba (qq.v.) (1,817 sq.mi.), Cedar lake (537 sq.mi.) and Moose lake (525 sq.mi.). The Red river valley forms the southern part of the lowland and its fertile soils derive from the lacustrine clays deposited there by Lake Agassiz. The Manitoba escarpment (or cuesta) terminates the lowland on its southwest side; this feature has been broken up by rivers (of which the Assiniboine is the chief) into hilly areas known as the Porcupine, Duck and Riding mountains. The Saskatchewan plain, composed of Cretaceous shales with a covering of glacial boulder clays and lacustrine clays, extends westward from the escarpment into Saskatchewan.

Climate.—The climate is extreme or continental, with very cold winters and warm summers. In winter the temperature may fall to -40° F. (-40° C.) and below in all parts of the province. The average minimum in January is -13° F. (-25° C.) at Winnipeg

GENERALIZED GEOLOGIC STRUCTURE AND TOPOGRAPHY AND MAIN MINERAL DEPOSITS OF MANITOBA

and -27° at Churchill. The average maximum January temperature is 7° at Winnipeg and -11° at Churchill. Sudden changes of temperature of up to 40° may occur within 24 hours in winter. Spring is a brief season in which temperatures rise rapidly in May after the April thaw. June, on the average, is about 25° warmer than April.

Summer temperatures often exceed 90° F. (about 32° C.) and occasionally reach 100° in the south, but nights are relatively cool. The average minimum July temperature at Winnipeg is 55° , at Churchill 43° ; the average maximum July temperature is 79° at Winnipeg and 64° at Churchill. Violent electrical storms accompanied by heavy rain and often hail occur in summer. Autumn often has prolonged periods of dry sunny weather with mild days and frosty nights. Annual precipitation, occurring mostly in the summer months, ranges from 15 in. in the north and west to 20 in. in the south and east. Most of the province receives over 2,000 hours of sunshine a year.

Vegetation and Animal Life.—Except for a belt of barren tundra along the Hudson bay shore and a small area of prairie along the U.S. border in the south, the natural vegetation of Manitoba is forest. North of the prairie comes an open parkland with such trees as the aspen, Manitoba maple, elm and bur oak. This gives way to a mixed forest, where coniferous species are found along with deciduous trees. Next, beginning at the southern edge of the Canadian shield, comes the full development of northern coniferous forest with spruce, larch, pine and fir. This degenerates northward into subarctic forest where the trees become smaller and fewer until open tundra is reached.

The bison, antelope and elk, which flourished on the prairie before the white man came, have vanished. The principal prairie animals are gophers, badgers, coyotes and jack rabbits, and among

the birds are prairie chicken, grouse, gull, and mallard and black duck. In the forests, the black bear, moose, timber wolf, fox, otter, skunk, marten, mink and weasel may be found, along with such rodents as the squirrel and beaver. A variety of fish inhabit the lakes (see *Fishing*, below).

History.—Southern Manitoba was inhabited by Blackfoot, Sarcee, Assiniboin and Ojibwa (Chippewa) Indians, with Eskimos farther north along the shores of Hudson bay. The first European to enter the territory was probably Sir Thomas Button, who entered the Nelson river in 1612; seven years later two Danish ships wintered at the mouth of the Churchill. After its foundation in 1670, the Hudson's Bay company began to build forts in the area, the chief of which was York Factory at the mouth of the Nelson. From here, in 1691–92 Henry Kelsey explored parts of the province in the direction of the Saskatchewan river. In 1717 a wooden fort, Fort Prince of Wales, was built at the mouth of the Churchill; this was rebuilt in stone (1731–76).

Throughout the 18th century the area was affected by the Anglo-French feud. The Hudson bay region was recognized as British by the treaty of Utrecht in 1713, but the French entered Manitoba from the east. In 1731 La Vérendrye crossed southern Manitoba and in 1738 the French built Fort Rouge at the future site of Winnipeg. After the British conquest of Canada this rivalry was continued by the Hudson's Bay company, operating southward from York Factory, and the North West company of Montreal, the successor of the French fur traders. The routes from the north and the east met at "the Forks" or junction of the Red and Assiniboine rivers (Winnipeg). There the North West company built Fort Gibraltar (1804). It was in this disputed area that Lord Selkirk, in 1812, began the first agricultural settlement on the Red river (see *RED RIVER SETTLEMENT*). A struggle ensued in which the North West company destroyed the colony and the Hudson's Bay company destroyed Fort Gibraltar. Yet colonists still arrived, despite the harsh journey by way of Hudson bay. Numerous half-breeds (métis) swarmed around the colony and trading post. In 1821 the rival companies amalgamated and a new fort, Fort Garry was built, first of wood, but in 1836–39 of stone. The whole territory was then under the jurisdiction of the Hudson's Bay company.

In 1867 the Red river colonies became linked by steam navigation with the westward development of settlement and railways in the United States, and settlers began to pour into the region from the south; they came from eastern Canada, the British Isles and continental Europe. In 1869 the newly formed Dominion of Canada acquired the territory from the Hudson's Bay company and in the unsuccessful Riel rebellion of that year the métis took up arms against the new order. In 1870 the province of Manitoba was set up and entered the federation. The town of Winnipeg grew rapidly around Fort Garry after 1870 and was linked by rail with the U.S. in 1878 and with eastern Canada in 1881. Immigrants came in still larger numbers by rail to Winnipeg and spread over the province to the west, breaking up the virgin land; wheat flowed eastward in increasing quantities. To provide an additional outlet for this growing agricultural production, a railway to Hudson bay was begun in 1910, but work had to be abandoned with the outbreak of World War I; it was resumed again in 1926 and completed to the port of Churchill in 1929. The population of Manitoba, which was 25,000 in 1871, had passed 250,000 by 1901 and reached 700,000 in 1931. The boundaries of the province were extended in 1881 and again in 1912.

The 1930s were years of depression and drought. After World War II there was a greater diversification of agriculture, increased industrial expansion and mining activity.

Government and Public Finance.—The constitution of the province is derived from the British North America acts of the imperial parliament (1867 and 1871); the Manitoba act of the Canadian parliament (1870); such laws and institutions of the Northwest Territory as have not been abolished or amended; and British common law and constitutional conventions. Power is divided between the federal government at Ottawa and the provincial government seated in Winnipeg, the capital. The crown is represented in the province by the lieutenant governor. The provincial premier and his ministers are normally selected from the largest party in

Harvesting wheat near Portage la Prairie. Grown chiefly in the southern part of the province, wheat is Manitoba's most important field crop

Commercial fishermen netting a catch from one of Manitoba's many lakes. Only Ontario outranks Manitoba in the development and value of its inland fisheries

Oil derrick in the plains region of southwestern Manitoba. Although not commercially produced there until after World War II, petroleum became one of the most important minerals of the province

Highway through the forest region of northern Manitoba. Only small sections in the east have been cut over for paper and pulp. The remainder is virgin timber, and the area is largely unpopulated

TRANSPORTATION AND INDUSTRY

BY COURTESY OF (TOP LEFT) MANITOBA TRAVEL AND PUBLICITY BUREAU, (TOP RIGHT, BOTTOM) PROVINCE OF MANITOBA, DEPARTMENT OF INDUSTRY AND COMMERCE, (CENTRE RIGHT) CANADIAN CONSULATE GENERAL, CHICAGO; PHOTOGRAPH, (CENTRE LEFT) KARSH OF OTTAWA FROM PUBLIX

the single-chamber legislature, which consists of 57 members and is elected for a maximum period of five years. Local government is under provincial control. There are 6 incorporated cities, 35 towns, 37 villages and 112 rural municipalities which vary greatly in size and which are divided into land units called townships (each 36 miles square). There are 14 local government districts in newly developed areas which before 1945 had no organization. There are no counties but 16 census divisions. Manitoba is represented in the federal parliament at Ottawa by 6 senators and 14 members of the house of commons. Annual revenue of about \$100,000,000 is derived from corporate income taxes (44%), gasoline tax (17%), liquor control (13%), licences (8%) and mining (5%). Major expenditures are for highways (34%), education (22%), health and public welfare (18%).

Population.—With a population of 850,040 in 1956, and 921,686 in 1961, Manitoba was sixth among the Canadian provinces. The rate of growth was very slow during the economically difficult period from 1931 to 1946, when immigration almost ceased and there was much migration from the province. After 1946 the increase was marked; it amounted to 123,117 in the intercensal period 1946–56, compared with 26,784 in the preceding 15 years. Urban population increased rapidly while rural inhabitants became less numerous; between 1941 and 1951 the urban population increased from 49% to 56%, and in 1961 more than one-half the population lived in greater Winnipeg. The chief towns of the province are Winnipeg (*q.v.*), St. Boniface (*q.v.*), St. James, Brandon (*q.v.*), East Kildonan, Portage la Prairie, Transcona and Flin Flon. All except Brandon, Flin Flon and Portage form part of greater Winnipeg (pop. [1961] 475,989).

Incorporated Places of 5,000 or More Population (1961 census)

*Previously known as East Kildonan Municipality.

†Previously known as St. James Municipality.

‡Previously known as West Kildonan Municipality.

Note: Populations are reported as constituted at date of each census. Dash indicates place did not exist during reported census, or data was not available.

An excess of males over females has always been a feature of Manitoba's population, but this excess steadily declined and by 1961 had almost disappeared. The population is mixed by national origin; in 1961 only 43% were of British origin. There are large minorities of French, Ukrainian, German, Dutch, Polish, Scandinavian and Jewish origin; many other nationalities are represented by smaller groups. Several European languages are spoken in different parts of the province.

The United Church of Canada is the largest religious denomination (1961 census, 269,975 adherents), followed by the Roman Catholic (210,871) and Anglican (127,487) Churches; there are also considerable numbers of Lutherans, Mennonites, Presbyterians, Greek Orthodox, Ukrainian Catholic and Jews.

Education.—Public-school education (primary, secondary and technical) is administered by locally elected school boards under the general supervision of the provincial department of education, and financed by government grants and local rates. Many rural schools are one-room schools. There are two stages of secondary education: the junior high school offers a general program with options for special interests; the senior high school has five courses—general, agricultural, industrial, commercial and home economics. Teachers are trained at the University of Manitoba, the Manitoba Teachers' college and at Brandon college. The University of Manitoba, at Fort Garry near Winnipeg, has over 6,000 students. It was founded in 1877, modeled after the University of London, and empowered to offer instruction in 1900. Affiliated

colleges are Brandon, nondenominational (founded 1899); St. Boniface, Roman Catholic (1818); and at Winnipeg, St. John's, Anglican Church of Canada (1866); United, United Church of Canada (established 1938 by union of Manitoba college, 1871, and Wesley college, 1877); St. Paul's, Roman Catholic (1926); and Manitoba Law school (1914).

Production.—**Agriculture.**—Although Manitoba is traditionally thought of as an agricultural province, the relative importance of farm produce declined steadily after 1937, and by 1957 the value of manufacturing was almost three times as great. Agriculture became more diversified with less dependence on grain crops. Out of a total production valued at more than \$250,000,000 in the 1960s, field crops contributed a little over one-half while most of the remainder was made up of livestock and derived products. The importance of wheat declined while that of oats, barley, pasture land, canning crops and grass and fodder crops increased.

Wheat still led in value of production with oats second, although more of the latter were grown; barley was third in importance, followed by flaxseed, potatoes, mixed grains and rye. Sunflowers, grown for their oilseeds, occupied 25,000 ac. in the Red river valley. The production of sugar beets, though small and limited to lands close to the Winnipeg refinery, increased from 80,000 tons in 1948 to 188,000 tons by 1961. Wheat seeding normally takes place in May and the harvest in August. Frost in the ground stops plowing in November. There are more than 700 grain elevators with a total storage capacity of 60,000,000 bu.

The principal animal livestock is cattle (about 900,000), followed by swine and sheep; there is a large demand from the U.S. for Manitoba cattle. Because of mechanization there are very few horses left. Chickens and hens, turkeys, ducks and geese are raised and more than 30,000,000 dozen eggs are produced annually. Beekeeping and honey production (6,000,000 lb.) are noteworthy.

Agricultural land is concentrated in the southern part of the province, where about 7,000,000 ac. are cultivated (4,000,000 tilled, 3,000,000 summer fallow). Another estimated 2,500,000 ac. could be developed elsewhere in the province and after 1950 land reclamation projects were under way in northern Manitoba.

The federal government has worked an experimental farm at Brandon since 1888, with substations at Melita (soil reclamation), Portage la Prairie (special crops) and Wabowden (crop testing in the northern clay belt). There is a horticultural experimental farm at Morden. The province has about 50,000 farms; their average size is about 300 ac., which is relatively small for the prairie. About 95% are served with electricity.

Forestry.—Pulpwood accounts for 70% of forest production (over \$25,000,000 annually). A survey made in 1956 showed that about 120,000 sq.mi. or about one-half the total area of the province was forested and that timber reserves amounted to 27,400,000 cords. The forested lands are almost all crown land and administered by the provincial forest service. Fire is a great hazard; annually nearly 300 fires burn more than 200,000 ac.

Fishing.—The fresh-water fishery of Manitoba is one of the most valuable in the world and produces about 30,000,000 lb. of fish a year valued at over \$5,000,000. Lake Winnipeg provides about half the catch. The principal fish caught in order of poundage are pickerel, whitefish, pike, sauger, tullibee (cisco), suckers, perch, bass, trout and carp. More than 5,000 commercial fishermen take part, using motorboats in summer and fishing through the ice from snowtractors in winter. Aircraft and refrigerated boats, trucks and rail cars are used to transport the fish, 90% of which is sold in the U.S. Sports fishing is a major tourist attraction, with about 82,000 licensed anglers taking part in the summer season and about 3,000 in the winter season.

Mining.—The value of mineral production rose sharply after 1945; during the 1950s it increased from \$25,000,000 to more than \$50,000,000 and reached almost \$200,000,000 in the 1960s. Nearly three-fourths is made up of metals, principally nickel, copper, gold and zinc. Petroleum, with annual production more than 4,000,000 bbl., has become one of the most important single minerals.

Copper, zinc, gold, silver, cadmium, selenium and tellurium are produced at Flin Flon, which has been the principal mining and smelting centre in the province since 1930. Copper and nickel

have been produced at Lynn lake since 1951, and there are gold mines at Bissett. Gold has been mined around Herb and Snow lakes since 1946.

In Dec. 1956 it was decided to begin mining nickel in the Mystery-Moak lake area. Private interests and the province invested \$180,000,000 in the construction of mines, concentrator, smelter, refinery, railways, a hydroelectric power station and a townsite (Thompson). By the early 1960s rated capacity was 75,000,000 lb. a year.

Petroleum is produced in the southwestern part of the province near Virden, where commercial production began in 1951. The oil is of good quality, though sometimes affected by excess sulfur.

Electricity.—A remarkably rapid growth in the supply and consumption of hydroelectricity after World War II made Manitoba the most completely electrified province in western Canada. Six power stations were on the Winnipeg river 70 mi. N.E. of Winnipeg and supplied the towns and rural areas of southern Manitoba; others were in northern Manitoba on the Laurie and Nelson rivers and on Island lake.

Manufacturing.—The gross value of manufactured goods in the 1960s was more than \$700,000,000, or more than double the combined value of agricultural, mining, forest and fishery output. Growth—an increase of 84% was recorded for the ten-year period 1947–57—was based upon increased population, advantageous position with respect to communications, greater diversification of agriculture and expanding mineral, forest and water-power exploitation. The industries of the province, which are mostly located in the Winnipeg area, serve a regional market extending from the Rockies to the Great Lakes and containing about 20% of Canada's population and national income.

Almost 50,000 workers are employed in industry and the payroll is about \$150,000,000. The food and beverages industry is most important; its major subdivisions are meat packing and slaughtering. Iron and steel products come next, followed by petroleum and coal products; this industry rose from 12th to 3rd place in ten years. Fourth in value of output, but second in numbers employed, is the transportation-equipment industry, producing railway rolling stock, buses, and automotive and aircraft parts. The clothing industry, including fur processing, chemicals, electrical goods and textile and leather products, also is important.

Communications.—Southern Manitoba enjoys unusually good transport facilities because the approach of the northern wilderness toward the U.S. frontier compels east-west traffic to concentrate in the Winnipeg area. Westward from Winnipeg, rail, road and air routes fan out over the prairies.

Canadian National railways and Canadian Pacific railways operate nearly 5,000 mi. of railway in the province; these are centred on Winnipeg, the major rail town of western Canada, possessing some of the largest freight yards in the world. A 510-mi. railway, opened in 1929, connects The Pas with the northern port of Churchill on Hudson bay. Churchill is only about 450 mi. farther from Liverpool, Eng., than Halifax on the Atlantic coast, but this advantage is offset by the short navigable-season (July–October) and the distance from Winnipeg. Nevertheless, nearly 20,000,000 bu. of grain are exported from Churchill in some years and it possesses a modern 5,000,000-bu. elevator. The nearby military base greatly increased the use and importance of the port.

The most important main roads are the Trans-Canada highway, running from east to west, and two highways into the U.S. Roads also serve the beach resorts on the lakes north of Winnipeg. There are bus services from Winnipeg, Brandon and other towns to most of the inhabited parts of the province. Winnipeg is a stopping place on all Canadian transcontinental air services, some of which also serve Brandon. The northern resort, mining and fur-trapping centres are accessible by regular or chartered aircraft.

The telephone system is owned and operated by the province; it has more than 280,000 subscribers, more than half of whom are in Winnipeg. The principal radio station is CBW with transmitter at Carman. There are several local privately owned stations. CKSB at St. Boniface is a French-language station. Television stations include CBWT and CBWFT (French) in Winnipeg and CKX-TV at Brandon.

MANITOBA, LAKE, a narrow, irregularly shaped lake in the Red river lowlands of Manitoba, Can. Discovered by Pierre de la Vérendrye in 1738, the lake is 124 mi. long and lies 813 ft. above sea level. Its southern end is 80 mi. N.W. of Winnipeg and 25 mi. N. of Portage la Prairie. Separated from Lake Winnipegosis by a narrow isthmus, it is a remnant of Lake Agassiz which covered the area in glacial times. It has a valuable commercial fishery and there are small settlements and summer resorts located around its low and often swampy shores. Many of the settlers are Icelandic in origin. (W. H. Pr.)

MANITOWOC, seat of Manitowoc county, Wis., U.S., is an industrial city and port on Lake Michigan at the mouth of the Manitowoc river, 83 mi. N. of Milwaukee. A French Canadian established a post there in 1795 and permanent settlement by Americans began in 1836. The city was incorporated in 1870. Manitowoc was early renowned for its shipbuilding; hence its nickname of "Clipper city." It built a sailing ship of 62 tons in 1847 and a steamboat of 434 tons in 1861. The harbour, which is kept open throughout the year, handles more than 2,400,000 tons of freight annually. Railway car and auto ferries connecting with Michigan ports account for about 60% of this total. The city has a diversified industry with a labour force of more than 6,000. One-third of that number is engaged in shipbuilding and maintenance, and as many more in aluminum work. Other important industries are food packing, lumber, wood products and furniture, paper, metal products including toys, and electrical and other machinery. The name Manitowoc means "spirit land." For comparative population figures see table in WISCONSIN: Population. (W. F. Ry.)

MANIU, IULIU (1873–1953), Rumanian statesman, a peasant leader who was twice prime minister between 1928 and 1933, was born at Simleu Silvaniei (Szilágyosmlyó) in Transylvania on Jan. 8, 1873, of a Rumanian peasant family, members of the Uniate Church. He was educated first at Blaj, seat of the Uniate metropolitan and centre of the Rumanian irredentist movement, and later studied law at Cluj, Vienna and Budapest. He early took an active part in the national struggle of his compatriots in Transylvania; and he was elected deputy to the Hungarian parliament in 1906. In World War I he served in the Austro-Hungarian army on the Russian and Italian fronts, but in May 1918 he organized a revolt of the Rumanian troops, in preparation for Transylvania's independence and ultimate attachment to Rumania. He was elected head of the short-lived regional government at Alba Iulia and subsequently sat in the Rumanian parliament, first as head of the National party of Transylvania and after 1926 as head of the National Peasant party, formed from the fusion of the former with the Peasant party of Ion Mihalache (q.v.).

Maniu formed a government on Nov. 10, 1928, and at the elections held on Dec. 12 (the first free elections in Rumania) his party won 349 seats out of 387. He was not opposed to the return of King Carol II from exile in June 1930, but resigned on Oct. 6, considering that the king had not kept his promises. Maniu was in power once more for a brief period (Oct. 1932–Jan. 1933). As he disagreed with Carol, he never again headed a government. His periods of office had coincided with the world depression and he never had full opportunity for carrying out his policies.

To the general surprise, Maniu formed an electoral alliance with the Fascist Iron Guard in 1937 in an attempt to forestall the king's plan to set up a dictatorship. He refused all offers of posts in the governments formed under the dictatorship.

Though he had no knowledge of France or England, Maniu was firmly on the side of the Allies during World War II. He did not oppose Rumania's entry into the war against the U.S.S.R. in June 1941, regarding the reconquest of Bessarabia as legitimate, but he protested strongly at the Rumanian army's crossing the Dniester river into Soviet territory beyond that province. Thereafter he became one of the principal resistance leaders and started clandestine negotiations with the Allies. He and Dinu Brătianu (q.v.)

were the main organizers of King Michael's *coup d'état* of Aug. 23, 1944. With the increasing control of Rumania by the Russians from the spring of 1945 onward Maniu's position became precarious, but he was left at liberty until after the peace treaty had been signed (Feb. 10, 1947). He was arrested on July 14, 1947, and sentenced on Nov. 11 to hard labour for life on charges of espionage and treason. He died in Sighet prison in 1953. Though more successful in opposition than in office, he was widely respected and is generally regarded as one of Rumania's leading statesmen of the 1920s and 1930s. (B. Br.)

MANIZALES, a city of Colombia on the western flank of the volcanic Central Cordillera, 75 mi. S. of Medellín. Pop. (1958 est.) 151,670. It is situated on a commanding ridge-top (elevation 6,988 ft.), its gray cathedral visible for miles in all directions. Manizales was founded in 1848 by colonists from Antioquia. In 1905 it was made capital of the newly created department of Caldas. The airport is located 20 mi. away, near the Cauca river. An unusual means of transportation, an aerial cableway across the crest of the Central Cordillera, connects Manizales with Mariquita and the Magdalena river. Manizales is the halfway point on the principal highway between Bogotá and Medellín and is also connected by highway and railroad with the Quindío region and Cali. It is the centre of Colombia's most important coffee-growing district; nearby, at Chinchiná, is an important coffee experiment station. (Js. J. P.)

MANKATO, a city in south central Minnesota, U.S., the seat of Blue Earth county, about 85 mi. S.W. of Minneapolis. The site was settled at the head of navigation on the Minnesota river in the early 1850s by Henry Jackson, Parsons K. Johnson and Daniel Williams of St. Paul. It was incorporated as a village in 1865, was chartered as a city in 1868, and adopted the city-manager form of municipal government in 1953. Mankato is the Sioux name for the blue earth of the region, once thought to be copper-bearing. In its early years as a frontier settlement it was menaced by hostile Indians. The Sioux uprising of 1862 culminated there in the multiple hanging of 38 Indians out of more than 400 who were tried for massacring white settlers. It is the centre of a prosperous farming region, and has an important hog market and many agricultural processing plants, two of which process a large part of Minnesota's soybean crop. Other industries include the manufacturing of cans, electrical equipment, brake assemblies, insulation and cement and the quarrying of limestone. The city is a large wholesale and retail trade centre. Mankato State college (1868) and Bethany Lutheran college (1911), a junior college, are located there. For comparative population figures see table in MINNESOTA: Population.

(H. T. H.)

MANLANGUAGES. The term "Man" (in Chinese, "south-east barbarian") is applied to languages also known as "Yao" which together with the Miao languages constitute a group (Miao-Yao) spoken by hill peoples in southern China, North Vietnam, Laos and northern Burma. The Miao-Yao languages are imperfectly known but appear to be an independent group remotely related to the Mon-Khmer languages (Mon and Cambodian). They have no writing system of their own and no published literature.

Haudricourt, "Introduction à la phonologie historique des langues miao-yao," *Bulletin de l'école française d'extrême-orient*, 44:555-576 (1954). (W. S. CN.)

MANLEY, MARY DE LA RIVIÈRE (1663-1724). English writer of *romans à clef* directed against the Whigs (especially the duchess of Marlborough and her faction), who in 1711 succeeded Swift as editor of the *Examiner*. The daughter of Sir Roger Manley, governor of the Channel Islands, she was born in Jersey on April 7, 1663. In 1709 she achieved notoriety by her *Secret Memoirs . . . of Several Persons of Quality*, a scandalous chronicle "from the New Atlantis, an island in the Mediterranean," in which she sought to expose the private vices of the ministers whom Swift, Lord Bolingbroke and Robert Harley, earl of Oxford (*qq.v.*), combined to drive from office. She was arrested as the author of a libelous publication but was discharged on Feb. 13, 1710. Mrs. Manley (her cousin John Manley married her bigamously c. 1688)

wrote her "fictitious autobiography" as *The Adventures of Rivella: or, the History of the Author of the Atlantis* (1714). Other works are her tragedy *Lucius, the First Christian King of Britain* (1717) and *The Power of Love, in Seven Novels* (1720). She died in London July 11, 1724.

See articles by G. B. Needham in the *Huntington Library Quarterly*, xii (1949), xiv (1951).

MANLIUS, the name of a patrician Roman family. The two most famous Manlii were the following:

MARCUS MANLIUS CAPITOLINUS (d. 384), consul 392 B.C. According to tradition, when in 390 B.C. the besieging Gauls were attempting to scale the Capitol, he was roused by the cackling of the sacred geese, rushed to the spot and threw down the foremost assailants. Several years after, seeing a centurion led to prison for debt, he freed him with his own money and sold his estate to relieve other debtors. He was charged with aspiring to kingly power and condemned to death when the assembly had adjourned to a place whence they could no longer see the Capitol which he had saved (384). His house on the Capitol was razed and the Manlii resolved that henceforth no Manlius should bear the name of Marcus. The account of his alleged revolution was much elaborated by the annalists writing after the time of the Gracchi.

See Livy, v, 47; vi, 14-20.

TITUS MANLIUS IMPERIUSUS TORQUATUS, twice dictator (353, 349 B.C.) and three times consul (347, 344, 340). When his father was brought to trial by the tribune M. Pomponius for abusing his office of dictator, he forced Pomponius to drop the accusation by threatening his life. In 361, during a war with the Gauls, he killed one of the enemy, a man of gigantic stature, in single combat and took from him a *torques* (neck ornament), whence his surname. When the Latins demanded an equal share in the government of the confederacy, Manlius vowed to kill the first Latin he saw in the senate house. During the Latin revolt Manlius, consul for the third time, gained two great victories in Campania (340). In this campaign Manlius executed his own son, who had killed an enemy in single combat and thus disobeyed the express command of the consuls.

See Livy, vii, 3-5; 10; viii, 3-7.

MANN, HEINRICH (1871-1950), German novelist and man of letters, the elder brother of Thomas Mann, was born at Lübeck on March 27, 1871. He entered the publishing profession, but after the death (1891) of his father, a substantial grain merchant, he became financially independent, and lived in Berlin, spending long periods abroad, particularly in France. His early novels portray the decadence of high society (*Im Schlaraffenland*, 1900; Eng. trans. *In the Land of Cockaigne*, 1929), but his later books show him as a more serious critic of the greedy seeking for wealth, position and power in Wilhelmine Germany (*Professor Unrat*, 1905, Eng. trans. *The Blue Angel*, 1932; *Der Untertan*, 1918, written 1914, Eng. trans. *The Patrioteer*, 1921; *Die Armen*, 1917; *Der Kopf*, 1925). His novels were accompanied by essays attacking the arrogance of authority and the subservience of the "subjects"; particularly noteworthy is the *Zola* essay of 1915, which led to a breach with his brother. After 1918 he became a prominent spokesman of writers' associations and radical democracy, and published volumes of political essays, *Macht und Mensch* (1919) and *Geist und Tat* (1931). Forced into exile in 1933, he spent the rest of his life in France and the United States. His historical novel *Henri Quatre* (two parts, 1935 and 1938) is his most mature work, and represents his ideal of the humane use of power. He hoped to return to the German Democratic Republic, but was prevented by the illness from which he died in Santa Monica, Calif., on March 12, 1950.

See H. Ihering, *H. Mann* (1951); A. Kantorowicz, *H. und T. Mann* (1956). (Ro. P.)

MANN, HORACE (1796-1859), U.S. educator, "the father of American public education," was born in Franklin, Mass., on May 4, 1796. He grew up in an environment governed by poverty, hardship and self-denial. His early schooling came in brief and erratic periods of eight to ten weeks a year, and from comparatively poor teachers. But he managed to educate himself in the Franklin town library, and with the help of some tutoring by an

itinerant schoolmaster he gained admission at the age of 20 to the sophomore class at Brown university. He did brilliant work at Brown, manifesting great interest in problems of politics, education and social reform; his valedictory address, on the progressive character of the human race, was a model of humanitarian optimism, portraying the way in which education, philanthropy and republicanism can combine to allay the wants and shortcomings that have traditionally beset mankind.

Upon graduation in 1819 Mann chose law as a career. There was a brief period of reading law with a Wrentham, Mass., lawyer, followed by an interlude of teaching at Brown. Then came a time of more concentrated study at Litchfield (Conn.) Law school, and finally admission to the bar in 1823. Meanwhile, he had decided to settle in Dedham, and there his legal acumen and oratorical skill soon won him a seat in the state legislature. From 1827 to 1833 he served in the Massachusetts house of representatives, where he led in the establishment of a state hospital for the insane at Worcester, the first of its kind in the United States. In 1833 he moved to Boston and was elected to the Massachusetts senate, where he served four years, the last two as president of that body.

Of the many causes Mann espoused, none was dearer to him than the education of the people. Nineteenth-century Massachusetts could boast a public school system going back to 1647. Yet during Mann's own lifetime, the quality of education had steadily deteriorated as school control had gradually slipped into the hands of economy-minded local districts. A vigorous reform movement arose, committed to halting this decline by reasserting the state's influence over the schools. The result was the establishment in 1837 of a state board of education, charged with collecting and publicizing school information throughout the state. Much against the advice of friends, who thought he was tossing aside a promising political career, Mann accepted the first secretaryship of this board.

Endowed with little direct power, the new office demanded moral leadership of the highest order and this Mann supplied for 12 years. He started a biweekly *Common School Journal* for teachers, and lectured widely to interested groups of citizens. His 12 annual reports to the board ranged far and wide through the field of pedagogy, stating the case for the public school and discussing its problems. Essentially his message centred in six fundamental propositions: (1) that a republic cannot long remain ignorant and free, hence the necessity of universal popular education; (2) that such education must be paid for, controlled and sustained by an interested public; (3) that such education is best provided in schools embracing children of all religious, social and ethnic backgrounds; (4) that such education, while profoundly moral in character, must be free of sectarian religious influence; (5) that such education must be permeated throughout by the spirit, methods and discipline of a free society, hence harsh pedagogy in the classroom is undesirable; and (6) that such education can be provided only by well-trained, professional teachers who have mastered their subject matter and the pedagogical arts as well. Mann encountered strong resistance to these ideas—from clergymen who deplored nonsectarian schools, from educators who condemned his pedagogy as subversive of classroom authority and from politicians who opposed the board as an improper trespass on local educational authority—but in the end his views prevailed.

Mann resigned the secretaryship in 1848 to take the seat of former Pres. John Quincy Adams in the United States congress. There followed a stormy period during which he took an uncompromising stand against slavery. In 1853, having run unsuccessfully for the Massachusetts governorship a year before, he assumed the presidency of Antioch college in Yellow Springs, O., a new institution committed to coeducation, nonsectarianism and equal opportunity for Negroes. There, amidst the usual crises attendant upon the running of an infant college, Mann finished out his years. He died at Yellow Springs on Aug. 2, 1859. Two months before, he had given his own valedictory in a final address to the graduating class: "I beseech you to treasure up in your hearts these my parting words: Be ashamed to die until you have won some victory for humanity."

MANN, THOMAS (1875-1955), German novelist and essayist, who won the 1929 Nobel prize for literature and whose work is a significant expression of the spiritual situation in Germany and Europe during his lifetime, was born at Lübeck on June 6, 1875. His father, a patrician and substantial grain merchant, died in 1891, and Mann, after perfunctory work in an insurance office and on the editorial staff of *Simplicissimus* in Munich, devoted himself to writing.

Influenced by Schopenhauer, Nietzsche and Wagner, Mann at first saw in art the creation of value in a world unconcerned with meaning, and his early stories centre in the incompatibility of art and life. But he distinguished himself from the aestheticism of those years through his ironical treatment of the "decadent" artist and through an almost involuntary appreciation of normal practical life. His first great success, *Buddenbrooks* (published in 1900; dated 1901), was intended to show how a merchant family loses its grip on life as its members become engrossed with spiritual values and art, but it became too a tender celebration of work and family loyalty. The semi-autobiographical *Tonio Kröger* (1903) delineates Mann's position, an artist cut off from practical social existence yet attracted to its orderliness and positivism and hostile to bohemianism. Still preoccupied with this problem in *Königliche Hoheit* (1909), where he imposes an idyllic reconciliation, in the tragic *Tod in Venedig* (1912) Mann transfers his attention to the conflict within the artist himself, between his nervous and decadent sensibility and his self-discipline through formal mastery.

The outbreak of war in 1914 roused Mann to patriotic fervour. In *Betrachtungen eines Unpolitischen* (1918) he defended German authoritarianism as the rampart of artistic "inwardness," of "Kultur," while he attacked democracy as the political concomitant of superficial "civilization." But in the early years of the Weimar republic he began to be critical of these formulations, which he later repudiated. A first somewhat tortuous declaration of democratic principle (*Von deutscher Republik*, 1922) was succeeded by a major statement in the novel *Der Zauberberg* (1924). Its theme is the development of the young hero through the seductions of inwardness and death that he experiences as a voluntary inmate of a tuberculosis sanatorium, up to the point where he decides for life and service to his fellow countrymen. The protracted arguments between the rationalist democrat Settembrini and the irrationalist totalitarian Naphta document the crisis of Europe; Hans Castorp seeks a middle way, skeptical but humane.

Some of Mann's most charming personal pieces belong to the decade after 1918 (*Herr und Hund*, 1919; *Unordnung und frühes Leid*, 1926), but the mounting political crisis in Germany forced him, against his own nature as he felt, to become more and more a political figure. *Mario und der Zauberer* (1929) is a short story that depicts Fascism in the form of a seedy illusionist, and *Ein Appell an die Vernunft* (1930) is a bold address calling on Germans to unite against Hitlerism. After 1933 life in Germany was no longer possible for Mann, and he went to the United States, visiting Germany after 1945 but never living there again. He died in Zürich on Aug. 12, 1955. Numerous essays and speeches express his humanistic passion and his hatred for National Socialism and the mystical primitivism that nurtured it in intellectual circles. After World War II he sought to maintain bridges between east and west, particularly between East and West Germany.

All Mann's later novels emerge from his deep engagement in the spiritual crisis of Europe. In the four volumes of *Joseph und seine Brüder* (1933-44) he rewrote the "fairy tale" of the biblical Joseph in order to create a consoling myth for modern humanity. *Lotte in Weimar* (1939) celebrates Goethe's renunciation of the destructive raptures of his youth in favour of life and work.

Both are distinguished by that "reverence for man" that Mann defined as true religion. His most sombre novel, *Doktor Faustus* (1947), the story of a composer who sells his soul to the devil, is a symbolic description of the corruption of German and European humanism in Mann's lifetime. The last works show a certain relaxation of imaginative intensity (*Der Erwählte*, 1951; *Die Betrogene*, 1953), though *Felix Krull* (1954), the continuation of an earlier fragment, is a brilliantly humorous story of a swindler.

Mann was a writer of great range and subtlety, equally successful in the evocation of figures and scenes as in philosophical discussion. His works lack simplicity and, sometimes, human feeling; indeed he distrusted simplicity in a world that so easily abused it. But despite its sophisticated irony his work is full of tender concern for mankind. For a portrait of Mann see article GERMAN LITERATURE.

See also *The Stature of T. Mann*, ed. by C. Neider (1947); R. Pascal, *The German Novel* (1956). All Mann's works have been published in English translations by H. T. Lowe-Porter and others; among the English titles are *The Magic Mountain* (*Der Zauberberg*), *Death in Venice* (*Tod in Venedig*), and the separate volumes of *Joseph and His Brothers* under various titles. Volumes of correspondence include *Briefe 1889–1936*, ed. by Erika Mann (1961); *Briefe 1937–1947*, ed. by Erika Mann (1963); *Briefe an P. Amann 1915–52*, ed. by H. Wegener (1959); *Briefwechsel mit R. Faesi*, ed. by R. Faesi (1962); *Gesammelte Werke*, 12 vol. (1960).

MANNA. Although the word "manna" is familiar and widely quoted, it has no exact meaning; it may refer to plants or even birds. However, it popularly connotes a miraculously supplied food—"the bread of heaven." Not all the references to manna (in at least ten books of the Bible) signify the same species of plant; that falling from heaven, in the wilderness (Ex. xvi), was presumably wind-borne lichens, while the "honeydew" manna of many later references signifies gummy exudations or resins from several desert trees and shrubs. Exodus xvi: 13–15 states "... Behold it will rain bread from Heaven ... the children of Israel saw it, they said one to another, it is manna: ... taste of wafers made with honey ... and the children of Israel did eat manna forty years. ..."

Lichens.—The biblical manna is believed to be the lichen *Lecanora esculenta*—perhaps also *L. affinis*, *L. fruticulosa* and *L. tartarea*. A lichen (*q.v.*) is a synthetic plant, consisting of a partnership of a green alga and a fungus. *Lecanora* is a relative of reindeer moss (*Cladonia rangiferina*), famed in the arctic tundra as sustenance for reindeer herds.

Lecanora manna ranges from southern U.S.S.R. to Syria and Iran; it is absent from the Sinai desert and eastern north Africa but is found in Algeria and the Atlas mountains. During drought, it curls into lightweight flakes or balls, which break loose easily. Strong winds carry it great distances and windrows often accumulate in the desert, wafted from the mountains. In 1854 a manna shower fell upon Persia during drought and famine. In 1891 an abundant fall was reported in Turkey. It is supposed that manna was, in this way, provided Moses while en route to the Promised Land, or that a migration of quail may have coincided with the blowing in of lichen, providing additional food. Bedouin herdsman collect lichen manna and consume it mixed with one-third meal. In many parts of the near east, lichen breads are baked and a manna jelly is prepared.

Resins.—The camel's-thorns of Asia Minor (*Alhagi maurorum* and *A. pseudalhagi*) are spiny-branched shrubs up to 3 ft. tall, with simple leaves. They occur in the wastes of the Middle East. Heat or insect activity causes them to exude a resin, which hardens and may be collected by shaking the bushes over a cloth spread on the ground. The French tamarisk (*Tamarix gallica*), a shrub up to 15 ft. in height, with scalelike leaves and clusters of tiny pink flowers, occurs in the deserts of the same area as the *Alhagi* and is common in the Sinai. A scale insect either punctures the stem, triggering the exudation, which hardens in drops, or secretes the manna itself. Bedouins collect this honeylike material, considering it a great delicacy.

The flowering ash (*Fraxinus ornus*), a tree up to 50 ft. high,

with pinnate leaves, ranges from southern Europe into Syria and Lebanon and is cultivated on some Mediterranean islands. In summer the branches are slashed and the juices exude and harden as manna (the source of commercial manna). Ash manna is a sweetish exudate, finding limited commerce as flakes (flake manna) or fragments (common manna) or viscid droplets (fat manna). Chemically it consists of mannin, which is a laxative, demulcent and expectorant.

One of these purchasable "sweet mannas" was likely referred to in the book of Baruch i: 10, "... and prepare ye manna, and offer upon the altar of the Lord. ..." Authorities have also suggested a dozen other arid land species that might be the source of gum-resinous mannas, including legumes, willows, oaks, pears, cedars and members of the genus *Eucalyptus* and the composite family.

(R. W. SY.)

MANNAEANS. The Mannaeans occupied the country called Mannai or Mana in northwestern Iran which lay south of Lake Urmia in modern Azerbaijan and Kurdistan. During the period of its existence in the early 1st millennium B.C., Mannai was surrounded by three major powers: Assyria to the west, Urartu to the north and Media to the southeast. The Mannaeans are first recorded in the annals of the Assyrian king Shalmaneser III (859–824 B.C.) during a period of Assyrian expansion eastward. Following the Assyrian decline at the end of the century the area is first mentioned by the Urartian king Menuas (810–781 B.C.). An inscription at Tas Tappeh (Tash Tepe), near modern Miandow Ab (Miyanduab), celebrates his victory in the plain of Missi over the Mannaeans town of Meista. In 714 B.C. the Assyrian Sargon II (722–705 B.C.) broke the power of Urartu in his famous eighth campaign with a long march around Lake Urmia. Mannaeans are last mentioned in the annals of Urartu by Rusa II (685–645 B.C.) and in Assyria by Esarhaddon (681–669 B.C.). Minor references occur in Neo-Babylonian literature, but in general with the intrusion of the Scythians and the rise of the Medes in the 7th century Mannaeans lose their identity and are subsumed under the term Medes. Scattered references by later historians refer to the people of this area as the Minni (Jeremiah), Matieni (Herodotus and Polybius), or Mantiane (Ptolemy).

Archaeological investigations at Hasanlu Tepe, near Nagadeh, and the Ziwiye treasure found near Saqqez, show a culture rich in metal work with a local art style which was originally quite distinct from that of surrounding areas but which gradually came under Assyrian and Scythian influence. Architecture and pottery show a fusion of elements related to prehistoric Iran, northern Mesopotamia and eastern Anatolia. Motifs on the gold Hasanlu bowl suggest strong contact with these Hurrian-speaking areas. This contact may be historically significant since both place names and personal names in Mannai are thought to be in a Hurrian-related dialect.

(R. H. DY.)

MANNAR (MANAAR), GULF OF, a shallow gulf of the Indian ocean lying between the southern coast of Madras state on the west and the coast of Ceylon on the east. Its width varies from 80 to 170 mi. and its length from north to south is approximately 100 mi. Its northern limit is marked by a low-lying peninsula on the Indian side, extended by a number of islands and a line of rocks known as Adam's bridge (*q.v.*) to Mannar Island on the Ceylonese side. Channels between the islands (of which Pamban channel is the most used) lead into the shallow Palk strait lying between northern Ceylon and the Indian mainland. A branch of the South Indian railway was built out over the islands on the Indian side to a small rail port at Dhanushkodi, only 22 mi. from a similar rail port, Talaimannar, on the Ceylon side. Until the development of air traffic, this was the main route for passengers and mail from south India to Ceylon. (L. D. S.)

MANNERHEIM, CARL GUSTAF EMIL, BARON (1867–1951), Russian and later Finnish army officer, called the George Washington of modern Finland, was born at Villnäs, near Turku, Fin., on June 4, 1867. He began his military career as a lieu-

tenant of cavalry in the Russian army in 1889, and served in the Russo-Japanese War and in World War I. By 1917 he was a corps commander with the rank of lieutenant general. In Dec. 1917, following the Russian Revolution, he returned to his native Finland, which had declared its independence. In Jan. 1918 he assumed command of the "White" forces opposing the Bolsheviks, leading them to victory in four months. He became regent of Finland in Dec. 1918, holding this position for seven months until a republic was declared.

In 1931 Mannerheim returned from retirement to become chairman of the defense council. During his eight years in this post there was built a line of fortifications across the Karelian isthmus, popularly called the Mannerheim line in his honour. At the age of 72, Mannerheim served as commander in chief in the defensive "winter war" against the Soviet Union (Nov. 1939 to March 1940). The brilliance and remarkable skill of this campaign against a great power led to a relatively favourable peace settlement. Following a new Soviet attack in June 1941, Mannerheim continued to serve as commander in chief until peace was negotiated in Aug. 1944. He was named the only marshal of Finland in June 1942. Mannerheim became president of the republic in 1944, retiring because of ill health in 1946.

He died at Lausanne, Switz., on Jan. 27, 1951. He wrote *Across Asia From West to East in 1906-1908* (1940); the *Memoirs of Marshal Mannerheim* was published in English in New York in 1954.

(R. L. Gf.)

MANNERISM is the name now given to the style which prevailed in the arts in Italy from about 1520 until about 1590. The word derives from the phrase *di maniera*, meaning "by rote," frequently used by G. Vasari and others to describe the creation of a work of art without reference to nature but by dependence on an inner idea, formed originally in the artist's mind from nature, but modified by aesthetic considerations and by the study of other works of art.

Early in the 20th century it was realized that the art of the period between the death of Raphael and the rise of the Carracci and Caravaggio (q.v.) is not simply a decadent version of the high Renaissance but a fundamentally different style. The reasons for this change are manifold, although a school of Marxist historians in the 1920s sought to explain the phenomenon in terms of the economic and social crises precipitated by the rise of Lutheranism and, still more, by the catastrophe of the sack of Rome in 1527. The sack of Rome came as a numbing shock to contemporaries; and it led to the complete collapse of the serene and apparently stable world of humanist values which had given birth to the Renaissance and to a marked increase in religious emotion in the arts, but the external causes do not explain Mannerism as an artistic phenomenon: it is also necessary to refer to artistic reasons. A desire for a new style, expressed in what would now be called Mannerist terms, can be traced well before 1527 and even in Raphael's own last works, most notably in the "Transfiguration" (Vatican gallery) begun in 1517. This was the result of two main factors: the general feeling that the Stanze (in the Vatican palace) of Raphael, or the architecture of Bramante, represented a norm of classical perfection and that no further progress was possible on that road; and the opening of new vistas in the use of the nude as a means of emotional expression by Michelangelo's "Battle of Cascina" and Sistine chapel ceiling, whereby many artists fell into the trap of regarding "clever" poses, much foreshortening and anatomical knowledge as ends in themselves. Others, perhaps more sensitive to approaching disaster, began to impart a tension into their works directly at variance with the serenity of the Renaissance style. In architecture the deliberate flouting of Bramante's ideas in favour of a new style, both exciting and deliberately allusive, can best be seen in the Palazzo del Tè at Mantua, begun in 1525 by Raphael's pupil Giulio Romano (q.v.).

The neurosis implicit in much early Mannerist art was partly caused by its exponents, for Rosso, Jacopo da Pontormo and Parmigianino were all somewhat unbalanced; but they created a religious art of direct and personal expressiveness which was later continued outside central Italy by Tintoretto and El Greco, who, with the aged Michelangelo, were the greatest artists of the style.

Mannerism is a negative style based on rejections and unresolved conflicts. The imitation of nature is modified in favour of the "idea" in the artist's mind (see G. P. Lomazzo, *Trattato dell'Arte* . . . , 1584), compositions are deliberately asymmetrical and too little picture space is allotted to the figures, thus crowding them together and emphasizing the twisted and elaborate poses imitated from Michelangelo. Figures are much elongated to gain in grace and also for the sophisticated pleasure of breaking the classical rules of proportion. It is essentially a learned art, for the spectator is supposed to be both shocked and thrilled by this rule-breaking as where Michelangelo, in his Laurenziana library in Florence, recessed columns into the wall thus contradicting their strengthening function.

In the second half of the century Mannerism itself became codified into a set of elaborate rules, but many fine portraits of cold elegance were painted (by Bronzino in Florence and N. Hilliard in England, for example), and much of what began as an Italian movement was copied, though rarely understood, by the Romanists in the Low Countries, France and elsewhere. According to some critics, Mannerist influences are discernible in certain trends of modern art and literature, such as Surrealism (see G. R. Hocke, *Die Welt Als Labyrinth*, 1957).

Blunt, *Artistic Theory in Italy, 1450-1600* (1940); N. Pevsner, "The Architecture of Mannerism," *The Mint* (1946); W. Friedlaender, *Mannerism and Anti-mannerism in Italian Painting* (1957).

MANNERS, CHARLES (1857-1935), Irish bass singer and operatic impresario, whose real name was Southcote Mansergh was born in London on Dec. 27, 1857. After studying singing in Dublin, London and Italy, he joined the D'Oyly Carte company and in 1882 became known for his performance as the squire in *Iolanthe* at the Savoy theatre. Subsequently he appeared in operatic productions in London, the U.S. and South Africa. He married Fanny Moody, a leading soprano, in 1890. In 1897 they formed the Moody-Manners opera company, which made a number of successful tours in the provinces and also performed three seasons in London. Manners died at Dundrum, County Dublin, on May 3 1935.

MANNHEIM, a town of Germany which after partition of the nation following World War II was located in the *Land* (state) of Baden-Württemberg, Federal Republic of Germany. It lies at the confluence of the Neckar with the Rhine and is joined by a railway and road bridge with Ludwigshafen on the left bank of the Rhine. The old town, which is surrounded by the *Ruhe*, is built like a chessboard in 136 rectangular blocks of houses, known as the *Quadranten*. Pop. (1961) 313,890.

First mentioned in 766 as a village, Mannheim was fortified in 1606 and received its privileges and municipal law in 1607. It was destroyed in 1622 during the Thirty Years' War and again in 1689 in the struggle for succession which led to the War of the Grand Alliance. In 1720, however, when Charles Philip of the Palatinate moved his residence from Heidelberg to Mannheim it was rebuilt. The castle, the Jesuit church, the old town hall and the market place with the Unteren Pfarrkirche, the Kaufhaus and the Zeughaus or arsenal are among the baroque buildings of this period. Learning and the arts were cultivated and the Mannheim school of conductors, violinists and composers, the art gallery and the academy of sciences had a European reputation. In 1778 the court moved to Munich. In the same year the National theatre was opened and in 1782 it gave the first performance of Schiller's *Die Räuber*. In 1795 Mannheim was destroyed for the third time during the French wars, and in 1802 it was transferred to Baden. In 1848-49 it was at the centre of the revolutionary movement.

Mannheim's economic rise in the 19th century was due to its position at the highest navigable point on the Rhine for large ships. By the end of the century it had developed from a commercial into an industrial city. In World War II more than half the town was destroyed in air raids but the castle, the Jesuit church, the old town hall and the arsenal were later rebuilt.

Mannheim's chief manufactures are chemicals, cellulose, soap.

machinery, steel, electrical and railway equipment, foodstuffs and tobacco. Of special importance is the import trade and trade in coal and iron. With more than 1,000 yd. of quays, numerous docks and a dock railway, Mannheim has the second largest inland harbour in Europe. Mannheim has remained a cultural centre with the National theatre (rebuilt 1954-57, with two stages), colleges for music and drama, engineering and industry, and art collections in the Reiss museum and the Kunsthalle. (G. Jb.)

MANNING, HENRY EDWARD (1808-1892), English cardinal and archbishop of Westminster, was born July 15, 1808, at Totteridge, Hertfordshire, youngest son of William Manning, banker and member of parliament. He went to Harrow school in 1822 and to Balliol college, Oxford, in 1827. He was president of the union in 1829. In the following year he took his degree with first class honours in classics. He was a clerk in the colonial office until, on resolving to be ordained in the Church of England, he returned to Oxford in 1832 as a fellow of Merton college. Without regarding himself as a Tractarian, he accepted the tenets of the Oxford movement (*q.v.*). His relations with J. H. Newman (*q.v.*) were friendly but not intimate. He was ordained deacon in 1832 (priest, 1833), became curate at Lavington, Sussex, and married a daughter of his rector, John Sargent, whom he succeeded as rector (1833). Manning gave himself completely to his parish work. The death of his wife in 1837 affected him profoundly, but he found relief in the reading of the early Fathers and in his increasing responsibilities in the diocese of Chichester of which he became archdeacon in 1840.

The problem of the relation between church and state was foremost in Manning's mind. He opposed any government interference in ecclesiastical and educational affairs; it was along this line, rather than that of doctrine, that he was to make his way to the Roman Catholic Church. He was critical of those who left the Church of England, but he found Newman's *Development of Christian Doctrine* (1845) unanswerable. During a long visit to Rome in 1847 he studied the organization of the Roman Catholic Church and had an audience with Pius IX, but he was shocked to find the little concern shown for the Anglican Church. He was forced to consider his position when in March 1850 the privy council overruled the refusal of a bishop to institute G. C. Gorham on grounds of unorthodoxy (*see* ENGLAND, CHURCH OF). Manning felt that this was an intolerable interference by a lay tribunal, but when he tried to mobilize opinion on his side the response disheartened him. It was the parting of the ways. On April 5, 1851, he saw Cardinal Wiseman and on the following day was received into the Roman Catholic Church. In taking this step, he was throwing away the certainty of high preferment for an uncertain future in a church regarded with aversion by his countrymen.

Wiseman was quick to appreciate Manning's outstanding abilities, and ordained him priest on June 14, 1851. Manning studied theology in Rome and soon won the regard of Pius IX and of the cardinals, but he also became the intimate of George Talbot, a tattler who amused the pope; their association brought out the least admirable side of Manning's character—his readiness to achieve ends, however disinterested, by backstairs influence.

In 1857 he founded and was the superior of the congregation of the Oblates of St. Charles who were put at the disposal of the archbishop of Westminster; at the same time. Manning was appointed by the pope to be provost of the Westminster chapter. This rapid promotion combined with his increasing influence with Wiseman roused the opposition of those who felt that Manning had not yet "worked his passage." When complaints reached Rome, Wiseman wrote a detailed report setting out Manning's considerable achievements—his success in winning converts, his effectiveness as a preacher and, above all, his devotion to the needs of the poorer Catholic children. This tribute and his personal knowledge of Manning during visits to Rome influenced the pope when, on Wiseman's death in 1865, he made Manning archbishop of Westminster. It was a startling appointment, for his name had not been put forward by the bishops or by the chapter, but it was fully justified. Manning intensified his efforts to safeguard Catholic children by building many more schools and by establishing institutions for the neglected and homeless. After the

rather lenient rule of Wiseman, the new archbishop's authoritative rule seemed hard to some, but priests soon found a friend in Manning.

He was an extreme ultramontanist, and was determined to make the church in England a true reflection of the church in Rome. In all this he was encouraged by W. G. Ward, editor of *The Dublin Review*; unfortunately both regarded any opposition as disloyalty to the church. It was here that they clashed with Newman and accused him of minimizing, as they put it, the authority of Rome.

Manning played a leading part in the debates on infallibility at the Vatican council of 1869-70, but the resultant definition was more moderate than he wished. He was created cardinal in March 1875.

In the last phase of Manning's life he gained a high position in public regard. He served on the royal commission on housing in 1884 and readily supported many charitable causes. His successful intervention in the London dock strike of 1889 was his most publicized achievement. The encyclical *Rerum novarum* of Leo XIII on the condition of the working classes of 1891 put the seal of papal approval on Manning's social work. He died in London on Jan. 14, 1892.

None of his many articles and books has endured; they were effective for the occasions for which they were written, but there was not sufficient depth of thought to give them permanence.

BIBLIOGRAPHY.—E. S. Purcell, *Life of Cardinal Manning*, 2 vol. (1896), is a primary source as most of the documents are no longer available; it needs to be read with qualifications, since it misrepresents some episodes and ignores others. Shane Leslie, *Henry Edward Manning* (1921), helps to correct this distortion. Lytton Strachey, "Cardinal Manning," in *Eminent Victorians* (1918), should not be taken too seriously. A. W. Hutton, *Cardinal Manning* (1892), is still of interest as an Anglican view; it contains the only bibliography of Manning's writings. V. A. McClelland, *Cardinal Manning, His Public Life and Influence, 1865-1892* (1962), concentrates on Manning's social work. *See also* E. E. Reynolds, *Three Cardinals* (1958).

(E. E. RE.)

MANNING, JAMES (1738-1791), American Baptist clergyman and first president of Brown university, was born at Piscataway, N.J. on Oct. 22, 1738. He attended the Baptist Latin school at Hopewell, N.J., graduated from Princeton (B.A., 1762) and was ordained to the Baptist ministry at Scotch Plains, N.J., on April 19, 1763. Between his graduation and ordination he traveled throughout the colonies, partly in a missionary interest and partly to survey possible sites for a college. Baptists were intent on founding a college, and Manning, who stood second in his class at Princeton, was put in charge of the project. Rhode Island, which was near the geographical centre of the 14 colonies, was selected, and Manning was commissioned to stop at Newport on his way to Halifax in July 1763 to put the plan in operation. A charter was granted by the Rhode Island assembly in March 1764, and in April, Manning settled in Warren, R.I., opened a Latin school, and organized a church to help provide his support. The following year the college opened its doors, and in 1770 it was shifted to Providence, where Manning also served as minister of the First Baptist church. Instruction was disrupted by the American Revolution, but by the end of Manning's 26-year administration the college was firmly established. Manning also helped organize the Baptists of New England into the Warren association (1767), presented a memorial for religious liberty to the Continental congress in 1774, represented Rhode Island in the Congress of the Confederation in 1786, and drafted a report in 1791 urging the establishment of free public schools. He died on July 29, 1791.

Documentary materials are printed in R. A. Guild, *Early History of Brown University* (1897).

(W. S. H.)

MANNY, SIR WALTER DE MANNY, BARON DE (d. 1372), soldier of fortune, military and naval commander, and founder of the London Charterhouse, was a native of Hainaut. The friend and patron of Froissart, his career is an example of how an able and talented young man, nobly born but without resources, could end his life a peer, a landowner and a person of considerable importance in the England of Edward III.

Manny probably went to England in 1327 in the retinue of

Philippa of Hainaut, when she went to marry Edward III. Knighted in 1331, he was appointed admiral of the fleet north of the Thames in 1337 and again in 1348, and appears to have done some good convoy work. In 1347 he was summoned to parliament as a baron by writ, and attended intermittently till his death. He married a granddaughter of Edward I, and by 1372 he had possessions in 16 English counties.

Manny, according to Froissart, was a person of unusual charm. He was also devout, and in 1371 he founded a house for Carthusians, the famous Charterhouse, near Smithfield. It is possible that Michael Northburgh, bishop of London from 1355 to 1361, had been associated with the project, but Manny was the effective founder and in his will he directed that he should be buried without pomp in the monastery he had begun. In fact, when he died in London about Jan. 15, 1372, the funeral of this former landless squire was attended by a great company, headed by the king and his sons. (I. P. S.)

MANNYNG (OF BRUNNE), ROBERT (fl. 1283–1338), early English poet and author of *Handlyng Synne*, a poem of popular morality, and of the chronicle *Story of England*. He is probably to be identified with a Sir Robert de Brunne, chaplain, named as executor in a Lincoln will of 1327; apart from this mention his biography can only be reconstructed from his writings. He was born at Brunne (Bourne), Lincolnshire, in 1283 or somewhat earlier, and in c. 1300 was at the University of Cambridge, where he met Alexander, brother of the future King Robert the Bruce of Scotland. For 15 years (c. 1302–c. 1317) Mannyng was a Gilbertine canon at Sempringham priory, Lincolnshire, the original foundation of the order. There in 1303 he began *Handlyng Synne* and was still working at it after 1307. For many years before 1338 he was engaged on the *Story of England*, which he wrote at the request of the prior of the Gilbertine house at Sixhills near Market Rasen, Lincolnshire. The *Story of England*, the author relates, was finished between three and four o'clock, on Friday, May 15, 1338.

Handlyng Synne is an adaptation in about 13,000 lines, in short couplets poorly versified, of the *Manuel des Péchés*, which is usually ascribed to William of Waddington (or Widdington), an Englishman, probably a Yorkshireman, writing in Anglo-Norman between 1250 and 1270. The text of the *Manuel* remains amorphous; there are more than a score of manuscripts, which present the work in many degrees of completeness and expansion—evidently it was highly popular and influential. Like Waddington, Mannyng aimed to provide a handbook which should serve to stimulate careful self-examination as preparation for auricular confession. *Handlyng Synne* is thus an exact title, and the English work and its source represent extensions into the terms of popular thought and into vernacular languages of the copious clerical literature on confession which had developed in western Europe from the end of the 12th century.

Mannyng follows his original closely. He sometimes omits, but more often amplifies to elucidate doctrine, does not hesitate to soften the rigour of injunctions and in general shows a superior power in organization. He deals in turn with the Ten Commandments, the Seven Deadly Sins and the sin of sacrilege, the Seven Sacraments, the 12 requisites of confession and the 12 graces of confession. There is much direct instruction, exhortation and didactic comment, but each of the topics is illustrated by one or more tales. These *exempla* have sometimes been considered to provide the particular interest of the work. Most of them are drawn from the *Manuel*, but Mannyng sometimes provides a local setting and sometimes goes back to Waddington's sources for further detail. He also adds 13 fresh stories, some from the Bible and several of local provenance. The whole work is designed for oral delivery. Mannyng's merit as a storyteller lies in his apt management of material and in his lucid, direct narration. Otherwise the literary merits of *Handlyng Synne* are negligible, although its documentary value for social history is great. It illustrates clearly the attitudes and values of the English minor clergy and peasantry in the early 14th century; throughout there is much comment on the social, domestic, parochial and commercial scene. The poem was popular in the 14th and 15th centuries; passages from it were

worked into other compositions. Its modern appeal will be found in its moralized realism.

Of similar literary quality is Mannyng's later work, the *Story of England*; but, as Mannyng's editor, F. J. Furnivall, observes, whereas the matter of *Handlyng Synne* is fact, the basis of the *Story of England* is fiction. As history it is almost worthless. The work falls into two parts. The first, in something less than 9,000 lines written in short couplets, tells the story from Noah to the death of Caedwalla in 689. In form and substance Mannyng follows *Le Roman de Brut* by the Anglo-Norman poet Wace, but he draws also on Bede, on Geoffrey of Monmouth (Wace's source) directly and on the Anglo-Norman *Chronicle* of Peter Langtoft (q.v.). In the 9,000 lines of the second part, taking the story to the death of Edward I (1307), Mannyng relies primarily on Langtoft's *Chronicle* and again adopts the metrical form of his original, in this case the alexandrine couplet, which he manages clumsily.

He continues to incorporate material from other sources—from Bede again, from lives of English saints and from later historians—and he adds scraps of his own. Of particular interest is his use of popular romance. Into his account of Aethelstan he inserts the story of Guy of Warwick's encounter with the giant Colbrand, he affects surprise that no reputable historian has dealt with Arthur or with Havelock and he draws heavily on the extravagant 14th-century romance of Richard the Lion-Hearted. Following Langtoft, but with some variations from Langtoft's text, he works into his narrative several topical songs, mainly on the Scottish wars of Edward I's time.

Handlyng Synne and the *Story* are preserved independently in several manuscripts, none contemporary with Mannyng and none of certain provenance; but insofar as the original east midland dialect of composition can be discerned, Mannyng's language is of importance in tracing the development of the spoken and literary standard of English. *Meditations of the Supper of Our Lord*, a verse rendering of part of the *Meditationes vitae Christi* of St. Bonaventure, has been ascribed to Mannyng on no better ground than that in two manuscripts it is transcribed immediately after *Handlyng Synne*.

BIBLIOGRAPHY.—Mannyng's *Handlyng Synne* was ed. by F. J. Furnivall, with text of the *Manuel* in parallel, for the Roxburghe Club (1867) and with extracts from the *Manuel* for the Early English Text Society (original series 119, 123, 2 vol. (1901–03); there is no satisfactory edition of the *Manuel des Péchés*. The 1st pt. of *The Story of England* was ed. by F. J. Furnivall, "Rolls Series," 2 vol. (1887); for the 2nd pt. see *Peter Langtoft's Chronicle*, T. Hearne (ed.), 2 vol. (1728). See also Ruth Crosby, "R. M. of B.: A New Biography," Publication of the Modern Language Association of America, vol. lvii (1942); F. J. F. Wells, *A Manual of the Writings in Middle English, 1050–1400* (1916) and *Supplement* (1919–51).

MANOAH (in the Douai version of the Bible *MANUE* in biblical history the father of Samson (q.v.). The story, according to Judg. xiii, is that a messenger appeared first before Manoah's wife, who had been childless, and announced that she was to bear a son, who would begin to deliver Israel from the Philistines. He admonished her to abstain from drinking wine or strong drink and to "eat nothing unclean." After learning of this visit, Manoah prayed to have the messenger return to give him more instructions concerning the child. When he appeared before Manoah, the angel answered his questions by repeating his instructions to the woman. When Manoah made a burnt offering of a kid, the angel ascended with the flames toward heaven. The child that was later born to them was named Samson. Samson was buried, according to Judg. xvi, 31, in his father's burying place between Zorah and Eshtael.

MANOBO, a pagan people of the Philippines. Numbering about 70,000 in the 1960s, they occupy a large, sparsely settled territory in east-central Mindanao Island. The name Manobo does not designate a single sociopolitical unit; rather it refers to peoples who speak closely related dialects of what is probably a single language and who share similar cultures. In physical type the Manobo are not markedly distinguishable from most neighbouring groups, including the Christian Filipinos. They speak one of the Central Philippine group of Malayo-Polynesian

languages (*q.v.*) which includes Tagalog, Bisayan (*qq.v.*) and many other Philippine tongues. Rice and other crops are grown on dry fields annually cleared and burned in the forest; houses are rectangular, thatched pile dwellings. Manobo traditionally made their own clothing from abacá fibre (*q.v.*) or from imported cloth. Iron tools and weapons, occasionally home-forged, typically are imported from neighbouring pagan groups (*see* BACOCO; BUKIDNON; MANDAYA).

A community of dispersed single-family households under the informal leadership of an influential warrior forms the largest political unit. Ties of bilateral kinship bind the Manobo within and between communities. Although warriors and religious specialists are accorded special prestige, Manobo society is basically egalitarian; everyone is primarily a farmer. Increasing economic and political pressures by Christian settlers have seriously disrupted the Manobo way of life. Large numbers of Manobo have been acculturated to the ways of Christian Filipino peasants.

MANOR. The term *manerium* (manor) was introduced into England and the English language by the Normans to describe an institution which was already in existence there, as well as in the rest of Europe and elsewhere. It occurs in societies where the predominant unit of organization of agricultural production is the peasant family holding and where the ruling class, a territorial aristocracy, depends for the greater part of its income on profits derived from agriculture rather than from industry. It is not a term that can properly be applied to estates where the chief labour force consisted of slaves, as in parts of the ancient world, and it is equally inapplicable to estates where the labour force consists of free hired men.

The manor was, essentially, an organization through which a lord exercised economic and political domination over his men. It often coincided with the natural unit of settlement and agricultural exploitation, the village, but a village could contain more than one manor, or a manor could contain more than one village. The boundaries of manorial domination therefore, could, often divide the natural peasant community. The manor's importance as an institution varied from time to time and from place to place. In western Europe it was already flourishing by the 8th century and was beginning to decline in the 13th century, whereas in eastern Europe its growth was complicated in the central period of the middle ages by big population movements, and it achieved its greatest strength after the 15th century.

Early Manorial Organization.—The most satisfactory early descriptions of manorial organization are to be found in the 9th-century estate surveys of the great landowners of the Carolingian empire, supplemented by instructions for the administration of the imperial estates. The most famous estate record is the *polyptyque* of Irminon, abbot of St. Germain des Prés, near Paris, probably drawn up at the beginning of the 9th century, but there are analogous documents from estates in other parts of the empire. These surveys show that at that time the big estates were composed of a number of *villae*, that is, manors. The *villa* at this time normally included one or more of the natural units of settlement, the village or hamlet. Its land was divided in varying proportions into arable, vineyards, meadow and woodland, and it was also divided in varying proportions between the demesne (the *mansus indominicatus*) of the lord and the peasant holdings (also known as *mansus*). Over the 21 *villae* of St. Germain des Prés for which there are details, the extent of the demesne and tenant holdings were roughly equal, though the tenant holdings contained nearly four times as much arable as the demesne.

This division between demesne and tenements was the principal feature of manorial organization in the early middle ages and existed in Lorraine, in the Low Countries, in northern Italy and in western Germany. The demesne-tenement ratio naturally varied considerably, from one to ten to one to one. In rare cases

the demesne area was even larger than the tenanted area. It is certain that the Carolingian estate documents did not record a new phenomenon, for the division between demesne and tenures is found in the late Roman empire and is referred to in the laws (*c.* 690) of the Anglo-Saxon king Ine of Wessex. Far away from the influence of either Rome or of the Franks, in the lands of both eastern and western Slavs, basically the same type of agrarian organization made its appearance. Polish historians date the growth of the big estates with demesne production from the establishment of the Polish state in the 9th century. In Kievan Russia the same phenomenon probably existed in the 10th century and perhaps earlier. It is not possible, however, to give any exact details about proportions of demesne and tenant land, for detailed estate surveys are not found at an early date in eastern Europe. Even in pre-Conquest England the evidence for the manor is very incomplete. Domesday Book (1086), however, provides abundant evidence of widespread manorial organization, undoubtedly of Anglo-Saxon origin. There, as on the continent of Europe, large demesnes were surrounded by, and closely associated with, the holdings of the dependent tenants.

Closely related to the division of the manor between demesne and tenements was the organization of the labour force that worked the demesne. The manor grew up in an era when the predominating feature of social organization was the comprehensive network of personal dependency. In conditions of war, poverty and lack of government, men exchanged their freedom and gave their services in return for the protection of the powerful. The jurisdiction that landowners claimed as lords of slaves and freedmen was strengthened by the wider jurisdiction that as immunity (*q.v.*) holders they obtained from the public authority. Added to more or less accepted rights was the sheer coercive pressure of the class that had not only wealth but military force. As early as the end of the 8th century Charlemagne had complained in the Second Capitulary of Mantua (*c.* 787) that officials and powerful vassals had forced men, with the pretense that it was simply a request (*quasi deprecando*), to do various services, such as plowing, sowing, weeding and mowing. These were the conditions that determined the particular features of demesne cultivation on most of the big estates of northwestern Europe between the 8th and the 13th centuries.

The nucleus of the labour force consisted of permanent farm servants whose entire time was spent in the lord's service. In the earliest times, before the manor proper had developed, these consisted of slaves; but in the early middle ages slavery was being replaced by serfdom. By the 11th century, permanent farm servants began to be recruited from the servile families and were paid wages in money or in kind. Alternatively they were allowed a small holding of land as a remuneration for full-time service. This did not provide a labour force sufficient for the cultivation of the demesne, and consequently part of the rent from the peasant holdings of the manor was taken in the form of labour. Thus was created the economic interdependence of demesne and peasant tenements characteristic of early medieval estate management.

Labour obligations due from different types of peasant holding varied according to the size of the holding and also according to its origin. The tenants were responsible for several different types of labour service on the demesne, such as plowing services, week work, boon work and carrying services. The plowing services (often including harrowing and even sowing with the tenant's own seed) could be specifically attached to a named piece of the demesne land but were more generally arranged as a supplement to the main work done by the permanent servants with the demesne plows. Week work constituted the heaviest burden and was often associated with the most servile kind of tenements. From the full family holding (the manse) no less than three days' work a week on the demesne was normally demanded, sometimes more. The nature of this work was usually unspecified. Boon works, theoretically a voluntary offering, were usually associated with haymaking and harvest. At this season the maximum labour force was required, and consequently boon works were often owed from free tenements not otherwise burdened with labour services.

Carrying services were needed for supplying the market or the lord's household.

Manorial Organization in England.—The internal economics of the manor are best illustrated from the English evidence. The manor was a very ancient institution in England, and there is a school of historians that believes that there was direct continuity between the Roman *villa* and the medieval manor. This has not been proved, but it seems certain that manorial organization, in the form described above, was to be found at a much earlier date in the Anglo-Saxon period than the opponents of the theory of Roman origin have admitted. But if there exists fragmentary evidence suggesting forms of manorial organization as early as the 7th century, it is not until the 10th century that documentary evidence becomes adequate enough to show that English estates closely resembled those in contemporary Francia. From the time of the invaluable Domesday survey a large number of estate surveys were made, containing detailed manorial descriptions; from the mid-13th century their evidence can be supplemented by estate accounts and records of manorial courts.

English manors varied considerably from region to region. The large manors of old-established estates usually coincided with the village or parish. But England was also full of small, often impermanent manors, containing only a fraction of a village's land and population. Some manors were in areas of primarily arable farming; others were in pastoral areas. Some were hardly more than loose groups of rent-paying tenants; others were tightly organized institutions where the tenants were fully involved in the economy of the demesne. But the principal features common to all types of manors sprang from the essential fact that the lord of the manor had jurisdictional control over his tenants. This control was exercised through the manor court (*see COURT BARON*), presided over by the steward. Here were appointed such officials as the reeve to act as general overseer, the hayward to watch over the demesne crops and to bring offenders to court, the rent collector and the woodward. Here the tenants were directed, punished and mulcted. Here they had to register land transactions between themselves (where permitted) and to surrender or take up holdings under the lord. The court and the officials were a permanent feature of all manors, but the way in which the lord made his profit varied from time to time.

Later Developments in England.—On the big estates in the 10th, 11th and 12th centuries the landlords for the most part demanded from their manors a fixed return in cash or kind. The agent appointed to collect and pay over this farm (*Lat. firma; O.E. feorm*) was, therefore, almost in the position of a lessee. But at the turn of the 12th century an increasing need for cash income, coinciding with increased monetary circulation and rising agricultural prices, moved landlords to replace the farmers responsible for fixed returns by professional bailiffs or peasant reeves; these were expected to maximize manorial cash profits and had therefore to render annual accounts.

Manorial income was made up of rent from the peasant holdings, sales of produce from the demesne (mainly of grain and stock but also of wool in sheep-raising districts), profits of manorial justice and payments made by such tenants as were serfs. These included heriots (payment of the best beast from the peasant holding at death or on surrender), entry fines paid to take up a holding, tallage (*q.v.*) and licence payments for permissions, for instance, to marry or to sell livestock. Costs consisted of maintenance or purchase of equipment and buildings, purchases of seed and livestock, and wages. Labour costs naturally bulked large.

By the end of the 13th century on most manors the system of labour services due from the peasant holdings, especially from the servile or customary holdings, had been elaborately classified and valued at so much for a day's work of a specific type. These services appear, at any rate on the bigger estates, to have been more onerous than the labour services listed in the Carolingian *polyptyques*, sometimes involving as many as five or six days' work a week from holdings that may have been smaller than the Carolingian manse. These heavy labour services were long established; they existed in Wessex in the time of Ine, were fully

elaborated in the 10th century, were in no way diminished by the 12th century and seem to have increased by the mid-13th century. Paradoxically, however, by the latter date they were only sparsely used, usually at the critical periods of haymaking and harvesting.

Otherwise the main labour force on the demesne was hired for wages. The permanent staff, the plowmen, carters, herdsmen and dairymaids, were paid partly in money and partly in kind. In addition, at peak periods casual labour was hired, almost entirely for cash payments. Such traditional labour services as were not required (usually the majority) were "sold"; i.e., temporarily commuted. The detailed valuation of labour services must have been drawn up with this transaction in view, and increases in labour services may have been imposed as much with the object of increasing the lord's cash income as for increasing labour supplies on the demesne. It was always convenient to be able to call on peasant labour due from the holdings, but by the mid-14th century most manorial demesnes were worked by hired labour.

As this situation was reached, however, demographic and other crises brought about another change in manorial management. Falling profits made manorial lords realize that the costs of direct administration were too great, and by the end of the 14th century, at any rate on the bigger estates, they leased their demesnes to farmers, usually for a money rent, and permanently commuted the labour services from the peasant holdings. The rent paid by the demesne lessee (often a peasant) was sometimes greater than the net cash revenue under the old bailiff system, which suggests that the new lessee may have managed to make a better profit from the demesne than the landlord had done.

Although the legal framework of the English manor, as of the continental *seigneurie*, lasted long after the abandonment of direct control of production by the lord, it lost much of its institutional vitality. The peasant farmers, or more particularly the small group of wealthy peasant families in each village, became for perhaps two centuries, until the big technical and social changes of the 17th and 18th centuries, the driving force of the agrarian economy.

Later Manorial Development on the Continent.—In western Europe the earliest type of manorial organization, characterized by the interdependence of demesne and tenements, quickly disintegrated, especially after the era of population expansion and commercial revival that began in the 11th century. Peasant holdings were subdivided to provide for increased numbers, labour services became difficult to enforce, and customary money rents failed to keep pace with rising prices. As labour became more difficult to obtain and as an increasingly numerous class of military tenants and estate officials was provided with fiefs, the demesnes on some estates were reduced. But, in general, demesne production remained an important item of income and was rendered the more valuable in face of declining rents. Gradually an important new source of income was created from the extension of landlord power over the population as a whole. This power was now exercised not only on the few huge estates of the earlier potentates but also in the counties, baronies and castles of wider categories of the nobility. Between the 10th and the 13th centuries these nobles extended their control over all the families living in the area of their private jurisdictions, irrespective of whether or not they were tenants. This jurisdiction enabled the nobility to establish monopolies of the wine press, the oven and the mill; they were able to require hospitality and other services, to exact aids and arbitrary tallages, to levy tolls and to demand a new range of labour services not only from tenants but from all "subjects."

Ultimately the new profits greatly exceeded the diminishing income provided by the rents and services paid by tenants for their holdings. This transformation of manorial forms was mainly characteristic of France and western Germany, though in Italy the old organization had disintegrated even earlier.

Eastern Europe, particularly eastern Germany, Poland, Bohemia, Moravia and Hungary, experienced a curious evolution of manorial forms. A manorialism analogous to that of the west

existed on a few big ecclesiastical and other estates before the 12th century. But during this century the colonization of wood and waste that was taking place piecemeal in the west became a mass phenomenon in the east, and hundreds of free villages of German and Slavonic peasant colonizers were created. In these free villages the person of importance was not the lord of the manor but the village mayor. Distinguished from his neighbours only by a larger holding than theirs, he had no claim on labour services and possessed little jurisdictional power.

Nevertheless, this development of a free peasantry did not long affect the social structure. The disturbed conditions of eastern Europe, brought about by Prusso-Polish wars, Russo-Lithuanian and Russo-Tatar wars and by the Hussite wars in Bohemia, rapidly reproduced the social and political insecurities that had earlier been so productive of peasant enservment. In addition, the growing demands of western Europe for the grain of the Baltic area gave the landlords an added incentive for the enservment of the peasants in order to bind them to provide labour services for grain-growing demesnes. By the 16th century in many parts of eastern Europe, but especially in eastern Germany and Poland, the manor, with its interdependence of demesne and tenures, was re-created.

Meanwhile, in western Europe the manor, *seigneurie* or *Grundherrschaft*, though persisting as a form of social and political organization, was tending to lose its economic significance because the management of the demesne was no longer connected with the control of the peasant population. Until the early 14th century, demesnes in both England and France were kept in hand by the estate owners, but in the latter part of the 14th and in the 15th century they were progressively leased, in whole or in part, to lessees of peasant, urban or gentle origin. This dissociation in western European agriculture of peasant from landlord farming—perhaps even the absorption of landlord farming by the peasants—opened the way to those early capitalist forms which contrasted so notably with the reactionary manorial developments in eastern Europe and Russia.

MANOR HOUSE, the dwelling of the lord of the manor or his residential baillif, and the administrative centre of the feudal estate. Development in the middle ages is related to that of the castle (*q.v.*), which is however distinguished by its primarily defensive character and greater political significance as a military strong point. Early manors were generally fortified, licence to crenellate being required from the king, and the evolution of domestic planning at the expense of more military considerations is in proportion to the degree of peaceful settlement of any country or region. With the church, the medieval manor house was the centre of village life, its hall the scene of the manorial court and the place of assembly of the tenantry. Usually the work of local craftsmen, the house was more subject than the castle to local influences, physical and political, giving rise to distinctive regional forms of building. The particular character of the manor house is most clearly represented in England and France, but under different names the dwellings of feudal overlords are to be found in all countries wherein the manorial system developed, fulfilling similar functions within the national expression of style and period.

In England in the 11th century, the early manor house was an informal group of related buildings in timber or stone comprising the hall, chapel, kitchen and farm buildings contained within a defensive wall and ditch. The manor house of Boothby Pagnell,

NATIONAL BUILDINGS RECORD

OCKWELLS MANOR, BERKSHIRE

Lincolnshire, is of late 12th-century date and comprises a hall and private chamber placed defensively at first-floor level over a storage undercroft, and contained within a moated enclosure. In large houses at this time the hall (*q.v.*), which throughout the medieval period was the major element of domestic architecture, was more conveniently planned at ground level, as in Oakham castle, Rutland, within a more strongly defended enclosure, and subsequently this hall arrangement was generally adopted. Stokesay castle, Shropshire, is the finest surviving example of a fortified manor house of the 13th century, the ground-floor hall being flanked by towers and further defended by a moated enclosure. By the 14th century the manor house plan was clearly defined, with private living apartments and service rooms planned at opposite ends of the great hall, the parts being more closely integrated, in many major instances enclosing an irregular courtyard, while battlements, gatehouse and moat continued to be provided as at Igham Mote, Kent. Cothay manor, Somerset, is a characteristic house of the 15th century showing little advance in planning but having more domestic character than earlier instances, while Ockwells manor, Berkshire, also built in the 15th century, is the regional timber framed expression of the same hall plan, without defensive pretensions.

Comparable development in France was delayed by internal conflict, and until the ending of the Hundred Years War, in 1453, considerations of defense dominated manorial building. Such early manor houses as that at Saint Medard en Jalle, near Bordeaux, built in the 13th century, and the 14th-century Manoir de Camarsac (Gironde) comprise a rectangular fortified tower in which the principal rooms are at first-floor level above cellars, standing with subsidiary buildings in a walled and moated enclosure. In Normandy, the Manoir d'Ango, near Dieppe, reveals some advance in domestic planning in the 15th century, the house standing at one end of a courtyard, flanked by farm buildings and defended by a gatehouse.

With the decline of manorial significance coinciding with increased prosperity and the call for more commodious dwellings, development of the manor house in the 16th century emerges into that of the Renaissance country house. In England, increased formality combined with the new use of bricks and terra cotta produced more elaborate buildings, frequently of regular quadrangular plan, the hall declining in size and importance. Sutton place, Surrey (*c.* 1525), illustrates this phase, which leads to the more complex block plans of the Renaissance as at Ramsbury manor, Wiltshire (*c.* 1680), where the hall is reduced to the status of an entrance. The defended tower-house tradition persists in France throughout the 16th century in such instances as the Manoir des Tourelles, at Rumilly, near Troyes, generally retaining corner turrets and other defensive archaisms, while revealing classical influence in the symmetry of the *appartement* plan, which was later to become a feature of the Renaissance château. In later years the title of manor house in England lost particular significance, being adopted by large country mansions which had no manorial foundation.

(R. B. W.-J.)

MANRESA, a town of northeastern Spain in the region of Catalonia and province of Barcelona, lies on the Cardener river 68 km. (42 mi.) N.W. of Barcelona by road. Pop. (1960) 52,216. Manresa is a picturesque old town, believed to be the Munorisa of the Romans and important during the middle ages. Three bridges cross the river there and on a rock above the oldest stands the yellow stone church of Santa Maria de la Seo (13th and 14th centuries). Below the 17th-century church of San Ignacio is the Cueva de San Ignacio (cave of St. Ignatius of Loyola) where he wrote the *Spiritual Exercises*. In the cloisters is the municipal museum. There is a conservatory of music. Industries include metallurgy and the making of textiles, tires and glass.

(A. O. S.)

MANRIQUE, GÓMEZ (1415?–1490?), Spanish poet, chiefly remembered as the earliest Spanish dramatist whose name is known, was born at Amusco, Tierra de Campos, and probably died at Toledo. He took a prominent part in the rebellions of the reigns of John II and Henry IV as soldier, politician and diplomat and won fame as an orator during his governorship of Toledo. His *Cancionero* contains 108 poems, written in the manner of the time. His nativity play, *Representación del nacimiento de Nuestro Señor*, his *Lamentaciones fechas para Semana Santa*, and his two *momos*, or interludes, contain the elements of the religious and secular drama of the future.

(C. C. SH.)

MANRIQUE, JORGE (1440?–1479), Spanish poet and soldier, of a noble and literary family, nephew of Gómez Manrique (q.v.), is famous for his elegy on the death of his father. He was born probably at Paredes de la Nava, Palencia, c. 1440, and died near Garci-Muñoz on March 27, 1479. His love songs, satires and acrostic verses are little more than ingenious compositions in the manner of his age; he owes his imperishable renown to the *Coplas por la muerte de su padre* (1476), an elegy in the haunting *pie quebrado* metre, in which each 12-line stanza has 4 triplets, the triplets having lines of 8, 8 and 4 syllables. Although this is based in part on a similar lament by his uncle, and contains numerous echoes of the Bible and Boethius, its derived thoughts and commonplaces on death are transformed by grief into something intensely personal and (for the 15th century) unusually lyrical. The perfect technique and the sublimity of expression help to explain the poem's lasting fame.

(C. C. SH.)

MANS, LE, a town of northwestern France, capital of the département of Sarthe and former capital of the province of Maine. It lies 75 mi. S.W. of Chartres on the railway line from Paris to Brest. Pop. 128,814 (1962 census); 136,083 with suburbs.

The town stands just above the confluence of the Sarthe and Huisne rivers. Several bridges connect it with the quarters of Le Pré and St. Lazare on the left bank. The cathedral is dedicated to St. Julian, the town's first bishop. The nave was built in the 11th and 12th centuries, the transepts in the 14th and 15th. The choir (13th century) is one of the tallest and handsomest in France, and is supported outside by buttresses of exceptionally light design. The cathedral has some magnificent stained glass and remarkable tombs, including the tomb of Queen Berengaria. The church of La Couture, on the site of an abbey founded in the 6th century by St. Bertrand, has parts dating from the 10th century, and a richly ornamented porch of the 13th. The town hall was built in 1775; the prefecture occupies the buildings of the former monastery of La Couture, enlarged in 1770. The 11th- and 12th-century church of Le Pré contains the remains of St. Julian; the church of St. Joan of Arc is a former maison-dieu built by Henry II of England. The Tessé museum exhibits valuable paintings and the famous Geoffrey Plantagenet enamel. Among numerous old houses are the Grabatoire, now the bishop's seat, and the so-called Queen Berengaria's house, both 16th century. Nearby is a museum of early motorcars. Le Mans is the seat of a bishopric and also has a prefecture and a court of assizes.

The town is an important rail and road centre. The principal industrial establishments are a motor works, railway repair shops

and factories for the manufacture of railway carriages, electrical apparatus, tobacco, textiles, plastics, agricultural implements and motor parts. There is also a large dairy and an active trade in cattle, farm produce and wines. Le Mans is the seat of three important insurance companies. Each year it holds a four-day commercial fair and a famous motor race (see *AUTOMOBILE RACING*). It saw some of the first experiments in motoring (i.e. those of Amédée Bollée in 1873) and the first European flights (1908) of the U.S. aviation pioneer Wilbur Wright, to whom there are three monuments in or near Le Mans.

As the capital of the ancient tribe of the Aulerici Cenomani (see *CENOMANI*), Le Mans was first called Vindinon, then Subdunum. At the end of the 3rd century the Gallo-Romans surrounded it with walls, parts of which can still be seen. After the 6th century, Le Mans became the seat of the counts of Maine. It was invaded by the Normans in 1063. Le Mans had secured a communal charter, but in 1076 William the Conqueror deprived the citizens of their liberties. At the death of William's son, Rufus (William II), the countship passed to the Plantagenets, counts of Anjou. Henry II, the first Plantagenet king of England, was born in Le Mans in 1133, and his sons, Richard Coeur-de-Lion and John, fought for the countship of Maine; Berengaria, Richard's widow, finally received it from Philip Augustus as a dowry in 1204. After her death, Le Mans reverted to the French crown. It was occupied by the English during the Hundred Years' War and was besieged several times in the 15th and 16th centuries. In 1793 it was seized by the Vendéans, who were expelled by the Republicans, and it was again occupied by the Chouans in 1799. It was occupied by the Germans in 1815; again in 1871, after the battle of Le Mans (Jan. 1871); and during World War II. It was liberated, without much fighting, on Aug. 8, 1944, by the U.S. 3rd army, and served as a pivot for the U.S. forces and Gen. Leclerc's French corps in their drive toward Argentan and Paris (H. D.)

MANSARD ROOF, a roof having two slopes on every side, the lower slope being considerably steeper than the upper. Although used as early as the mid-16th century by Pierre Lescau at the Louvre, it was named after François Mansart (q.v.), who employed it for Paris *hôtels* and the châteaux of Balleroy, Blois and Maisons. It was probably first used because its predominantly horizontal profile was more in harmony with the classical orders than high-pitched roofs. The mansard, when pierced with dormers, also provides a more spacious and economical attic story. During the mid-19th century it was particularly popular, especially in France and the United States. See also *ROOF*. (Js. S. P.)

MANSART (MANSARD), (NICHOLAS) FRANÇOIS (1598–1666), French architect, who expressed more than any contemporary architect the classical spirit of the 17th century in France, was born in Paris on Jan. 23, 1598. He was the son of a Parisian master carpenter, probably worked under Salomon de Brosse and was certainly strongly influenced by him. By 1635 he was undertaking important commissions for the crown, but the masterpiece of his early period is the château of Balleroy (begun c. 1626) for Choisy, chancellor to Gaston d'Orléans, in which he combines the classicism of De Brosse with the Henri IV brick-and-stone style of building. Soon afterward Mansart reconstructed Blois for Louis XIV's brother. This work, although never completed, shows Mansart's classicism at its most subtle; it was there that he first used the two-sloped type of roof which bears his name (mansard), though, in fact, De Brosse had already used it at Rennes. In 1645 Mansart was commissioned by Anne of Austria to build the church of the Val-de-Grâce in Paris. Though he was replaced by J. Lemercier in 1646, the plan and much of the construction of the walls is Mansart's work. The design derives from Palladio's church of the Redentore at Venice, one of the purest examples of High Renaissance classicism, and a scheme adopted again by Mansart for the chapel at Fresnes. Between 1635 and 1655 he built a number of important houses in Paris in which his subtle and ingenious mind is revealed in skilful planning on sites often awkwardly shaped. The château de Maisons (now Maisons-Laffitte) is the most complete work by the architect to survive. It was completed save for the severely rich decoration by 1640.

Mansart's work is marked by extraordinary clarity and restraint. He was able to combine a flexible use of the classical with great richness of decoration.

See A. F. Blunt, *François Mansart* (1941) and *Art and Architecture in France 1500 to 1700* (1953).

(F. J. B. W.)

MANSART (MANSARD), JULES HARDOUIN (1646?–1708), French architect, who designed Versailles under Louis XIV, was born in Paris probably on April 16, 1646, son of the painter Raphael Hardouin. He was a grandnephew by marriage of the architect François Mansart, whose surname he adopted in 1668. In 1674 Mansart was commissioned by Louis XIV to build a château for Madame de Montespan. He was by this time launched upon a brilliant career under the king's patronage. Among his earlier additions to St. Germain were a number of private houses, including the Hôtel de Lorges (later Hôtel de Conti), his own residence. As official architect to the king he was entrusted with the redesigning and additions to the palace of Versailles and its environs; there he built the new Galerie des Glaces and Orangerie, the Trianon and the north and south wings in a harmonious, classical style. In addition to this enormous project, which occupied much of his life, Mansart built many other public buildings, churches and sumptuous houses. After making additions to the Palais Royal and building part of Orléans cathedral, he completed the famous chapel of St. Louis des Invalides (Dôme des Invalides), Paris, in a blend of Greek classical and baroque styles. He was responsible for the Place Vendôme, the Place des Victoires and the Maison de St. Cyr, all in Paris. His country mansions included the Château de Luneville and the Château de Sagonne. The royal residence at Marly was his creation. One of the most successful architects of his day, Mansart had his own atelier where he worked with collaborators and trained his protégés. He was working on the chapel at Versailles when he died on May 11, 1708.

MANSBRIDGE, ALBERT (1876–1952), prominent English adult educationist and founder of the Workers' Educational association, was born at Gloucester on Jan. 10, 1876. He was educated at the local church school and later at Battersea grammar school, London. He started work at 15 as a clerk, working for the Co-operative Wholesale society, and later for the Co-operative Permanent Building society. In 1903 the *University Extension Journal* published his scheme for a "triple alliance" of the co-operative movement, university extension and the trade unions, and in the same year he founded the Association to Promote the Higher Education of Working Men which became the Workers' Educational association (W.E.A.) in 1905.

From 1906 onward he worked to establish the tutorial class system of the W.E.A. and the first courses were held at Rochdale, Lancashire, and Longton, Staffordshire, under the tutorship of R. H. Tawney. Bishop Charles Gore (*q.v.*) and Archbishop William Temple (*q.v.*) were also among Mansbridge's supporters. In 1916 illness compelled Mansbridge to resign the secretaryship of the W.E.A. The following year he started the Church of England tutorial classes; he also founded the World Association for Adult Education, the British Institute of Adult Education and the Seafarers' Education service, and served on several government and church commissions on education. He was made a Companion of Honour in 1931 and died at Torquay on Aug. 22, 1952. His most important works are *University Tutorial Classes* (1913), *An Adventure in Working Class Education* (1920), *The Older Universities of England* (1923) and *Margaret McMillan, Prophet and Pioneer* (1932). See also ADULT EDUCATION; UNIVERSITY EXTENSION.

See M. D. Stocks, *The Workers' Educational Association: the First Fifty Years* (1953).

(S. J. C.)

MANSEL, HENRY LONGUEVILLE (1820–1871), English philosopher and churchman, born at Cosgrove, Northamptonshire on Oct. 6, 1820, was educated at Merchant Taylor's school and St. John's college, Oxford. He was elected Waynflete professor of moral and metaphysical philosophy at Oxford in 1859 and regius professor of ecclesiastical history in 1867, in which year he also became canon of Christ Church. He was appointed dean of St. Paul's in 1868. Mansel died at Cosgrove on July 30, 1871. In philosophy, Mansel was a follower of Sir William Hamilton

(*q.v.*), developing Hamilton's ideas in an article on metaphysics written for the eighth edition of the *Encyclopædia Britannica* (1857) and defending them, in *The Philosophy of the Conditioned* (1866), against the attacks of John Stuart Mill. In his Bampton lectures, *The Limits of Religious Thought* (1858), Mansel developed Hamilton's doctrine that human knowledge was strictly limited to the finite and "conditioned." The resulting contention that the human mind could not attain to any positive conception of the nature of God provoked much controversy in which Mansel was accused of agnosticism, though he had meant to attack deism, not theism. Mansel's other published works include *Prolegomena logica: an Inquiry Into the Psychological Character of Logical Processes* (1851) and *The Gnostic Heresies of the First and Second Centuries* (ed. by J. B. Lightfoot, 1875). He edited Henry Aldrich's *Artis logicae rudimenta* (1849) and, with J. Veitch, Sir W. Hamilton's *Lectures on Metaphysics and Logic*, 4 vol. (1859–60). See J. W. Burgon, *Lives of Twelve Good Men* (1888).

MANSFELD, a name distinguished in German history, being derived from that of the countship of Mansfeld, whose territory lay in Saxony south of Anhalt, between the Harz mountains and the Saale river. HOYER, GRAF VON MANSFELD, a supporter of the Salian German kings against the dukes of Saxony, was killed fighting for Henry V at Welfesholz (1115). A new house of counts began with BURCHARD III VON MANSFELD (d. 1273). Seventh in descent from him, ALBRECHT (d. 1484) and ERNST (d. 1486) founded respectively the Vorderort and Hinterort lines of counts. The Hinterort line was subdivided into Mittelort and Hinterort branches by Ernst's sons GEBHARD (d. 1558) and ALBRECHT (1480–1560), famous for their protection of Martin Luther and for their services to the Protestant cause. The males of Mittelort, however, died out in 1622, those of Hinterort in 1666. For Vorderort, one of Albrecht's grandsons was JOHANN GEBHARD (d. 1562), archbishop elector of Cologne from 1558, while the others founded, from 1531, six branches of Mansfeld, namely Bornstedt, Eisleben, Friedeburg, Arnstein, Artern and Heldrungen. PETER ERNST I VON MANSFELD (1517–1604), head of the Friedeburg branch and governor of Luxembourg (from 1559) and of the Spanish Netherlands (1588 and from 1592 to 1594), was created a prince of the Holy Roman empire (1594); the famous Protestant general Ernst von Mansfeld (*q.v.*) was his illegitimate son. The male line of Bornstedt, the last surviving branch (with princely rank from the 17th century), died out in 1780; and in 1789 Franz Gundaccar, prince von Colloredo, who had married the eventual heiress of Mansfeld in 1771, was authorized to take the style of prince von Colloredo-Mansfeld.

MANSFELD, (PETER) ERNST, GRAF VON (1580–1626), German soldier of fortune prominent early in the Thirty Years' War (*q.v.*). He was born in Luxembourg, the illegitimate son of the governor of the Spanish fortress there, Peter Ernst I, prince of Mansfeld. The stigma of his birth influenced his career, for, though the Holy Roman emperor Rudolf II legitimized him, he was excluded from any share in his paternal estates. He therefore became an enemy of the house of Habsburg, in whose service he had gained his first military laurels, and in 1609 he turned Protestant.

In 1618 Mansfeld accepted a commission from Charles Emmanuel, duke of Savoy, who aspired to the imperial or, failing that, the Bohemian crown. Mansfeld then led an army to support the Bohemians against the Habsburgs and with the capture of Pilsen gained a firm foothold in the country, there first displaying his mastery of positional warfare. Yet he did nothing to avert the catastrophe that overtook the elector Palatine, Frederick V, whom the Bohemians had elected king. After Frederick's defeat, however, Mansfeld entered his service and for two years succeeded in defending first the Upper Palatinate (1621) and later the Rhenish Palatinate against Tilly, who suffered a reverse at Wiesloch on April 27, 1622.

When Frederick was unable to maintain the expensive mercenaries, Mansfeld, in conjunction with Christian of Brunswick, led his army through Lorraine and Flanders, where he defeated a Spanish corps at Fleurus (Aug. 1622). Now in the employment of the Dutch, he made the Spaniards raise their siege of Bergen op

Zoom and, later in 1622, conquered East Frisia, which he held for the Dutch until 1624. He then went to London and obtained an army and money for the impending Danish war. While Christian IV of Denmark operated in Lower Saxony against Tilly, Mansfeld tried to block the northward march of the imperial army under Wallenstein at the crossing of the Elbe river near Dessau but was dislodged by Wallenstein (April 25, 1626). Undaunted, he raised a fresh army with French subsidies and marched through Silesia into Hungary, where he hoped to obtain the assistance of Gabriel Bethlen, prince of Transylvania, for an attack on Austria. Disappointed in this expectation and pursued by Wallenstein, Mansfeld turned to Venice as his paymaster but died on the way in a Bosnian village near Sarajevo on Nov. 29, 1626.

See J. Massarette, *La Vie martiale de Pierre-Ernest de Mansfeld*, 2 vol. (1931). (S. H. S.)

MANSFIELD, KATHERINE (pseudonym of KATHLEEN MANSFIELD BEAUCHAMP) (1888–1923), New Zealand writer who pioneered in the short story the "stream of consciousness" technique and evolved a distinctive prose style with many of the overtones of poetry, was born on Oct. 14, 1888, in Wellington, N.Z., which she left at the age of 19 to establish herself as a writer. Her initial disillusion appears in the ill-humoured stories collected in *In A German Pension* (1911). From then till 1914 she published stories in *Rhythm* and *The Blue Review*, edited by the critic and essayist John Middleton Murry (1889–1957), whom she married in 1918 after her divorce from George Bowden. The death of her soldier brother in 1915 shocked her into a recognition that she owed a "sacred debt" to him and to the "remembered places" of her native country. *The Aloe* (1916), later revised as *Prelude* (1918), was the beginning of a series of short stories beautifully evocative of her family memories of New Zealand. These, with others, were collected in *Bliss* (1920), which secured her reputation.

For the next two years she worked with intense concentration on her best work, and is seen at the height of her powers in *The Garden Party* (1922), which includes work of the calibre of "At the Bay," "The Voyage," "The Stranger" (with New Zealand settings) and the classic "The Daughters of the Late Colonel." Her final work (apart from unfinished material) was published posthumously in *The Dove's Nest* (1923) and *Something Childish* (1924). From her loose papers Murry edited the *Journal* (1927, rev. ed. 1954) and he also published with annotations her letters to him (1928, rev. ed. 1951). The last five years of her life were overshadowed by tuberculosis and despite visits to Switzerland, Italy and the south of France, she died near Fontainebleau on Jan. 9, 1923.

MANSFIELD, RICHARD (1854 or 1857–1907), U.S. actor, intense, somewhat eccentric, but unquestionably brilliant and one of the last of the great romantic stars, was born on May 24 in Berlin, where his mother, Erminia Rudersdorff, was engaged in a concert tour. His father, Maurice Mansfield, died when Richard was two, and Madame Rudersdorff and Richard spent the subsequent years in concert tours of England and the continent. In 1872 they arrived for the first time in New York city, where young Richard alternately turned to singing, painting and acting. Dissatisfied with his lack of accomplishment, he returned to England in 1877 and during the next six years achieved moderate success as a singer of light opera, principally of Gilbert and Sullivan. In the United States again in 1882, he turned to the spoken drama, attracting considerable attention as Baron Chevrial in *A Parisian Romance*. Through the next 20 years he continued to build his reputation in both England and the United States as an exciting, though frequently unpredictable, star. His chief roles were Jekyll and Hyde (1887), Richard III (1889), Beau Brummell (1890), Shylock (1893) and Cyrano (1898). In 1894 Mansfield produced *Arms and the Man* in New York, the first production of Shaw in America. In 1906 his *Peer Gynt* was a success in its Chicago opening, but, after moving it to New York and playing Peer and Baron Chevrial on the same day, Mansfield collapsed, physically and nervously exhausted. After a year's struggle to regain his

health, he died in New London, Conn., Aug. 30, 1907.

See Paul Wiltach, *Richard Mansfield, the Man and the Actor* (1908); William Winter, *Life and Art of Richard Mansfield*, 2 vol. (1910). (S. W. H.)

MANSFIELD, WILLIAM MURRAY, 1ST EARL OF (1705–1793), English judge, for 34 years chief justice of the king's bench, was born at Scone, in Perthshire, Scot., on March 2, 1705, the son of the 5th viscount Stormont. Only Sir Edward Coke and Sir Matthew Hale rivaled him as chief justice, parts of his work being published and becoming authoritative almost before he was off the bench. Subsequently, he three times procured position as a member of the cabinet, simultaneously getting the Great Seal (the chancellor's office) entrusted to a committee. Thus he retained the chief justiceship regardless of changes in administration but still exerted political power, a practice which later happily became unconstitutional. Educated at Perth grammar school, Westminster school and Christ Church college, Oxford, Mansfield was called to the bar at Lincoln's Inn in 1730. In Scotland he became famous by his appearance for the city of Edinburgh when it was threatened with disfranchisement for the affair of the Porteous mob, but his English practice remained scanty until in 1737 a single speech in one jury trial placed him at the head of the bar. In 1742 he was appointed solicitor general. In 1754 he became attorney general and acted as leader of the house of commons under the duke of Newcastle. In 1756 he claimed the chief justiceship of the king's bench and was made Baron Mansfield. In 1776 he was created earl of Mansfield. In 1783, during the coalition ministry, he declined cabinet office, but served as speaker of the house of lords. He resigned as chief justice in 1788 and died on March 20, 1793.

As must be the case with any court in central position, politics followed Mansfield to the bench. Three matters particularly reveal the man. After the burning of his house and precious library in 1780 in those "No Popery" riots, which involved mobs of 50,000 and invasion of parliament itself, Mansfield so fairly conducted the treason trial of the leader Lord George Gordon, that an acquittal resulted. In the Wilkes case (1768) he rose above both popular clamour and royal pressure by careful technical work on the precedents. This work developed legal flaws in the crown's case unknown to the defendant himself. Thus the Tory judge discharged an agitator because the Tory's own type of due process so required. The widespread view that Mansfield abolished slavery with one judicial decision, while it took a civil war in the United States, is, however, superstition. Mansfield sought, with all of his high tactical powers, to avoid any slavery issue: he was a property-minded man of commerce. Even the famous judgment in *Somerset's case* (1772) decided only that an escaping slave could not be forcibly removed from England to vengeance in a colony. This, as Benjamin Franklin rightly protested, meant no abolition of "a detestable commerce" or of slavery in the colonies—both encouraged by the British laws until statutory changes in 1807 and 1833. Indeed, no vital emotional issue can be settled—though it may be helped toward solution—by judicial decision. The Dred Scott case and the segregation cases make this clear.

Mansfield's permanent stamp upon Anglo-American law lies in commercial law. When he mounted the bench, two years before the start of that Seven Years War that riveted Britain's grasp upon America, India and international trade, the English law was land-centred and landbound in outlook and entrenched professional tradition. Reform was imperative. Mansfield's vision and ambition reached beyond following the continental model of a special body of rules for commerce and banking. He sought to make the international law of commerce not a separate branch but an integral part of the general law of England, both common law and equity, using the leverage thus gained to pry loose from feudalism whole blocks of other rules which had few or no direct commercial bearing. An important part of this brilliant venture succeeded.

In the area of bills of exchange (drafts), promissory notes and the then novel check, Mansfield, modeling on standard international practice, shaped the law in sweeping judgments, each typically canvassing the whole relevant situation and its reasons. *Heylyn v. Adamson* (1758) 2 Burrow 669 is an example. No

judge has ever surpassed him here. A second area involved fresh creation. Marine insurance, then a new industry, was centred in London and was a weapon of competition and cold war. Mansfield did not build here on 'models'; he created the entire discipline.

He was not always so successful. In *Pillans v. Van Mierop* (1765) 3 Burrow 1663, he made enforceable without consideration, i.e., roughly, without any bargained-for return, a merchant's (banker's) "confirmed credit" or promise to accept drafts drawn from abroad. This decision was viewed, though without good ground, as a flat attack on the whole doctrine of consideration, and that doctrine was reaffirmed in its entirety by the house of lords in *Rann v. Hughes* (1778) 7 T.R. 350, n. A second defeat was in his effort to make a document transferring land receive an interpretation according to plain intention, rather than have such intention frustrated by some technical rule giving unmeant effect to words. His decision on this, in *Perrin v. Blake*, was reversed in 1772 (one of six reversals during 32 years of active service). But he triumphed in his expansion of the idea that a man should turn back or turn over any value received by mistake or wrongdoing or otherwise under circumstances making it inequitable for him to retain it. The remedy was by a fictitious "promise" to pay over ("quasi-contract"; modernly, the fiction being discontinued: "restitution"). This decision involved not only a wide new range for remedy but, as in the case when the sum received on resale of another's goods was substituted for their arguable value, an important simplification and easing of the plaintiff's proof.

Despite his long tenure, the "father of commercial law" had almost no cases on the heart of modern commercial law: mercantile contracts for the sale of wares. But he had chosen to make commercial law and general law a single whole. When commercial sales cases did arise, they came, ironically, before judges who thought in terms of haystacks and of horses, and the central area of commercial law was for more than a century given a flavour of land and manure rather than of commerce.

MANSFIELD, a municipal borough (1891) of Nottinghamshire, Eng., lies on the river Maun, 14 mi. N. of Nottingham by road. Pop. (1961) 53,218. It is the chief town in Sherwood forest (q.v.), and the Forest courts were held in the old Moot hall (built in 1752) in a chamber known as the Swainmote. The annual Swainmote dinner to commemorate the Holyrood feast which always followed a sitting of the Forest court is still held. The parish church of SS. Peter and Paul dates back to Saxon times, but the main portion of the present church is early Norman. Remains of rock dwellings, which were in occupation up to the end of the 19th century, still exist. Mansfield is a thriving industrial centre exploiting the local coal resources, with many big commercial and industrial enterprises. Among the more important industries, apart from deep mining, are decorative tinware, hosiery, boot and shoe manufacture, nylon spinning, light engineering and the making of radio components, electronic equipment and plastics. Newstead abbey, ancestral home of the poet Lord Byron, lies 4 mi. S., and Hardwick hall, an Elizabethan mansion belonging to the duke of Devonshire, is about 6 mi. N.W. (A. C. SH.)

MANSFIELD, a city in north-central Ohio, U.S., the seat of Richland county, is almost equidistant between Cleveland and Columbus, about 75 mi. from each city. Situated on rolling land at the very edge of the Allegheny plateau, it was first surveyed by Gen. James Hedges in 1808, three years after Indian titles were removed by the treaty of Fort Industry. Named after Jared Mansfield, surveyor general of the United States, the town grew slowly until the advent of the Mansfield and Sandusky railroad (later part of the Baltimore and Ohio system) in 1846; the Pittsburgh, Fort Wayne and Chicago railway (ultimately part of the Pennsylvania system) in 1849; and the Atlantic and Great Western railway (later included in the Erie system) in 1863. Thereafter its growth was more rapid; the city became an important

manufacturing centre in the post-Civil War period. By the 1960s Mansfield's diversified industry embraced electric and gas appliances, tires and inner tubes, auto bodies, sheet steel, electric distribution equipment, plumbing fixtures, vitreous china and thermostats. Pop. (1965) 51,418; Mansfield standard metropolitan statistical area (Richland county, established 1966) 117,761. For comparative population figures see table in OHIO: *Population*.

Distinctive features of the community include the Kingwood Center, a 47-ac. horticultural and botanical garden; a War of 1812 log blockhouse; and a monument to John Chapman (Johnny Appleseed), who for nearly 20 years considered Richland county his home. The Malabar farm, established by novelist Louis Bromfield, is not far from the city. (P. R. S.)

MANSHIP, PAUL (1885-1966), U.S. sculptor, creator of the large bronze figure of Prometheus overlooking the Rockefeller Center plaza, in New York city, was born in St. Paul, Minn., on Dec. 25, 1885. After studying in St. Paul, Philadelphia and New York city, he won a scholarship in 1909 to the American academy in Rome. After three years abroad he settled in New York. Starting in 1913 with a prize from the National Academy of Design, his works continued to win awards. In their subjects and generalized style his statues are inspired by classical art. To a lesser degree he was influenced by the east, especially India. He developed a distinctive style remarkable for its simplified modeling and rhythmical patterns. Among his large decorative works, mostly in bronze, are "Dancer and Gazelles" (1916), of which there are versions in several museums; the Prometheus fountain (1934) in Rockefeller plaza; "Celestial Sphere" (1939); and the Woodrow Wilson memorial at the Palais des Nations, Geneva. Manship died in New York city on Jan. 31, 1966.

Manship executed many portraits in marble; most striking are "Pauline Frances—Three Weeks Old" (1914), Metropolitan Museum of Art, New York city, and "John D. Rockefeller" (1918), collection of John D. Rockefeller, Jr. His bronze "The Young Lincoln" is in Fort Wayne, Ind. Manship's delightful depictions of animals are much admired; particularly famous is the Paul J. Rainey memorial gateway at the Bronx zoo, New York city (1934).

See E. Murtha, *Paul Manship* (1957).

(M. I. B.)

MANSLAUGHTER, in Anglo-American criminal law, the unlawful killing of another human being, without malice, either express or implied. In the U.S., several states define by statute two kinds of manslaughter: voluntary, in which there is intent to produce the injury; and involuntary, in which there is no such intent. Other states recognize several distinct degrees of the crime. All these distinctions are purely statutory and do not enter into the common-law definition. For the distinction between manslaughter, murder and other forms of homicide, see **HOMICIDE**. (A. DM.)

MANSON, SIR PATRICK (1844-1922), British parasitologist, the first outstanding modern practitioner, teacher and research worker in the field of tropical medicine, was born in Scotland on Oct. 3, 1844. He practised medicine in Takao, Amoy and Hong Kong (1866-89), and thereafter in London until his death. He was elected fellow of the Royal society in 1900, knighted in 1903, created Knight Grand Cross of St. Michael and St. George in 1912, became first president of the Society of Tropical Medicine and Hygiene (1907-08) and was recipient of many medals and honorary degrees. He published several hundred scientific papers. He died on April 9, 1922.

Manson was first to discover (1877-79) that an insect (mosquito) can be host to a developing parasite (the worm *Filaria bancrofti*) of a human disease (filariasis). In 1894 he published his mosquito-malaria hypothesis, which led to the discovery by Ronald Ross (q.v.) that malaria, like filariasis, is a mosquito-transmitted disease. In 1898 Manson published a textbook on tropical diseases that, frequently revised, has been a standard ever since. In 1899 he organized the London School of Tropical Medicine.

See P. H. Manson-Bahr and A. Alcock, *The Life and Work of Sir Patrick Manson* (1927).

(P. F. R.)

MANSUR, AL-, throne name or honorific title assumed by several Muslim rulers, meaning "aided," or "rendered victorious [by God]." It is also used as an ordinary name. The best-known are discussed below.

ABU JA'FAR 'ABDULLAH AL-MANSUR (714-775), second Abbasid caliph (*see* CALIPHATE), who reigned from 754 to 775. Born in Aug. 714, the son of a Berber slave girl, he followed his brother Abu'l-Abbas al-Saffah on the throne. His main task was to secure the rule of the dynasty, which had come to power only in 750. So successful was he in this that he must be regarded as the real founder of the dynasty. First, with the help of Abu Muslim, he defeated his uncle Abdullah, governor of Syria, who disputed his succession. Then he had Abu Muslim treacherously murdered, since his power in Khurasan seemed to threaten the caliph's. Later, in 762-763, a Shi'ite rising in Mecca and Medina was ruthlessly crushed. Khurasan was pacified by the appointment in 759 of al-Mansur's son, known as al-Mahdi, as governor. The completion of the new capital at Baghdad in 766 was an outward mark of al-Mansur's success in pacifying the caliphate (apart from Spain) and firmly establishing Abbasid rule. The new capital also shows the shift of power eastward, since the Abbasids depended on the armies of Iraq and Khurasan. At the same time Persian traditions of government were followed more closely, and Persian Muslims had a greater share in the state. The Persian office of vizier was introduced, with a number of separate offices or ministries (*diwans*) subordinate to it. Al-Mansur died in Bir Maimun in Oct. 775 while on a pilgrimage to Mecca.

ABU TAHIR ISMA'IL IBN AL-QA'IM, third Fatimid caliph in north Africa, who reigned from 946 to 953.

ABU YUSUF YA'QUB AL-MANSUR, often called Jacob Almanzor, who ruled from 1184 to 1199 as prince of the Moorish dynasty of the Almohads (*q.v.*) in north Africa and Spain. He was the son of a Christian slave girl. The Giralda at Seville is a notable architectural monument of his reign. His defeat of Alfonso VIII of Castile at Alarcos (1196) is the culminating event of Almohad rule in Spain. Subsequently it rapidly declined.

MOHAMMED IBN ABI-AMIR AL-MANSUR, known to European writers as Almanzor, chief minister and virtual ruler of the Omayyad caliphate of Córdoba from 978 to his death in 1002. (*See* CÓRDOBA, CALIPHATE OF.) Descended from an Arab who took part in the conquest of Spain, he rose by his own skill, tact and efficiency. He had the support of Subh, the Basque mother of the young caliph Hisham II, and she was said to be his mistress. With his father-in-law, the general Ghalib, he overthrew the previous chief minister in 978. A rupture with Ghalib led to the latter's defeat and death in battle in 981. By giving the African territories local independence under Omayyad suzerainty, he stopped a drain on his resources. This and the replacement of the Slavs in the army by Berber and Christian mercenaries enabled him to conduct a series of successful campaigns against the Christian states of northern Spain, including one against Santiago in 997. From 981, when he assumed the honorific name of *al-Mansur bi-Allah* ("the one made victorious by God"), he had supreme power and gradually adopted various outward marks of it. Though in 994 he took the title of "Noble King" (*al-Malik al-Karim*), the caliph continued as nominal head of state. He died at Medinaceli on Aug. 10, 1002, on the way back from a campaign. His rise to power is comparable to that of the Buyids and Seljuks in the east. A son succeeded him, but the family, known as the Amirids, retained power for only a few years. (W. M. WT.)

MANSURAH, AL (EL MANSURA), a town of lower Egypt on the eastern side of the Damietta branch of the Nile. It is the capital of Ad Daqahliyah *muhafaza* (governorate) and is 90 mi. N. of Cairo and 34 mi. S.W. of Damietta. Pop. (1957) 136,057; (1962 est.) 159,000. It has rail connections with Az Zaqazig and Cairo and is a market centre for the cotton, flax and rice of the northeast delta. Its principal industries include cotton ginning, cottonseed oil extraction, rice milling and textile manufactures.

Al Mansurah was founded in A.D. 1221. The only event of importance in its history was the battle of the same name, when King Louis IX, who was leading a crusade to attack Islamic power in Egypt, was outmaneuvered by the Mamelukes and his forces decimated on Feb. 8, 1250. It was this battle that largely contributed to the ultimate defeat of the French expedition (*see* CRUSADES). The fort, called St. Louis after the French king, is still standing. (A. B. M.; M. V. S.-W.)

MANTEGNA, ANDREA (1431-1506), greatest north Italian fresco painter of the 15th century, was born at Isola di Cartura near Piazzola, Italy, in 1431 and was apprenticed by his father, a carpenter, to the Paduan painter Francesco Squarcione. In 1441 he is mentioned as Squarcione's adopted son. He seems to have remained in this painter's studio for six years, moving with Squarcione to Venice in 1446. By 1448, when at the age of 17 he signed a lost altarpiece for Sta. Sofia in Padua, he was an independent artist. Padua was the seat of the most prominent university in north Italy, and from a very early date Mantegna must have been indoctrinated with the humanist culture that formed the mainstay of his art. In addition, he would have become familiar with the work of the Florentine artists who had been employed in the church of S. Antonio, notably Fra Filippo Lippi and Donatello. The latter was resident in Padua after 1443 and exercised a profound influence on Mantegna's work. In Venice the frescoes of Andrea del Castagno in S. Zaccaria, the mosaics of Paolo Uccello and the personality of Jacopo Bellini must also have left their impression on his mind. These experiences are summed up in Mantegna's first major work, the frescoes in the Ovetari chapel of the church of the Eremitani in Padua.

Before this chapel was destroyed by bombing in 1944, it contained a cycle of frescoes covering the lateral walls and vault. The altar wall and the upper part of the apse behind. The commission owed its origin to the will of Antonio Ovetari and seems to have been allotted in the first instance to Squarcione, by whom the work was subcontracted to Antonio Vivarini and Giovanni d'Allemagna. On the one hand, and to Mantegna and Niccolò Pizzolo, on the other. Of the sections executed by Mantegna, the "Martyrdom and Removal of the Body of St. Christopher" (begun by Pizzolo) and an Assumption of the Virgin survive in part. The poles of Mantegna's development in the Ovetari chapel are the still tentative full-length saints painted in the apse and the masterly scenes on the base of the left wall, which belong to the last phase of work in the chapel, and were probably painted in 1456. Viewed solely from the standpoint of space projection, Mantegna's frescoes are the most progressive paintings of their time. Throughout the scenes the architecture is authentically classical and incorporates the rich archaeological detail that is a feature of Mantegna's mature work.

In Aug. 1453 Mantegna received the commission for a polyptych for the chapel of St. Luke in Sta. Giustina at Padua. This altarpiece, now in the Brera gallery in Milan, was completed in November of the following year and corresponds in style with the intermediate frescoes in the Ovetari chapel. The style of the latest of the frescoes is translated to the field of panel painting in an altarpiece commissioned for S. Zeno at Verona by Gregorio Correr, probably in 1456 (completed 1459). Inspired by Donatello's high altar in the Santo at Padua, the main panels represent, between four massive wooden columns, the Virgin and Child enthroned with four saints in an open hall. One of the richest and most brilliant of all north Italian altarpieces, the S. Zeno triptych now lacks its predella which is distributed between the Louvre ("Crucifixion") and the museum at Tours ("Agony in the Garden" and "Resurrection").

Before 1453 Mantegna married Nicolosia, daughter of Jacopo and sister of Giovanni Bellini. Mantegna's influence on Bellini is evident in a painting of the "Transfiguration" in the Museo Correr in Venice and certain other early works. A point of comparison between the two artists is afforded by two paintings of the "Agony in the Garden" in the National gallery, London, both of which derive from a drawing by Jacopo Bellini. Mantegna's classicizing figures are set in the same arid landscape as the Ovetari "Martyrdom of St. James," whereas in Bellini's panel this academic classicism is replaced by a warm romantic apprehension of nature and natural forms.

On Jan. 30, 1459, Mantegna was appointed court painter to Lodovico Gonzaga, marquess of Mantua, and he moved to Mantua later in the year. No dated work by him survives between this year and the completion of the frescoes in the Camera degli Sposi of the ducal palace at Mantua in 1474, though it is known that he executed paintings (lost) in the chapel of the ducal palace (still

THE CRUCIFIXION, CENTRE PREDELLA PANEL OF S. ZENO ALTARPIECE, BY ANDREA MANTEGNA. IN THE LOUVRE, PARIS

unfinished in 1464), in the castle of Goito and at Cavriana. In 1466-67 he visited Pisa and Florence. The commission for the Camera degli Sposi has been credibly assigned to the year 1472. The ceiling of the room is decorated with fictive reliefs of emperor heads and with triangular grisaille paintings of mythological scenes, also in imitation of the antique. In the centre is a circular aperture in which a number of figures are represented looking down over a balustrade. This detail forms a landmark in the history of illusionistic painting and was of fundamental importance for the illusionistic frescoes of Correggio. On the wall above the fireplace is a much damaged scene representing the court of Lodovico Gonzaga. There, too, the wall surface is treated illusionistically with consummate constructional resource. On the second of the two painted walls is a fresco of Lodovico Gonzaga and his son Cardinal Francesco (possibly in commemoration of the latter's visit to Mantua in 1472), a fragmentary fresco of two huntsmen and hounds and, above the doorway between them, a number of putti supporting a tablet recording the date of completion of the work.

The frescoes reveal Mantegna as a portrait painter of the first rank. Other examples of this aspect of his work are portraits of Cardinal Mezzarota (Kaiser Friedrich museum, Berlin), Cardinal Carlo de' Medici (Uffizi, Florence) and an unidentified man (National Gallery of Art, Washington, D.C.).

At this time Mantegna enjoyed a high reputation not only as an artist but as a connoisseur of the antique. His archaeological and epigraphic studies provide a context for the second of his great Mantuan commissions, that for nine canvases of the "Triumph of Caesar" (Hampton court, Middlesex). These were in course of execution in 1486 and were still unfinished in 1492. Gravely damaged as they are, they form one of the most significant monuments of 15th-century humanist art.

In 1488 Mantegna visited Rome to decorate a small chapel in the Vatican (destroyed) on the commission of Pope Innocent VIII and to execute *trompe-l'oeil* (illusionistic) paintings in the adjacent sacristy. Work in the Vatican interrupted the progress of the "Triumph of Caesar." In 1495, after the completion of the latter work, Mantegna began work on the "Madonna of the Victory" (Louvre, Paris), which was commissioned by Giovanni Francesco Gonzaga to commemorate his victory over the French at Fornovo and was installed in the Cappella della Vittoria (also designed by Mantegna) in 1496. The course of Mantegna's development in the last years of his life may be judged from two paintings of St. Sebastian, one in the Louvre (probably 1481) and the other in the Ca d'Oro in Venice (before 1506). His last important commission was for three allegorical paintings for the studio of Isabella d'Este in the ducal palace. Two of these are now in the Louvre. A third painting (later completed by Lorenzo Costa) was unfinished when Mantegna died on Sept. 13, 1506. He was buried in the church of S. Andrea, Mantua, in a funerary chapel of his own design.

In addition to these major works Mantegna was responsible for executing many smaller paintings. Among these is a notable series of Madonnas (Kaiser Friedrich museum, Berlin; Accademia Carrara, Bergamo; Museo Poldi-Pezzoli, Milan; Brera gallery, Milan), the form of which was clearly influenced by the Madonna reliefs of Donatello. Other paintings are a well-known panel of "St. George" in the Accademia in Venice, a triptych of the "Adoration of the Magi," "Presentation in the Temple" and "Ascension" in the Uffizi gallery, Florence, and a strongly foreshortened figure, the "Dead Christ," in the Brera gallery, Milan. After 1491 (and perhaps as early as 1475) Mantegna was active as an engraver. Seven engravings (four of them of classical subjects) are usually accepted as his work. Though Mantegna's work is less immediately appealing, because colder and more detached, than that of his contemporary and brother-in-law Giovanni Bellini, we are conscious in his paintings of the working of a powerful intelligence and of the presence of an inventive faculty richer than that of any other north Italian artist of his time. His late work, like Bellini's, bridges the transition to the 16th century and opens the way to a world of experience which was explored, in the decades following his death, by his disciple Correggio.

(J. W. P.-H.)

MANTELL, GIDEON ALGERNON (1790-1852), pioneer English geologist and paleontologist, noted as a discoverer and collector, was born at Lewes, Sussex. Educated for the medical profession, he practised at Lewes, Brighton and Clapham. He studied the paleontology of the Secondary (Mesozoic Era) rocks, particularly in Sussex—a region which he made classical in the history of discovery. His most remarkable discoveries were made in the Wealden formations. He demonstrated the fresh-water origin of the strata, and from them he brought to light and described the remarkable dinosaurian reptiles known as *Iguanodon*, *Hylaeosaurus*, *Pelorosaurus* and *Regnosaurus*. He also described the Triassic reptile *Telerpeton elginense*.

Mantell was elected a fellow of the Royal society in 1825 and died in London on Nov. 10, 1852.

MANTEUFFEL, EDWIN, FREIHERR VON (1809-1885), Prussian field marshal, a victorious general of the Bismarckian era who was also an able diplomat, was born at Dresden on Feb. 24, 1809. He joined the guard cavalry at Berlin in 1827 and won the complete confidence of King Frederick William IV during the revolutionary events of 1848 and became his aide-de-camp. Late in 1848 he was sent on a mission to Sweden. He became a lieutenant colonel in 1852 and was commander of the 5th Uhlans from 1853. In 1854 he went on two diplomatic missions to Vienna and one to St. Petersburg; on the latter mission he persuaded the emperor Nicholas I to withdraw Russia's troops from the Danubian principalities (see CRIMEAN WAR). He then went again to Vienna to dissuade Austria from joining the war against Russia. In Feb. 1857 he was appointed chief of the military cabinet, a body which then rivaled the general staff for control of Prussia's armed forces. In 1861 he was promoted lieutenant general.

After service in the war of 1864 against Denmark, Manteuffel was made governor of Schleswig. During the Seven Weeks' War (1866) he occupied Holstein, commanded a division in the campaign against the Hanoverians and in July succeeded E. Vogel von Falckenstein in command of the army of the Main. His operations ended with the occupation of Würzburg. He was then delegated to explain Prussia's German policy to the Russians.

In the Franco-German War (1870-71) Manteuffel led the I corps and distinguished himself at the battle of Colombey-Neuilly and in the repulse of Marshal A. Bazaine at Noisseville. Succeeding K. F. von Steinmetz as commander of the 1st army in Oct. 1870, he won the battle of Amiens (Nov. 27) and occupied Rouen (Dec. 6). Commander of the newly formed army of the south (Jan. 1871), he quickly liquidated the French forces in southern France. When this army was disbanded, he commanded the 2nd army. From June 1871 to Sept. 1873 he commanded the occupation forces in France—a duty that he performed with remarkable tact. He was then made a field marshal and military governor of

Berlin. On his return from a last mission to the Russians after the congress of Berlin (1878) he was imperial governor of Alsace-Lorraine from 1879. He died at Carlsbad in Bohemia on June 17, 1885.

MANTINEA (MANTINEIA), an ancient city of Arcadia, in Greece, about 8 mi. N. of modern Tripolis in a long narrow marshy plain bounded on the west by Mt. Mainalon, on the east by Mt. Artemision; it is without opening to the coast, the water percolating through underground passages (*katavothra*) to the sea. The supremacy of the district was disputed with Tegea (*q.v.*).

Mantineia is mentioned in the catalogue of ships in Homer's *Iliad*, but in early Greek times it was only a cluster of villages, insignificant compared with Tegea and submissive to Sparta. But soon after the Persian wars its five constituent villages, at the suggestion of Argos, were merged into one city, whose policy was henceforth guided by three main considerations: its democratic constitution of small freeholders; its ambition to control the watershed of the Alpheus (Alfios) river and Arcadian roads to the Isthmus of Corinth; and its chronic disputes with Tegea. In 468 B.C. the Mantineans alone of Arcadian townships refused to join the combination of Tegea and Argos against Sparta, and they assisted Sparta during the revolt of the Messenian helots of 464. Though formally on the same side in the Peloponnesian War, they employed the truce of 423 in fierce but indecisive war with Tegea. After the peace of Nicias (421) Mantinea allied with Elis, Argos and Athens, but this alliance was defeated by the Spartans at the battle of Mantinea (418) and dissolved. During the 4th century and Hellenistic period Mantinea was of less importance, and in the later Roman empire the city dwindled into a mere village (which from the 6th century bore the Slavonic name Goritza) and as a result of malaria and Turkish rule has disappeared. The site was excavated by the French school at Athens, in 1888. The agora and adjacent buildings and the walls have been investigated. When the city was rebuilt in 370 B.C., the Ophis river, which formerly ran through the town, was divided so as to encircle the walls.

Battles of Mantinea.—Battles were fought in the years 418, 362 and 207 B.C. at Mantinea.

1. The first battle, in the Peloponnesian War (*q.v.*), is of some interest in the evolution of tactics. On the one side were the Spartans under the Spartan king Agis, while the other was composed of Argives, Mantineans and a small Athenian force. As the Spartan line advanced, a drift to the right occurred—a common occurrence in ancient battles, due to the natural instinct of each man to hug closely to his neighbour's shield as a protection to his own unguarded (*i.e.*, nonshield-bearing) side. Agis, seeing that this drift would cause his left flank to be overlapped by the enemy, sought to prolong his left. This stretching caused a gap in the centre, and the Spartan left wing was broken up by its adversaries who poured into the gap. This, however, was offset by the success of the Spartan right.

2. The second and more justly famous battle took place in 362 B.C. Epaminondas had followed up the sensational Theban victory at Leuctra (*q.v.*) by invading the Peloponnese in 370 and 369. A surprise attack on Sparta had narrowly failed, but strong opposition against it had been built up. Messenia had been re-established as an independent state with a new capital, Messene, on Mt. Ithome, and a new federal capital had been designed at Megalopolis for the Arcadian league. The position of Epaminondas, however, was not secure and Theban policy lacked consistency. A serious division also broke out in the Arcadian league reviving the old hostility between Tegea and Mantinea.

In 362 Thebes was driven to choose between reasserting its authority and sacrificing its prestige. Its move against Arcadia caused Greece to divide afresh into two hostile coalitions. Once more Epaminondas made a surprise spring at Sparta, but he was deprived of the fruits of his night march through a deserter, who warned the Spartan main army in time for it to hurry back and safeguard the capital. Epaminondas then stood on guard at Tegea while the enemy forces concentrated at Mantinea. The valley in which these places lay is shaped like an hourglass by the surrounding mountain ranges, and at the mile-wide waist the Spartans and their allies took up a strong position. Epaminondas

determined to seek a decision by battle, and as in his strategy so in his grand tactics showed his art by an indirect approach.

At first he marched directly toward the Spartan camp, causing the enemy to form up in battle order facing his line of approach. But when still several miles distant, he suddenly changed direction to the left, turning in beneath a projecting spur. This surprise maneuver threatened to take in enfilade the Spartan right and to dislocate still further the Spartans' battle dispositions he halted his troops and made them ground arms as if to encamp. The deception succeeded; the enemy were induced to relax their battle order, allowing men to fall out and the horses to be unbridled. Meanwhile Epaminondas was actually completing his battle dispositions behind a screen of light troops.

Then, on a signal, the Theban army took up its arms and swept forward. Caught by surprise the enemy made haste to reform, but their cavalry were driven back by the Theban cavalry covering the left flank of the massed column, and this striking the Spartan line pierced it in two. But in the moment of decision Epaminondas himself was mortally wounded, and with his fall the advance came to a stop and failed to complete the victory.

3. The third battle for which Mantinea is notable was that of 207 B.C., in which Philopoemen, the commander of the forces of the Achaean league, routed Machanidas, tyrant of Sparta.

(B. H. L. H.; R. M.)
MANTIQUEIRA, SERRA DA, a range of mountains in southeastern Brazil, running for about 200 mi. in a southwest-northeast direction along the southern border of the state of Minas Gerais. The range comes to a distinct ending west of Juiz de Fora and does not connect with the Serra do Espinhaço as was formerly thought. It rises abruptly from the northwest side of the Paraíba valley, reaching a height of 9,482 ft. in Pontao da Bandeira.

The mountains were originally forest-covered except for the tops which stand above the tree line. They provide charcoal and pasture for cattle; on the lower slopes there are several health resorts, such as Campos do Jordão.

(P. E. J.)
MANTIS (MANTID), any insect belonging to the superfamily Mantoidea (including Mantidae and related families), sometimes grouped with cockroaches in the order Dictyoptera but, by some given ordinal rank of its own as the Mantoidea (Mantodea). Formerly, mantids were placed in the order Orthoptera (*q.v.*).

The name mantis, meaning "a diviner," was used by the ancient Greeks for the common southern European *Mantis religiosa*, which they believed had supernatural powers; one of its present-day English names, "soothsayer," recalls that belief. Numerous legends and superstitions are attributed to the mantis because of its habit of remaining motionless or of swaying gently back and forth, with head raised and front legs outstretched in what appears to be an attitude of supplication. The scientific name, the common English name, praying mantis, and many other vernacular names, like *Gottesanbeterin* (German), *Prie-Dieu* (French), *Prega-Diu* (Provençal), together with similar names for other species, such as the West Indian "god-horse," all suggest piety. "Devil's horse" and "mule killer," among several names current in the United States, are perhaps more appropriate, since all mantids are ferocious carnivores and not at all of saintly demeanour; "preying" rather than "praying" is a more apt epithet for the mantis.

Most mantids live among vegetation, although some live directly on the ground. Almost all are camouflaged, and many bear remarkable resemblances to green or brown foliage. Some may be readily mistaken for withered, dried-up leaves, slender twigs, lichen, brightly coloured flowers or even ants. These adaptations, which provide them concealment from foes, also render them inconspicuous as they stalk or lie in wait for victims. Most species are comparatively slow-moving, but some ground forms can move

rapidly when pursuing prey. The front leg of a mantid is peculiarly modified: the tibia fits into a groove in the femur, forming a structure like a clasp knife, usually beset with spines. With these formidable weapons, a mantid can seize its prey in a viselike grip and hold it firm while tearing it apart with its mandibles. Mantids are voracious and very pugnacious, attacking and devouring not only noxious and venomous insects but even their own kind. When alarmed they adopt a "threatening" attitude, raising and rustling their wings (if any), often displaying bright "warning" coloration.

Mating may be a hazardous undertaking for the male mantid, for it frequently terminates in his sudden demise at the hand of his usually larger spouse. Eggs are laid in large cocoonlike capsules (*oothecae*) that serve as protection during winter or drought and from enemies. The nymphs all emerge about the same time, and, if they do not disperse rapidly, often indulge in cannibalism. The young closely resemble their parents, but lack wings.

The vast majority of the more than 1,500 species of mantids are tropical or subtropical. Only about a score occur in Europe and about the same number in North America, in both cases mainly in the south. Representative European genera are *Mantis* (*M. religiosa* being the most widespread), *Ameles*, *Iris* and *Empusa*; North American genera include *Stagmomantis* (*S. carolina* being very widely distributed), *Litaneutria* (*L. minor* being a small western species and the only native mantid in Canada) and *Thespertia* and *Oligomicella* (very slender southern forms). Two European and two Asiatic species have been introduced into North America. They are: *M. religiosa*, in northeastern United States and southeastern Canada; *Iris oratoria*, in California; the narrow-winged *Tenodera angustipennis*, in southeastern United States; and *T. aridifolia sinensis*. This last species, the familiar Chinese mantis, native in many parts of eastern Asia, is the largest mantid in North America, where it is most plentiful in the east but occurs as far west as Illinois and is found in California. Egg masses are sometimes sold by dealers to naturalists and gardeners to supply mantids to reduce insect pests; however, there is little evidence that mantids could ever become really effective in biological control.

See A. B. Gurney, "Praying Mantids of the United States," *Smithsonian Report for 1950*, pp. 339-362 (1951). (D. K. McE. K.)

MANTIS FLY (MANTID FLY), insects of the family Mantispidae, order Neuroptera, related to the ant lions, lacewing flies, etc., and named from their superficial resemblance to a mantis (*q.v.*) because of the length of the prothorax and the shape and prehensorial nature of the anterior legs.

The larva, at first very active and having well-developed legs (campodeiform), makes its way into the egg case of a spider or the nest of a wasp to feed on the eggs or young. Subsequently it changes into a fat grub with short legs. When full grown it spins a silken cocoon in which it transforms into the pupa. Mantispids are widely distributed in both the old and new worlds, but occur chiefly in warm countries. See NEUROPTERA; INSECT.

MANTO ("prophetess"), in Greek epic legends the daughter and assistant of the Theban prophet Tiresias (*q.v.*). After the sack of Thebes by the Epigoni (see SEVEN AGAINST THEBES) she was dedicated to Apollo at his oracular shrine of Delphi as the fairest of the spoil. Fulfilling an utterance of the oracle she married Rhacius the Cretan and founded in Ionia the famous Apolline oracle centre of Claros. Her son was the seer Mopsus (*q.v.*). See also ORACLE. (H. W. PA.)

MANTRA, a Sanskrit word meaning a sacred utterance considered to possess supernatural power. In the Vedic period the *mantras* are the words used in the ritual, especially the verses of the Vedic hymns; many are prayers or invocations of deities, but the texts emphasize their magical potency and symbolic interpretation. The cognate Iranian word denotes scriptural verses as well as magic spells to heal disease.

In post-Vedic India, *mantras* were particularly important in religious movements such as Tantrism (*q.v.*). While often considered as purely mechanical magic to obtain worldly ends or religious salvation, they were also the subject of more sophisticated speculations. Thus the sacred syllable *OM*, analyzed into the three sounds A, U and M, came gradually in the Upanishads and the Brahmanas to symbolize the Vedas, the components of the universe (earth, atmosphere and air) and, taken as a whole, the Absolute. The constant repetition (*japa*) of *mantras* was utilized to concentrate the mind on an object of religious meditation; and the *bija*- ("seed-") *mantra* of a deity was considered to evoke the presence of that deity. The famous Gayatri mantra (Rigveda, iii, 62, 10), an invocation to the sun-god Savitar, was formally transmitted to the young Brahman when he was invested with the sacred thread (see HINDUISM; *Social and Ethical Aspects*). The reception of a secret *mantra* from the teacher was normally a central feature of initiation into a religious sect. *Mantras* still play an important part in Hindu ritual.

Mantras were also luxuriant in popular Buddhism, especially as an aspect of the Mahayana, where this development has been called *mantrayana*. The normal Buddhist term for a formula of this type is *dharaṇī*, and numerous specimens survive in the literature. In the modern period, the use of the "six-syllable *mantra*"—*om mani padme hum*—is a feature of Tibetan Buddhism.

MANTRAP, a mechanical device for catching or injuring a trespasser. Such traps include concealed pits, traps with jaws that close on the victim's leg, and spring guns, triggered when one steps on a concealed wire. Since 1827 their use in England has been a misdemeanour, except to protect dwellings between sunset and sunrise.

In the United States, a number of states have banned the use of such devices. In jurisdictions that have not outlawed them, the law is far from settled, but it appears that the trap setter may be both criminally and civilly liable for resulting death or injury and that liability may depend on whether the victim was bent on committing a felony, a circumstance which is hardly predictable in advance. Thus it appears that one who sets such a trap may be imposing as grave a risk on himself as on the potential intruder.

(H. L. PR.)

MANTUA (Italian MANTOVA), chief town of the province of Mantova, Lombardy region, Italy, is located 40 km. (25 mi.) S.W. of Verona and 121 km. (75 mi.) E. of Milan. Pop. (1961) 64,202. Mantua stands on rising ground in a zone of lakes formed by the waters of the Mincio. Its fortifications were dismantled after 1866. It is divided in a north-south direction by the embankment of the Porta Molina and in an east-west direction by a long bridge on which runs the road to Padua. At the highest point of the city stands the cathedral, the interior of which was constructed after designs by Giulio Romano. The church of S. Andrea, which shares the privileges of the cathedral, was built according to plans by Leon Battista Alberti. It has a single nave without aisles and with barrel vaulting. The campanile, in brick, dates from 1414. The dome was added later (1732-82) after a design by Filippo Juvarra. The vast ducal palace, also called the Reggia dei Gonzaga, in the Piazza Sordello was begun c. 1302 by Guido Bonacolsi, but many of its apartments were added later and were decorated by Romano and his pupils. In the apartments of the empress are tapestries executed from cartoons of Raphael. The court castle, built (1395-1406) by Bartolino da Novara, contains the Camera degli Sposi, decorated with frescoes by Andrea Mantegna (*q.v.*). The Palazzo del Te, another work of Romano, on the boundary of the city, was built between 1525 and 1535 and is decorated with frescoes by Romano and his pupils and with stuccoes by Primaticcio. Other notable buildings include the

Palazzo della Ragione (13th–15th century); the Rotonda di S. Lorenzo (11th century, restored); the church of S. Sebastiano by Alberti (15th century); and the houses of Mantegna and Romano.

Among the cultural institutions of the city are the Accademia Virgiliana, which occupies a handsome edifice by Giuseppe Piermarini containing a Teatro Scientifico designed by Antonio Bibiena (1769); the communal library, founded in 1779 by the empress Maria Theresa and containing valuable incunabula and manuscripts; and the Archivio di Stato in which are kept the documents of the Archivio Gonzaga.

The economic activities of the city are primarily concerned with the processing and shipping of agricultural products. After World War II, however, industry increased, and an industrial area covers a large tract southwest of the city. As a result, the population grew rapidly, and large housing estates have given a new aspect to the city's outskirts. Mantua is a centre of road, rail and water transportation.

The city originated in settlements of the Etruscans and later of the Gallic Cenomani. Roman colonization began about 220 B.C. and in 70 B.C. the great Latin poet Virgil was born in the neighbourhood. In the 11th century the city became a fief of Boniface of Canossa, marquis of Tuscany. After the death of Matilda of Tuscany in 1115, Mantua secured a communal government which lasted until 1276, when the Bonacolsi (*q.v.*) family obtained control. They, in turn, were driven out in 1328 by Luigi Gonzaga, who established the supremacy of the Gonzaga (*q.v.*) family, under whom Mantua enjoyed a period of political prestige and cultural splendour. Following the downfall of the Gonzagas, in 1708, Mantua became a fief of the empire. In 1797, after a long siege, it was occupied by Napoleon. Returned to Austria by the congress of Vienna, it contributed to the cause of the Risorgimento and, after a plebiscite, was joined to the kingdom of Italy in 1866.

(EM. F.)

MANU, in ancient Indian mythology, the first of mankind and the supposititious author of an important Sanskrit treatise on law, the *Manu Smṛiti*. The name means simply "man" and is cognate with the Germanic word. A further and intrinsically improbable etymological connection with the verb *man-*, "to think," has sometimes been suggested. *Manu* has also been compared with that *Mannus* whom the Germans, according to Tacitus, considered to be the founder of their race. "*Manu*" may thus reflect an ancient Indo-European tradition, although the possibility remains open that *Mannus* was a parallel but independent development, as in the case of the Hebrew *Adam* (also meaning "man"), where a direct historical connection could hardly be suggested.

Manu appears in the Vedic hymns as the first sacrificer, to whom the gods gave fire for the sacrifice, and he is occasionally referred to as "father *Manu*." The *Shatapatha Brahmana* recounts how he was warned by a fish to which he had done a kindness that a flood would destroy the whole of mankind. He therefore built a boat, as the fish advised; and when the flood came he tied this boat to the fish's horn and was safely steered to a resting place on a mountaintop. When the flood receded, *Manu*, the sole survivor of mankind, performed a sacrifice, pouring oblations of butter and sour milk into the waters; and after a year there was born from the waters a woman who announced herself as "the daughter of *Manu*." These two then became the ancestors of a new mankind to replenish the earth. In the *Mahabharata* the fish in this story is identified with the god *Brahma*, while in the *Puranas* it was assimilated to the fish incarnation of *Vishnu*. (See also FLOOD [IN RELIGION AND MYTH].)

In the exuberant cosmological speculations of later Hinduism, as expounded in the *Puranas* and in the *Manu Smṛiti* itself, there were said to be 14 *Manus*, a separate one for each of the 14 subsidiary cosmic periods within the great time cycle (*kalpa*) of 4,320,000,000 years. A new human race is produced for each of these "*Manu intervals*" (*manvantara*), our own being the seventh in the current cycle. After the 14th *Manu* interval the whole universe comes to an end and is succeeded after an enormous length of time by a new creation in an endless series of creations and dissolutions.

The *Manu Smṛiti* (the "Laws" or "Code of *Manu*"), more

formally called the *Manava Dharma Shastra*, is among the earliest of the post-Vedic metrical treatises on legal and allied topics. Of uncertain date, it has been provisionally ascribed to the period between the 2nd century B.C. and the 2nd century A.D. In addition to an outline of civil and criminal law, the text discusses at length the four traditional stages (*ashrama*) of a Brahman's life—student, married householder, hermit and finally homeless ascetic; the four social classes (*varna*) which form the theoretical basis of the caste system (see CASTE [INDIAN]); the theory of "mixed castes," their origin and duties; the duties of a king; rules for sacrifices, penances and other religious duties. The work is thus a valuable source of information on the classical theory of Brahmanical Hinduism as a social system. See also SANSKRIT LITERATURE.

See Eng. trans. by G. Bühler, "The Laws of *Manu*," *Sacred Books of the East* (1886).

MANUCODE, the common name given to the more somber coloured birds of paradise (*q.v.*) comprising the genus *Manucodia* and found in northern Queensland and New Guinea. The males resemble the females and help them with nesting duties; for these and other reasons manucodes are often regarded as an early group in the family Paradiseidae.

MANUEL I (MANUEL COMNENUS) (c. 1120–1180), Byzantine emperor from 1143 to 1180, the fourth son of John II and his Hungarian wife, was married first to Bertha of Sulzbach in 1146, and then in 1161 to Mary of Antioch. He was therefore well used to westerners, and his partiality for Latins has led to the suggestion that he may have deliberately tried to break down barriers between east and west. His opening policy was sound: he safeguarded his position against the Danishmends and Seljuks in Asia Minor and renewed his alliances in the west against his Norman rivals in both Sicily and Antioch. At the time of the second crusade he defended his Greek territory from Roger of Sicily whose fleet captured Corfu in 1147. This was retaken in 1149 with Venetian aid, and at the treaty of Thessalonica in 1148 Manuel consolidated his alliance with Conrad III of Germany who was returning from the second crusade. Manuel wished to re-establish Byzantine authority in Italy and he gained a foothold in southern Italy in 1155. But Roger II's successor William I of Sicily defeated the Byzantines at Brindisi in 1156, and in 1158 Manuel signed a 30-years' peace with him and withdrew his troops from Italy. After 1158 Manuel concentrated on diplomacy in Italy rather than direct military intervention. In Conrad III's successor, Frederick Barbarossa, he had a powerful opponent, but though he tried to exploit the rift between Frederick and the papacy he did not shut the door to a German alliance. He also kept open the possibility of an understanding with Sicily, whose king from 1166 onward was the young William II, while constant embassies attempted to secure papal support in return for ecclesiastical reunion. Byzantine gold was freely scattered in Italian cities, and Venice, Pisa and Genoa secured substantial trading privileges within the Byzantine empire. But Greek resentment of Venetian privilege and arrogance was shown by the Byzantine attack of 1171 on Venetian merchants throughout the empire.

In the Balkans Manuel defeated Stephen Nemanya of Rascia in 1172 and forced him to recognize his suzerainty. He maintained close relations with Hungary whose heir-apparent, Bela, was married to his daughter and heiress Mary, and regarded as Bela's successor. Croatia, Sirmium and Dalmatia were ceded as Bela's appanage. But with the birth of Manuel's son Alexius in 1169 the marriage was dissolved, though when Bela succeeded to the throne of Hungary in 1173 his appanage lands were retained by Manuel.

On the eastern frontier Manuel gained some successes in Cilicia and Antioch, and in 1159 Raymund of Antioch submitted to Byzantine overlordship. Manuel also allied with Nureddin of Aleppo who was threatening the crusading position. But rising forces in the Muslim world, particularly Nureddin's commander Saladin in Egypt, remained victorious. The joint Greek and Latin siege of Damietta in 1169 failed. In Asia Minor Kilij Arslan II of Iconium had considerably strengthened his position. From 1174 onward Manuel attempted to counter this and he persistently re-

refused to renew his peace treaty with Iconium. In 1176 he was trapped and defeated at Myriocephalum, and though Kilij Arslan did not press home his victory Byzantine prestige suffered a crushing blow. In spite of successes in Cilicia and northern Syria Manuel's foreign policy was too ambitious to be sustained. His home policy, though in many respects traditional, yet bears the marks of his original personality, particularly in his use of westerners. He died on Sept. 24, 1180, and was succeeded by a minor, Alexius II, his son by Mary of Antioch.

MANUEL II (MANUEL PALAEOLOGUS) (1350–1425), Byzantine emperor from 1391 to 1425, was the second son of John V, who allotted him the principality of Thessalonica before making him co-emperor in 1373, and with whom he was imprisoned by his elder brother Andronicus IV in 1376. After his father recovered his throne in 1379, Manuel reigned as emperor in Thessalonica (1382–87); and in 1390 he deposed his nephew John VII who had seized the throne. When his father died in 1391 Manuel was living in custody at the court of the Ottoman sultan Bayazid I, but escaped to Constantinople, where he was crowned emperor. Bayazid retaliated by laying siege to the city for seven months. Manuel submitted to the payment of tribute, and ruled his capital only at the sultan's mercy. The crusade organized for its relief by Sigismund of Hungary was routed by the Turks at Nicopolis in 1396; and in Dec. 1399 Manuel set out for the west to beg for help, visiting Italy, England and France, where he stayed nearly two years. He returned with little but promises; but Bayazid had meanwhile been defeated by the Mongol Timur at Ankara in July 1402. The Ottoman empire dissolved in civil war, until Mohammed I, prudently supported by Manuel, triumphed over his rivals. During Mohammed's reign (1413–1421) Manuel was thus left in peace; and he took the opportunity to improve the administration of his empire and its surviving outposts by visiting Thessalonica and the Morea, which he fortified with a wall across the Isthmus of Corinth. But his last respite ended with the accession of Murad II, who laid siege to Constantinople in 1422. The Morea was again overrun by the Turks; and Thessalonica, in imminent danger of conquest, was sold to the Venetians by Manuel's son Andronicus. In 1424 Manuel was forced to pay tribute to the sultan once more; he died as a monk on July 21, 1425.

Manuel was an intelligent ruler, but with the meagre resources of his shrunken and enfeebled empire he was unable to take advantage of the misfortunes of his enemies. He was a patron of art and letters, and himself composed theological, rhetorical and poetical works; and his correspondence is of considerable historical interest.

MANUEL I (1469–1521), king of Portugal from 1495 to 1521, was born at Alcochete on May 31, 1469, the younger son of Fernando, duque de Viseu, and the grandson of King Edward (Duarte). Manuel's elder brother, Diogo, duque de Viseu, was killed by his cousin and brother-in-law John II (q.v.) in 1484, so that John's only legitimate son, Alfonso, having died in 1491, Manuel succeeded to the throne at John's death (Oct. 25, 1495). Manuel's reign was characterized by religious troubles, by a policy of clever neutrality in the face of quarrels between France and Spain and by the continuation of overseas expansion. Manuel sought to influence Castilian policy and this explains his successive marriages, first to the daughters of Ferdinand and Isabella, Isabella (d. 1498) and Maria (d. 1517), and then (1518) to Eleanor, sister of the emperor Charles V. His marriage to Isabella was made conditional upon the adoption of a repressive

religious policy and resulted in an order (1497) for the expulsion of all Moors and of all Jews refusing baptism. Overseas, there were important new discoveries including the sea passage to India via the Cape of Good Hope by Vasco da Gama (1497–98) and Brazil (1500), but the most notable feature of the reign was the establishment of Portuguese influence in India and the far east—largely the work of Afonso de Albuquerque (q.v.; see PORTUGAL: History). Manuel died on Dec. 13, 1521, and was succeeded by John III, his eldest son by his second marriage. By his first wife Manuel had one son, Miguel da Paz (1498–1500), who was recognized during his brief life as heir to Portugal, Castile and Aragon; by his second wife he had six sons and three daughters; and by his third wife, one son and one daughter. (DA. A. P.)

MANUEL II (1889–1932), king of Portugal from 1908 to 1910, was born at Lisbon on Nov. 15, 1889, the younger son of Carlos I and Marie Amélie of Orléans. On the assassination of Carlos and the crown prince, Luís Filipe, on Feb. 1, 1908, Dom Manuel succeeded to the throne, but retained it only until Oct. 5, 1910, when the overthrow of the monarchy was proclaimed (see PORTUGAL: History). He took refuge in England and settled at Twickenham. He became a popular figure in English society. On Sept. 4, 1913, he married, at Sigmaringen, Augusta Victoria, daughter of Prince Wilhelm of Hohenzollern. There were no children. In exile, Dom Manuel devoted himself to bibliography and wrote a monumental three-volume description of his rich library, *Early Portuguese Books, 1489–1600, in the Library of His Majesty the King of Portugal* (1929–35). He died at Twickenham on July 2, 1932. He left the bulk of his estate to the Portuguese nation. (M. CA.)

MANUEL, NIKLAUS, sometimes erroneously called DEUTSCH (1484–1530), Swiss painter, soldier, writer and statesman, was born at Bern in 1484 and died there on April 28, 1530. He was *un uomo universale* and a great Swiss representative of the ideas of the Italian and German Renaissance and the Reformation. What he saw in Albrecht Dürer's and Hans Baldung's art and in northern Italy prompted him to use new forms of expression (instead of the prevailing late-medieval style) in his drawings, portraits and mythological and biblical paintings, most of which were done between 1515 and 1520. A self-assured, impulsive temperament permeates also his vigorous, polemic anticlerical writings (mainly plays, written 1522–26). Later he spent his energies in political activities as a member of the Bern city councils. His paintings included the "Dance of Death" in the Dominican monastery, Bern (1516–19, destroyed 1660), "Pyramus und Thisbe" and "Enthauptung Johannes des Täufers." Among his literary works are *Der Ablasskrämer* (1526), *Testament der Messe* (1528) and *Fastnachtsspiele* (1540). His *Sämtliche Dichtungen*, edited by J. Bächtold, appeared in 1878.

MANUEL DE MELLO, DOM FRANCISCO: see MELO, FRANCISCO MANUEL DE.

MANUL (*Felis manul*), often called Pallas's cat, a small desert and rock-dwelling wild cat, ranging from Tibet to Siberia. The coat is long and soft, of pale silvery gray or light buff, marked with black. It has been suggested that the high-set eyes and low-set ears are adaptations for peering over rocky ledges; the supposition is that the manul thus exposes the smallest portion of himself to his prey, small mammals and birds. See also CAT.

MANURES: see FERTILIZERS AND MANURES.

MANUTIUS, the Latin name of an Italian family (Mannucci, Manuzio), famous in the history of printing as organizers of the Aldine press.

ALDUS MANUTIUS (1449–1515) was born at Bassiano, south-east of Rome. He studied at Rome and Ferrara before going, in 1482, to Miranda with his friend, Giovanni Pico, whose nephew, Alberto Pio, prince of Carpi, gave Aldus money to start a printing press. He reached Venice in 1490, and gathered around him Greek scholars and composers, while Greek was the language of his household. In March 1494/95 he issued his first dated book,

the *Erotemata* of Constantine Lascaris. During 1495–98 Aldus printed five volumes of Aristotle; in 1495 the *Idylls* of Theocritus and Pietro Bembo's *De Aetna*; in 1498 Aristophanes and Politian. Francesco da Bologna acted as type cutter for him, designing his italic and cursive Greek. Traces of the new italic occur in the *Letters* of St. Catharine of Siena in Sept. 1500, but its first regular appearance is in the Virgil of 1501. In 1499 came Aldus' most famous book, the *Hypnerotomachia Poliphili* of Francesco Colonna, with its wonderful woodcuts by an unknown artist. In 1501 he printed Juvenal, Martial and Petrararch's *Cose volgari*; in 1502 Catullus, Lucan, Thucydides, Sophocles and Herodotus; in August 1502 the *Divina Commedia* of Dante first shows the famous device of the Aldine anchor. In the Sophocles of 1502 occurs the first mention of an Aldine academy, whose members had to speak Greek. In 1503 Aldus printed Xenophon's *Hellenica*, Lucian and Euripides; in 1504 Demosthenes and Homer; in 1505 Aesop, Bembo's *Gli Asolani*, Giovanni Pontano and Virgil; in 1508 Erasmus' *Adagia*, in 1509 Horace; in 1513 Pindar and Plato; in 1514 Hesychius, Athenaeus, Jacopo Sannazaro's *Arcadia* and Petrararch's *Canzoniere*. He apparently printed nothing in 1506, 1510 and 1511; during the struggle of Venice with the allied powers of Europe, Aldus' labours were suspended and he traveled to Ferrara and Mantua. In 1505 he married Maria Torresani, daughter of a printer, and had five children. Thereafter his father-in-law's name (Andrea Torresani di Asola) regularly appears with his in imprints. Aldus published three catalogues of his own books, in 1498, 1503 and 1513 (all photographically reissued by H. Omont in 1892). He died in Venice on Feb. 6, 1515.

PAULUS MANUTIUS (1512–1574) was born at Venice on June 12, 1512. After the death of Aldus, his brothers-in-law, the Asolani, carried on the Aldine press, until his third son, Paolo, took it over in 1533. The Asolani attempted the duties of editing, and, to reserve the honours for themselves, dispensed with the services of competent collaborators. As a result, some of their editions, notably their Aeschylus of 1518, are particularly bad. Paolo, determined to remedy this situation, separated from his uncles in 1540. He was himself an excellent Latinist, especially dedicated to Cicero; he issued corrected editions of Cicero's letters and orations, his own Latin version of Demosthenes (1554), his epistles in a Ciceronian style (1560), and his four treatises on Roman antiquities. From 1558 he directed a press for the Accademia Veneta, but this had to close down for lack of funds in 1561, when Paolo was invited by Pius IV to Rome and was offered a yearly stipend of 500 ducats. In Rome Paolo printed about 50 books before 1571, the profits being divided between himself and the Apostolic Camera. He died in Rome on April 6, 1574.

ALDUS MANUTIUS, JUNIOR (1547–1597), eldest son of Paolo, was born at Venice on Feb. 13, 1547. When only 14 he wrote a work on Latin spelling, *Orthographiae ratio*. Remaining in Venice to superintend the Aldine press after his father's move to Rome, he published in 1575 his *Epitome orthographiae* and in 1576 his commentary on Horace's *Ars poetica*. About the same time he was appointed professor of literature to the Cancelleria at Venice. In 1585 Aldus moved to Bologna, where in 1586 he published his life of Cosimo dei Medici; in 1587 he went to Pisa, and in 1588 Sixtus V called him to Rome. Aldus married a daughter of the publisher Bernardo Giunta. He died in Rome on Oct. 28, 1597, leaving children, but none who carried on the Aldine press.

It is probable that the Aldine family in 100 years (1495–1595) printed 1,000 editions.

MANWARING, ROBERT (fl. 1760), English 18th-century furniture designer and cabinetmaker. The dates of his birth and death are unknown. He was a contemporary, imitator and rival of Thomas Chippendale (*q.v.*). His work shows the same surprising variations of quality characteristic of that of nearly all the English cabinetmakers of the second half of the 18th century. His

best had an undeniable elegance, his worst was squat and ill-proportioned. He introduced the small bracket between the front rail of the seat and the top of the chair leg, or at all events made such constant use of it that it has come to be regarded as characteristic of his work. Among Manwaring's writings were *The Cabinet and Chair Makers' Real Friend and Companion, or the Whole System of Chairmaking Made Plain and Easy* (1765, reissued, 1937); *The Carpenters' Compleat Guide to Gothic Railing* (1765), and *The Chair-makers' Guide* (1766).

MANX LANGUAGE: see CELTIC LANGUAGES.

MANX LITERATURE. Printed literature in Manx is very limited and there is little evidence for the former existence of a rich oral literature in the Isle of Man. The first written text in the language is the translation of the Book of Common Prayer by a Welshman, John Phillips, bishop of Sodor and Man (1605–1633), completed by 1610, which survives in a unique manuscript of c. 1630, from which it was printed in 1893–94 (Manx society vol. 32–33). This work seems to have been spurned by the clergy because of its unfamiliar spelling. A catechism, as he called it, *Principles and Duties of Christianity . . .* by Thomas Wilson, bishop of Sodor and Man (1698–1755), in Manx *Coyrle Sodjeh*, was translated and printed in 1707, and he set on foot a scheme for the translation of the Bible, which was completed by his successor, Bishop Mark Hildesley (1755–1772). St. Matthew's Gospel appeared in 1748, and the four Gospels, and Acts, in 1763 and Epistles and Revelation in 1767. Meanwhile the clergy of the island were working on the Old Testament, which together with the New, appeared during 1771–75. A new version of the Prayer Book, replacing the extempore translations in use since Bishop Phillips' time, was produced in 1765. In most of these books the translators were either insufficiently expert or had too high a respect for the English original consistently to produce fully free and idiomatic renderings. Besides this published material the Manx Museum library contains more than 450 manuscript sermons dating from 1725 to 1850. Thomas Christian's abridgment of *Paradise Lost* (4,000 lines) appeared in 1796 (reissued for the Manx society, vol. 20, 1872).

Original compositions in Manx are in bulk much slighter. The Traditionary (or Manannan) ballad, purporting to give a digest of the history of the island, is known in manuscripts only from c. 1770, in print certainly only from 1802, but there seems to be good linguistic evidence for believing that it was composed early in the 16th century. *Baase Illum Dhoun*, a ballad on the death of William Christian (*q.v.*), who was executed in 1663, cannot have been written until a generation later since it refers to the fate of his accusers' families. It is first known from its revival with additional verses, in 1781. A trace of the heroic tradition survives in the *Fin as Osshin* fragment, a ballad on an Ossianic theme, recovered from oral tradition in the mid-18th century under the stimulus of the Ossianic controversy (see MACPHERSON, JAMES). The main bulk of the verse in Manx is in the form of carvals, or carols, songs in various metres on religious subjects, not all connected with Christmas (the Fall and Redemption of Man being a favourite theme) and composed to be sung at the *Oie'l Verree*, the Christmas eve service. These are often of considerable length.

MANYCH, a system of rivers and lakes in the Russian Soviet Federated Socialist Republic. U.S.S.R., extends northwest of the Caucasus mountains. The Western (*Zapadny*) Manych is 261 km. (162 mi.) long and drains a basin of 13,650 sq. mi. It can be said to begin from its main tributary, the Yegorlyk, since its apparent source, Lake (Ozero) Manych-Gudilo, rarely has any outflow. The river flows northwestward through the Manych depression (Kumo-Manychskaya Vpadina) by which the Caspian was once linked to the Black and Azov seas) to join the Don,

93 km. (58 mi.) above its mouth. It lies in an area of low rainfall and its water supply is almost entirely from snowmelt. This causes a spring flood and very low water at other seasons. However, since the construction of a barrage and reservoir at Vesely and of the Nevinnomysski canal (1949), which takes water from the Kuban into the Yegorlyk, navigation has been possible as far as Proletarskaya. East of Lake Many-Gudilo is the Eastern (Vostochny) Manych river, receiving water via the Kalas river from the Stavropol uplands and flowing eastward through the depression toward the Caspian. The Eastern Manych soon dries out in reed beds and salt lakes. Proposals have been made to convert the Manych rivers into a waterway which would link the Azov and Caspian seas and irrigate the Manych depression.

(R. A. F.)

MANYEMA, a name given to the members of various scattered communities of Swahili-speaking Muslims of the eastern Congo and Tanganyika (see SWAHILI LANGUAGE). They consist of the descendants of slaves taken by the Arabs during the period of Arab slaving in this region, and also of half-caste Arab-Africans. The trade was based on Zanzibar and there are many Manyema in Zanzibar, the term also being applied to people coming as immigrants from the Congo-Tanganyika region. They are included in the term Arabisés, used for Swahili-speaking Muslims in the Congo. They do not form a single political entity, but a loose scattered community of people linked by their religion, their language and their occupation; most of them are traders and artisans in urban and semiurban centres.

MANZIKERT, BATTLE OF. In the spring of 1071 the Byzantine emperor Romanus IV Diogenes, having collected an army of about 60,000 men, marched into Armenia to recover the fortresses of Akhlat and Manzikert, captured by Alp Arslan and his Seljuk Turks. At Akhlat he divided his army and with the main body marched to Manzikert and reduced it. Hardly had he done so when he fell in with Alp Arslan's advanced guard. The sultan's army was 100,000 strong and mainly consisted of horse archers. Romanus was a brave soldier, but impetuous. In the advanced guard encounter one of his generals, Basilakes, fell into an ambush, losing all his men. The emperor then drew up his army in front of his camp. In rear he drew up a strong second line of Germans and Normans under Andronicus Ducas. As Romanus advanced on his enemy, the Turks refused to close, hovering round the two lines and plying them with arrows. According to the Greek narratives the emperor, fearing that his camp was in danger, ordered a retirement. This order was misinterpreted, and confusion resulted, whereupon the Turks, closing in, compelled the emperor to face about. Andronicus refused to halt and retired to the camp, leaving the front line open to attack from the rear. According to the Oriental sources, the Greek troops fell into an ambush prepared by the Turks. In either event Romanus was defeated and made a prisoner. The result was disastrous: Asia Minor was overrun, and by 1080 the old Byzantine army had all but ceased to exist.

(J. F. C. F.; X.)

MANZONI, ALESSANDRO (1785-1873), Italian poet, and also the author of *I promessi sposi* (*The Betrothed*), a historical novel that has been ranked with the chief masterpieces of European literature, was born at Milan on March 7, 1785. His mother was the daughter of Cesare Beccaria, the penal reformer. He was brought up as a Catholic, but, after joining his mother in Paris (1805), he mixed with the literary circle of the so-called "idéologues," and became a convert to Voltairian skepticism. In 1808, however, he married Henriette Blondel, a Calvinist from Geneva who in 1810 became a fervent Catholic; and he then reverted to his former faith. Settling in his villa at Brusuglio, Lombardy, he led for many years a retired life, devoted partly to literary and linguistic studies, and partly to farming. His wife died in 1833, and in 1837 he married again. His writing won him the esteem of Goethe, his religious thought made him a friend of Rosmini and he came eventually to be recognized as one of the leading spirits of his age. In 1860 he was made a senator of Italy. The Christian serenity of his life was unaffected by his fame and unshaken by many blows (not only both his wives but also eight of their ten children predeceased him). He died

in Milan on May 22, 1873. Verdi's *Requiem* (1874) was written to honour his memory.

Manzoni's early poems, "Il trionfo della libertà," "Adda," the series of "Sermoni" (written 1801, 1803, 1803-04; all published posthumously) and *Urania* (publ. 1809), show the influence of Vincenzo Monti and Giuseppe Parini; it is in his elegy on the death of his mother's lifelong friend, *In morte di Carlo Imbonati* (1806), that his individual talent is first revealed. Then followed a series of sacred lyrics, *Inni sacri: La risurrezione, Il nome di Maria, Il natale, la passione* (written 1812-15; publ. 1815), and, the best of them all, his masterpiece *La pentecoste* (written 1817-22; publ. 1822); the treatise *Osservazioni sulla morale cattolica* (1819); and *Il conte di Carmagnola* (1820), a tragedy which, by its bold violation of classical convention and its passionate political inspiration, showed clearly the influence of the romantic movement. The Piedmontese revolution of 1821 inspired the beautiful ode "Marzo 1821" (publ. 1848, in *Pochi versi inediti*), and on the death of Napoleon in the same year Manzoni wrote another ode, *Il cinque maggio* (publ. 1823), declared by Goethe to be the greatest of many written to commemorate that event. His second tragedy, *Adelchi* (1822), dealing with Charlemagne's overthrow of the Lombard kingdom and conquest of Italy, although it lacks dramatic power, is nevertheless rich in passages of deeply moving poetry, especially in the choruses depicting the arrival of the Franks and the death of Ermengarda.

Manzoni's greatest work, however, is his novel *I promessi sposi*. After its first publication (3 vol., 1827, with imprint 1825-26) Manzoni patiently revised it, carefully removing anything that was not pure Tuscan idiom from the language, and finally republished it in 1842 (with imprint 1840). It is the story of two peasant lovers, Renzo and Lucia, in 17th-century Lombardy under Spanish rule: a wicked local tyrant, Don Rodrigo, forbids their marriage, and the parish priest, Don Abbondio, bows to his will; but a courageous friar, Cristoforo, takes up the lovers' cause and helps them through many adventures to safety and marriage. The description of such great historical events as the Milanese insurrection, the Thirty Years' War and an outbreak of the plague is cleverly woven into the narrative. But *I promessi sposi* is much more than a historical novel: it is one of the great literary works of modern times, comparable for richness of beauty and depth of meaning with Goethe's *Faust* and Cervantes' *Don Quixote*.

Manzoni's seriousness of purpose, Christian resignation to the evils of life, confident hope in the triumph of a righteous cause and concept of religion as the ultimate comfort of mankind give the novel its moral import, while his poetical inspiration, the charm of his style and a pleasant vein of humour contribute to its excellence as a work of art and to the reader's enjoyment.

For a portrait of Manzoni see ITALIAN LITERATURE.

(F. Di.)

MAORI. This Polynesian people, composing about 7% of the population of New Zealand, came of a seafaring stock. Members of the great Polynesian linguistic and ethnic group which inhabits the far-scattered island groups of the eastern Pacific, they are the result of an intermixture of several distinct waves of canoe voyagers, the last of which, in the mid-14th century, came from Tahiti, with Rarotonga—about 1,800 mi. N.E. of New Zealand—as the port of call. Evidence of this is provided by comparison of the traditions and genealogies scrupulously preserved by the learned men in each tribe. The most important cultural influence in the Maori population was provided by the "great fleet" that arrived in 1350, and on this the traditional social organization largely depended. Prior to that time the islands were inhabited by the *tangata whenua*, "the people of the land," some of whom were descended from Toi-kai-rakau, a Polynesian immigrant of about

1150, and others probably from drift voyagers. With these folk the later arrivals intermarried and fought, ultimately gaining the ascendancy. The visit of Toi was in the nature of a search party for his lost grandson. The later migration, however, was a premeditated colonization; the *kumara* ("sweet potato"), taro, yam and other cultivated plants were introduced, as was the native dog.

Social Grouping.—The Maori people are divided into a score or more tribes, *iwi*, each with its own well-defined lands, and tracing kinship to a common ancestor. Thus all members of Ngati Maru, a tribe around Hauraki, claim descent from Marutuahu, the famous 14th-century chief whose name they bear. The principal canoes associated with the fleet are Tainui, Arawa, Matatua, Takitimu, Tokomaru and Aotea, and, generally speaking, the particular group of tribes descended from the captain and crew of each vessel occupies contiguous territory and forms a separate unit of a loose political nature, known as a *waka*. Thus Ngati Maru, together with Waikato and the tribes of the King country make up the Tainui *waka*, a human canoe which extends from Hauraki to Mokau. A tribe is made up of several principal hapu or clans, each of which might in olden days include about 1,000 fighting men. The hapu was not a unilateral group, *i.e.*, a person could belong to it through either his father or his mother, nor was it exogamous, marriage within the group being favoured provided that the parties were not first cousins.

Within these major social units were lesser hapu, tracing descent to more immediate ancestors, and these in turn were composed of *whanau*, family groups of near relatives who together often occupied a dwelling hut. The individual family of parents and children existed, but, not forming a separate household, did not play a large part in public life.

The system of primogeniture played a leading part in the social organization. The highest chief was the *ariki*, eldest son in a line of first-born men of rank. His *mana* was very great; his word was law. The people of his tribe were his relatives, their rank being broadly represented by the closeness of their kinship to him. Next to him came the chiefs of his own family, then the *rangatira*, and finally the commonalty (*ware*). But every ordinary man, however undistinguished, could claim some sort of distant connection with his chief and with a noble family. Slaves (*taurekareka*) were mainly recruited from prisoners of war, and performed much of the menial labour.

Traditional Economy.—The Maori lived in villages (*kainga*), usually with a fort or defended position (*pa*) close at hand. In the north, fertile soil and a warm climate allowed the cultivation of the *kumara* but in less-favoured districts forest products and the edible rhizome of the *aruhe* fern (*Pteris esculenta*) formed the staple food supply. Birds and the frugivorous native rat were snared and preserved by inland tribes; eels were taken by weirs on the Whanganui river, while around Rotorua and adjacent lakes crayfish and the fresh-water mussel were obtained. Fish was the main food of the dwellers on the seacoast.

Advantage was taken of the communal mode of life to secure co-operation in various tasks, and such labour was lightened by work songs. Division of labour was practised, though in somewhat rudimentary form. The men did harder work such as tree climbing, carving, fishing and fowling and tilling the ground for crops. The women weeded the crops, collected shellfish, plaited mats and wove garments from the useful harakeke and attended to the cooking of the two daily meals. In each industry were specialists (*tohunga*) who had received training, including knowledge of the magic of the craft.

Warfare was frequent and each man was trained in the use of weapons. Hand-to-hand fighting was preferred, and ambushade and stratagem were frequent. In later warfare against Europeans the Maori proved extraordinarily proficient in the military art. In time of peace the social side of life was developed, visits were made, and neighbouring tribes were invited to feasts at which dart throwing, wrestling, top spinning and posture dancing held the interest of the people. Such receptions were held on the *marae*, the temple enclosure in the centre of the village. Feasts also took place at *tangi*, the ceremonial wailing for the dead, at which many relatives assembled from long distances.

Religion.—The traditional religion of the Maori was closely bound up with social and economic life. The common people recognized a number of gods, as Tane-mahuta, guardian deity of the forest, trees and birds, or Tangaroa, the Polynesian Neptune, lord of the sea and fish. The higher priests and chiefs also held belief in Io, a supreme god of rather negative attributes, to whom appeals were made in birth, baptism and marriage ceremonies for people of rank. This knowledge was jealously kept from the common people and from foreign anthropologists for many years. All Maori believed in a host of minor *atua*, rather malignant beings who provided omens, gave force to black magic, and punished breaches of tapu. The tapu was one of the strongest forces of law in the Maori community. With a sacred or unclean significance, according to circumstances, it conveyed essentially the idea of a prohibition. For instance, the person of a chief, his goods, his place by the fire and the remnants of his meal; all things connected with the gods; a corpse and the surroundings of death were all tapu, as were also a cultivated field or a new house or canoe. Thus things of social importance were protected from improper interference.

According to Maori belief, man was endowed with several spiritual *potentiae*, the *wairua*, the spirit which wanders abroad in dreams, the *mauri* and the *hau*, allied metaphysical concepts representing the vitality of a person, his essential life principle. At death the latter are dissolved, but the *wairua*, the soul, wends its way to Te Reinga, or Te Po, the underworld beneath the sea, a peaceful abode where men pursue their ordinary avocations as in life. See also references under "Maori" in the Index.

MAO TSE-TUNG (1893–), Chinese revolutionist and statesman, Communist Party leader and founder of the Chinese Communist state, was born into a moderately prosperous peasant family in the central Chinese province of Hunan, on Dec. 26, 1893. He early betrayed a restless, rebellious temper and left the paternal farm; for ten years he attended school after school, and clutched at creed after creed, at a time when China was lapsing into chaos. An avid reader, he felt briefly attracted to constitutional monarchism and English idealism, utopian socialism and anarchism. He finished normal school in 1918 and went to Peking, where he took a humble post in the library of Peking University. There he met two professors whose social criticism drew him into their orbit; these were Li Ta-chao and Ch'en Tu-hsiu, eventually the principal founders of the Chinese Communist Party.

Mao returned to Hunan in 1919 and briefly taught school before Marxism finally became his faith and revolution his career (1920). He helped to found the Chinese Communist Party (1921), and as its leader in Hunan devoted his principal energies to launching a trade-union movement. His local successes earned him a place in the party's national leadership (1923); he went to Shanghai, then to Canton, to serve in its two biggest headquarters (1923-26). But his old restlessness reappeared in the headquarters atmosphere; he often changed posts and seized any pretext to return to Hunan. One such return, in 1925, became a historic turning point: Mao discovered the latent strength of the peasants and organized them for action. Other party leaders had done so before him and might have risen as high from their own rural bases if they had not met early deaths in subsequent wars with the Kuomintang (Nationalist Party). (See CHIANG KAI-SHEK; KUOMINTANG.)

Until 1927 the Kuomintang remained an ally of the Communists, and Mao received various posts in it, even that of chief propagandist (1925-26); but rather than wait for the certain split he returned once again to Hunan (summer 1926). While the alliance

MAO TSE-TUNG

tell slowly apart, he staged his first peasant rebellions, each quickly suppressed by Kuomintang troops, until he had to flee to the mountains (1927). After three years of roaming and regrouping his forces, he succeeded in establishing Red enclaves in the south-eastern hinterland and proclaimed a "soviet republic" (1931). He became chairman but shared actual power with a Soviet-trained group of leaders, who considered his knowledge of Marxism weak and his policies opportunistic. They thought that he showed an in-born peasant mentality, seeming content that backward peasants should fill a Communist Party. They also grew more and more distrustful of his guerrilla tactics and finally made the Red command switch to positional warfare. But the defenses that they ordered built broke under the next assault by superior Kuomintang numbers; and the defenders found themselves forced to abandon the "soviet republic" (1934). Mao, vindicated as a strategist, led his remaining forces across China to the northwest, where they settled on new bases (1935-36). During this trek, the so-called Long March, he gained full control of the party; henceforth he determined its policies and proclaimed them dogma.

War with Japan forced Mao and the Kuomintang into an uneasy armistice; it also made Mao adopt moderate policies that won him much liberal sympathy. But civil war quickly resumed after Japan surrendered; the Communists won, sooner than they had hoped, by superior morale and leadership. Once they controlled continental China they proclaimed a people's republic (1949); Mao became chairman (i.e., chief of state), a post that he kept through the following decade. He visited Moscow (his first trip abroad) to conclude an alliance with the Soviet Union and to secure all possible aid for China's economic development (winter 1949-50).

After Stalin's death (1953), Mao's influence grew throughout the Communist orbit, and he became freer to assert claims to ideological leadership. These rested on his contributions to Marxist-Leninist doctrine: actually new adaptations of it, not additions of substance. As China's ruler, Mao soon abandoned his moderate wartime policies for radical programs to transform the country ever more quickly and thoroughly. He drove the bulk of the Chinese people into a collective existence and into a race to catch up with the West in industrial production. With a fixed vision and determination to translate it into reality, he built in ten years the most tightly controlled and most taut-nerved of modern societies.

In 1959 Mao resigned as government chairman though not as party chairman, and henceforth exercised his leadership increasingly from the background. His restiveness under Soviet tutelage led to sharpening rivalry between him and Moscow for the leadership of world communism and finally to an open rift between the two countries in the early 1960s.

In 1966 Mao, at the age of 73, staged a determined attempt to resume active and personal leadership of the entire Chinese Communist movement and to imbue it with pristine militancy by pitting youthful "Red Guards" as well as army units against the

party hierarchy which had helped him to seize and wield power but which, in his view, had lost its revolutionary ardour.

MAP (MAPES), **WALTER** (c. 1140-c. 1209), medieval ecclesiastic, satirist, and wit, author of the *De nugis curialium* ("Of Courtiers' Trifles"), came from the Anglo-Norman marcher aristocracy of Herefordshire. He studied in Paris between c. 1154 and c. 1162. On his return to England he became a clerk in the household of Henry II and an itinerant justice. He attended the third Lateran Council at Rome (1179) as Henry's representative and while there disputed with some members of the sect of the Waldenses. His connection with the court seems to have ended with Henry's death (1189). Successively a canon of St. Paul's, Lincoln, and Hereford, he became archdeacon of Oxford (1197). He was considered for the bishopric of Hereford in 1199 but failed to be appointed. He died between March 1208 and March 1210.

De nugis curialium, a miscellaneous collection of essays, homilies, and anecdotes, of which one late 14th-century manuscript survives in the Bodleian Library, was probably written between 1181 and 1193. Full of biblical, scholastic, and classical allusions, it bears potent witness to Walter's erudition and excessive preoccupation with literary precedent. It provides a racy and often ribald picture of contemporary opinions and manners, reflecting its author's immense prejudice against monks, especially against the Cistercians and St. Bernard. It gives interesting accounts of the military orders, the Templars and Hospitallers, and adds to our knowledge of Henry II's eldest son, the "Young King" (d. 1183). Walter Map has also, doubtfully, been credited with the authorship of the original Latin versions of the Arthurian legends, the *Lancelot*, the *Queste del Saint Graal*, and the *Mort Artu*, and of much surviving Latin Goliardic verse.

BIBLIOGRAPHY.—The Latin text of *De nugis curialium* has been ed. by M. R. James (1914). For English versions see M. R. James (ed.), *Walter Map's "De Nugis Curialium"* (1923); F. Tupper and M. B. Ogle (ed.), *Master Walter Map's De nugis curialium (Of Courtiers' Trifles)* (1924).

MAP, a systematic representation on a surface of the nature and distribution of phenomena in space. For example, terrestrial and celestial globes are maps of the earth and of the heavens, respectively, on a spherical surface. In a more restricted sense, a map depicts on a flat surface (plane) the relationships between selected items on or about the nearly spherical surface of the earth. Most maps are of this kind.

A map projection is a system whereby horizontal positional relationships on the earth's curved surface are shown on a plane. There are innumerable projections, though only a few are in common use. Vertical relationships, essentially elevations above sea level, can be indicated on a flat map both quantitatively and qualitatively by various methods, which come under the general heading of relief representation.

Cartography is the art and science of map making. The development of the map is a part of the story of discovery, exploration and accumulation of detailed geographical knowledge; thus, in this article the history of cartography will be dealt with in its broadest sense.

The article is outlined as follows:

I. ELEMENTS OF MAPS

A. MAPS IN THE MODERN WORLD

1. Uses of Maps.—Maps provide an efficient and unique means for communicating certain types of information. Though a listing of all the countries in the world and their areas may be prepared, only a map can show the arrangements of these countries with respect to one another and the configuration of their boundaries. A map, unlike a photograph, does not reveal all the detail that can be seen in a landscape, but it provides a more comprehensive and selective picture. By a suitable choice of projection it is possible to prepare a map on which an observer can see at a glance a representation of the whole surface of the earth. This is not possible in the case of a terrestrial globe.

Maps are useful in many activities: in the appraisal, conservation and development of natural resources; in analyzing and forecasting weather conditions; in agriculture, fisheries and general commerce; in regional planning; in the building and development of communications; in the location of industry; and in property surveys and the demarcation of boundaries. Governments need maps for aid in settling boundary disputes and controlling floods and droughts, taking censuses, levying taxes, organizing franchises, law enforcement and the promotion of justice and health. Without maps the regulation of transportation and traffic control, on land and sea or in the air, cannot be undertaken efficiently. Maps aid in navigation by sea and air (see *CHART*). Planning and execution of military operations, defensive and offensive, tactical and strategic, would be impossible without maps. In fact, considerable mapping in the past was done for military purposes, and mapping activities were greatly stimulated and advanced during World Wars I and II.

One of the most significant uses of maps is that made by scientists concerned with the causes and effects of the distributions of phenomena, in such disciplines as geology, oceanography, meteorology, climatology, animal and plant ecology, agronomy, economics and the social sciences, as well as geography itself. In all these fields maps are indispensable tools. They record observations in succinct form; they aid in analysis; they stimulate ideas and aid in the formulation of working hypotheses; they make it possible to communicate findings.

Maps promote accessibility and freedom of movement by showing where places are and how they may be reached. They aid people to understand their own and others' environments, and they

frequently accompany articles on important world events in newspapers and other periodicals. On occasion maps have been designed for propaganda—to promote local or national interests or to mislead for political purposes—in much the same way as statistics are sometimes abused. Fortunately such maps are rare; nevertheless all are not necessarily equally reliable in their content, and in the past cartographic sins of omission and commission frequently have been masked, wittingly or unwittingly, by excellent draftsmanship and reproduction. Thus an intelligent use of maps requires an appreciation of the factors that contribute to making maps reliable and an awareness of both the advantages and limitations of maps as mediums for the communication of factual information.

2. Concepts of Scale.—Scale means the size of the representation of an object in respect to its actual size. If a ship model's scale were to be given as 1 in. to 12 ft., few would fail to understand what is implied. On maps, more generally convenient methods of expressing scales are by means of the representative fraction or proportion as, for example, $\frac{1}{144}$ or 1:144, because these are independent of the unit of measurement employed. Thus $\frac{1}{144}$ is equivalent in meaning to 1 in. to 144 in. or 1 ft. to 144 ft. or 1 m. to 144 m. The scale of a map is smaller than the scale of another map if its scale denominator is larger: $\frac{1}{10,000}$ is a smaller scale than $\frac{1}{1,000}$.

On maps it is necessary to distinguish between linear and areal scale. In the fractional notation the areal scale denominator is equal to the square of the linear scale denominator (see fig. 1). Areal scale can be made constant by using a particular type of map projection (see *Map Projections*, below). On the other hand, it is impossible to maintain a precisely constant linear scale. Expressed in another way, the measured distance between two points will bear a definite scale relationship to the true curved distance on the earth, but this relationship will vary from one pair of points to another. When two points are extremely close a finite linear scale relationship still exists. A useful mathematical abstraction, therefore, is the concept of the scale at a point; i.e., scale when the distance mapped is infinitely small. Such a concept gives meaning to such statements as "the scale is constant along a line on a map," or "the scale varies on a map as a function of distance and direction from a point."

FIG. 1.—THE LINEAR SCALE OF SQUARE B IS $\frac{1}{2}$ OR 1:2 IN RESPECT TO SQUARE A: ITS AREAL SCALE IS $\frac{1}{4}$ OR 1:4

FIG. 2.—CHORD AND SURFACE ROUTES BETWEEN PAIRS OF POINTS ON A SPHERE

Because linear scale may vary from point to point, it is convenient to refer to the "nominal scale" of a map. This may mean the scale at a central point, or the constant scale along a particular line or set of lines on the map. It also may refer to the scale of a hypothetical globe from which the flat map has been projected. The term map scale without a qualifying statement usually refers to the nominal linear scale.

Scale ratio is a convenient term for the scale at a point divided by the nominal scale. For example, if the nominal scale is $\frac{1}{100,000}$ and the scale at the point is $\frac{1}{200,000}$, the scale ratio is 0.5, and if the scale at the point is $\frac{1}{50,000}$ the scale ratio is 2. The scale ratio at every point would be approximately equal to 1 only on a globe.

The difference between the chord distance and the surface distance between two points on the earth increases, of course, rapidly with distance. For example, the differences for 100 mi. and 1,000 mi. are 1 part in 39,458, and 378 respectively. These figures suggest that short distances can be scaled from a map with a fair degree of accuracy, even though in the mapping process the earth were to be considered flat. Consequently on large-scale maps of small areas it is customary to give a graphical scale as in fig. 3; on a very small-scale map, showing the whole world or large parts of it, a graphical scale of this sort may be misleading.

3. Classification of Maps.—Maps may be classified according to the method of their construction or according to their content and scale. In classifications of the first kind the major divisions

FIG. 3.—GRAPHICAL LINEAR SCALES

are usually between (1) surveyed maps made directly from precisely controlled surveys on the ground or from the air, and (2) maps compiled from a selection of the information contained in the surveyed maps. Surveyed maps are rarely on scales smaller than $\frac{1}{125,000}$ (roughly 1 in. to 4 mi.), usually on considerably larger scales and frequently on much larger scales. For example, the whole of Great Britain and Ireland with the exception of waste or mountainous areas has been mapped on the scale of $\frac{1}{250,000}$ or about 25 in. to 1 mi.

Though there is no hard and fast division between the scales of surveyed and compiled maps, the latter are usually on smaller scales and may be on very small scales indeed. A map of the world appearing in a book may show the equator as a straight line six inches in length; since the equatorial circumference of the earth is approximately 24,900 mi., the scale on the equator would be 1 in. to 4,150 mi., or approximately $\frac{1}{830,000,000}$.

Surveyed maps which show physical features such as rivers, lakes, forested areas and swamps, together with man-made features such as roads and towns, but with no representation of relief, are called planimetric (United States usage). When relief representation is added they are called topographic. Cadastral maps show property and political boundaries, roads and the shapes of buildings, etc., in sufficient detail so that dimensions may be recovered from them within the limits of accuracy controlled by the scale. Compiled maps may also be planimetric or topographical, but these terms usually are limited to map scales greater than $\frac{1}{1,000,000}$. On smaller scales, a general-purpose map is perhaps a preferable term.

An outline map, usually on a small scale and covering a large region, shows in simplified form coast lines, principal rivers and lakes and sometimes political divisions. Base maps may be simple outline maps or somewhat more complicated; their purpose is to present a base upon which specialized data can be plotted.

4. Modern Map Makers and the Status of Mapping.—Most of the topographical and cadastral mapping in the world is undertaken by national governments, though in the second half of the 20th century private corporations such as oil companies were still undertaking large mapping operations in underdeveloped regions.

Governments also produce maps compiled from their original source maps on smaller scales and from statistical and other data either as general-reference maps or for special purposes. The most important results of international co-operation in the production of compiled maps are the International Map of the World and the World Aeronautical Charts, the latter subsequently discontinued and replaced with a series called the Operational Navigation Chart; all are on the scale of $\frac{1}{1,000,000}$. The International Map of the World consists of series of topographical or general-purpose maps prepared by the various participating countries according to internationally accepted standards. The other series contain for the most part less general information but a wealth of detail needed for air navigation.

Various geographical societies compile and publish maps showing the results of exploration and geographical discovery. Some of these societies—notably the National Geographic society (Washington, D.C.), the British Royal Geographical society (London) and the American Geographical society (New York)—undertake large cartographical projects. The National Geographic society produces many general reference maps for popular use, and the Royal Geographical society and the American Geographical society, among their numerous cartographical activities, have done much to promote the International Map of the World. For example, the American Geographical society, over a period of 25 years ending in 1947, compiled from thousands of original sources a series of 107 sheets covering the whole of Latin America on the scale of $\frac{1}{1,000,000}$ and conforming in essentials to the international scheme.

While most of the maps produced by commercial map publishers are based on surveys and compilations made by governments and private nonprofit organizations, this is by no means always the case. For example, the widely used road maps require special compilation and considerable research and revision to keep them up-to-date.

Maps appearing as illustrations in newspapers, other periodicals and books are often prepared by free-lance cartographers. These maps must often be prepared in a hurry, and to make them effective, special skills and artistry are required.

Not all national governments are willing to reveal the extent to which their countries have been mapped; hence it is not possible to give exact figures as to the status of mapping throughout the world. By the 1960s, however, probably less than 25% of the world's land surface had been mapped adequately on topographical scales and far less than that on cadastral scales. Because of man's activities in changing the face of the earth, mapping is a continuous process, and map revision is almost as serious a problem as the initial surveying. A map satisfactory at one time may become quite unreliable within a very few years. The general use of aerial photography from World War I and especially from about 1930 has helped solve this problem; the mapping process has been greatly accelerated and mapping revision has become easier. Nevertheless, it cannot be positively stated that mapping as such has kept pace with the mapping needs of a rapidly expanding world population.

B. TECHNIQUES OF MAP MAKING

1. Compilation.—There are two principal steps in map compilation: (1) appraisal and selection of original source maps; and (2) selection of features to be shown and of the manner of their depiction, so that the compiled map, usually on a smaller scale than the original source material, will contain only essential information and will be legible and uncluttered. The first step poses no problem when the source material consists of accurately controlled survey maps, but difficulties occur when the area is poorly mapped or is mapped unevenly in patches by small local surveys or by reconnaissance surveys, the latter consisting largely of explorers' traverses and descriptions. For example, on a single sheet of the International Map of the World, hundreds of different sources, all varying in quality, may have been used. In such cases a small index map may be included in the margin to show the relative reliability of the source material. This procedure, now standard for sheets of the International Map, was first employed on the American Geographical society's maps of Latin America.

2. Drafting and Reproduction.—A completed map compilation is comparable with an author's typewritten manuscript. Before a finished map can be published, it must be redrawn in finished style and printing plates must be made. A draftsman must be able to draw smooth straight lines and curved lines varying both in their curvature and their width. He must be adept in the positioning of place names, so that important details are not masked. Up until about 1930, lettering was done mostly by hand; now, though there are still expert hand letterers, and hand lettering allows flexibility in size and spacing, large map-making establishments for the most part employ "stick up" lettering, in which names are printed, cut out, placed in position on the map drawing and stuck or burnished on. It is still an open question whether this process materially speeds up lettering; its main advantage is that it can be accomplished by relatively unskilled workmen. A similar procedure is frequently followed in laying down background patterns of fine lines or dots to differentiate among different types of areas. Patterns of many different kinds are printed for this purpose. When a map is to be printed in only one colour, the printing process may follow any one of a number of methods. Coloured maps are generally printed by photolithography rather than by letterpress, on rotary offset presses.

When colour is to be used, the finished map drawing is rarely hand coloured and reproduced by the kind of colour processing used in the reproduction of paintings. Instead, line copies of the compilation generally are made in nonphotographic blue. On these copies the draftsman makes separate finished drawings in black for each solid printing colour to be used, using the blue lines as guides. When background tints are required, a colour guide is provided for the printer, who can produce in addition to the solid colours a wide variety of tints by means of half-tone screens, etc., used in conjunction with platemaking photography. In some cases, as many as a dozen printing plates have been used to produce a required colour effect on a single map sheet.

The chief technical problem to be surmounted by colour separation in the drafting stage is to insure that on the composite reproduction of the separate drawings there will be no interference between the different-coloured symbols and place names and that there is precise register, or fit, among the different colours. To accomplish this, it is necessary before the printing plates are made to proofread and edit the composite. This can be done by superimposing the various drawings over a "light table," which has a translucent surface illuminated from below. This, however, is an exacting and time-consuming procedure, and after World War II, several proofing processes were developed to facilitate the final checks. Contact prints of each colour separation drawing are made onto a single base by using a new emulsion for each successive exposure; separate drawings thus can be reproduced in different colours on the same sheet, and necessary adjustments will be indicated before the printing plates are made.

This proofing process does not by itself solve the technical problem of obtaining good register. For this, the separate finished drawings must be made on material that will not expand or contract significantly because of use or of changes in temperature and humidity. Printing plates must be made with great precision, and temperature and humidity control are essential during the actual printing.

Before World War I, first-class coloured maps were published for the most part in small editions. After that time, and especially after World War II, technological developments made possible the economical production of highly precise maps in editions that may run into millions of copies. Register was brought under better control, for instance, by the development of synthetic plastic materials, which keep their shape better than paper does, on which to make the colour separation drawings. Again, most map printing is done on multiple-colour presses, reducing the danger of paper distortion that might occur when there is considerable time lapse between the printing of one colour and the next on single-colour presses.

After plastics were introduced, the trend in most of the big mapping organizations was to eliminate as far as possible pen and ink drafting. In addition to "stick-up" lettering, "scribing" is widely used. In this work, a transparent glass plate or plastic sheet is coated with a thin opaque film. A light-sensitive emulsion is then spread over the surface, an exposure of a negative of the original compilation is made onto it and a line image developed. The finished line drawing is prepared by means of a scribing tool that scrapes or cuts the opaque coating away as desired, leaving a sharp transparent line against the opaque background. The main advantage of scribing over pen and ink work lies in the fact that fine sharp lines can be produced by persons with comparatively little training.

3. Detailed Design.—The minimum width of line that can be reproduced by offset lithography is about 0.002 in. A single black line of this width against a white background can be perceived by the normal human eye at the usual reading distance of between 10 and 20 in. As the viewing distance is increased, the eye soon fails to resolve the line, and if the distance is decreased there is difficulty in focusing. If a series of parallel straight lines 0.002 in. in width spaced 0.004 in. from centre to centre is viewed at normal reading distance, the average eye will see this pattern only as a smooth tint against the background.

These limits of printing and visual acuity have great significance in the rendering of detail and in the over-all design of a map. On

scales of $\frac{1}{100,000}$ and $\frac{1}{100,000}$, respectively, 0.002 in. represents 16 ft. 8 in. and 166 ft. 8 in., and it is evident that many line features on the ground, such as roads and minor streams, cannot be shown distinctly except on the largest scales without an exaggeration of their widths. This, however, immediately suggests that variations in the width of printed lines on a map can be used to distinguish between line features of greater and lesser importance. Two effects occur when the width of a line feature is exaggerated: details in the neighbourhood of the line are masked, and the true shape of the line is smoothed out or generalized.

As the scale of a map becomes smaller, more and more detail must be eliminated and there must be greater generalization of what is left. In many cases, the outlines of important features (for example, towns or airport runways) must be eliminated and purely artificial symbols substituted.

Thus, except on very large scales, the representation of pertinent information on maps is not a true simulation to scale of features of the landscape but rather a symbolization or codification of information which requires learning. A well-established convention is to orient maps so that in general the north direction is toward the top of the map sheet. Convention is also important in the use of colour to differentiate between different types of lines or different types of areas. There is often an association of ideas, such as blue for water and green for forested areas, but colour is used principally for distinctiveness rather than to portray the landscape.

Names, essential items on most maps, also are symbols, whose selection and positioning constitute a specially difficult problem in composition. They tend to mask essential details of the landscape and otherwise to cause clutter. Without the exercise of thought and skill, they either may be hard to read or else may dominate the map at the expense of all other features. If properly composed, they not only name and locate places but may also, by means of different styles of type, aid in differentiating among different classes of features; e.g., size of lettering may give a general indication of the size of a town or city.

The foregoing considerations indicate that the functional elegance of a reliable map is dependent largely on a critical selection of detail and place names, and on the portrayal of these legibly, with the proper emphasis and with the right degree of generalization or symbolization. This is the cartographer's art.

Because the interpretation of symbols, or as they are sometimes called conventional signs, is not immediately obvious, it is customary to provide an explanation in the margins of a map. This, together with details such as the title of the map and its nominal scale, combine to form what is called the map legend. When a number of sheets cover a region on a uniform nominal scale and with the same system of symbolization, a separate conventional sign sheet is often printed.

4. Relief Representation.—Relief, the variation of the earth's

continuous surface in slope and in elevation either above or below sea level, influences many of man's activities—transportation, agriculture, housing, flood control and military tactics, to name but a few. It is therefore important that relief be shown clearly. This, however, involves representing a third dimension on a two-dimensional surface, a representation that can be achieved only symbolically.

In fig. 4, two primitive methods are shown. The number and dot show the elevation and position of a single spot, usually a hilltop or mountain whose general shape and location are indicated by the "caterpillar" type outline. On a map covered with a composite of such crude symbols, the character of the relief cannot be properly interpreted; there is no quantitative representation of slope. On most maps that show relief, such selected spot elevations do appear: usually they are supplemented with contouring, layer or hypsometric tinting, hill shading, hachuring or other symbolic representations, singly or in combination.

FIG. 4.—SPOT ELEVATION AND ROUGH OUTLINE OF HILL. PRIMITIVE METHODS OF SHOWING RELIEF (see TEXT)

Contouring.—Contouring, which depicts relief both quantitatively and qualitatively, is by far the most important method. A contour line (*q.v.*) on a map is the representation of an imaginary line on the earth's surface having a constant elevation above sea level. The nearest approach to a contour line in reality is the outline of a lake. The pattern produced by contour lines at uniform vertical intervals makes it possible to determine the elevations of points by interpolation. Slopes can be estimated from the horizontal spacing between adjacent contours, since the closer the contour lines the steeper the slope represented, and it is this feature of the contour method, together with the general arrangement of

FIG. 5.—LANDSCAPE SHOWN IN PERSPECTIVE (A) IS REPRESENTED WITH THE AID OF CONTOUR LINES ON MAP (B)

the contour lines, which gives expression to the relief character of the ground. The method has its limitations, however.

A uniform vertical contour interval on a particular scale may be adequate for representing major land forms but may fail to catch small but significant details. If the vertical contour interval is small enough to catch such details, the contour lines may have a tendency to merge on steep slopes; this occurs because it is necessary to show contours, theoretically of no width, as printed lines of finite width. For example, on the scale of $\frac{1}{62,500}$ (one inch to the mile) if the width of the printed contour lines is 0.004 in. 20-ft. contours will be hard to see separately (if at all) on slopes greater than about 26° , yet in otherwise flat country they will not portray steep rises of less than 20 ft., though these may be important features in the landscape.

In areas of moderate but complex relief, the visual picture given by contour lines is often hard to interpret. This difficulty can be partly obviated by emphasizing certain contour intervals as, for example, every 100-ft. contour when the regular contour interval is 20 ft. Finally, from a graphical standpoint, contours must be printed boldly. If they are subdued or overprinted by a multitude of names or other features, they lose their visual effectiveness.

Hypsometric Tinting.—With layer or hypsometric tinting, successive zones of elevation are coloured differently. This aids in the visualization of relative elevations and can be quickly understood even by schoolchildren. If the area mapped is of moderate relief, only a few tints may be sufficient and these may be in one hue, usually darkening as higher land is covered. More often, in order to obtain sufficient distinction between a large number of zones, variation in hue is introduced. Established convention generally demands that the hues follow the spectrum, starting with green for low land and proceeding through the buffs and oranges to dark red or brown or even purple for higher elevations. Even so, how-

ever, not enough colour differentiations are available to make the method altogether effective. For example, for the sheets of the International Map on the scale of $\frac{1}{1,000,000}$, it is specified that the elevation range of the colour zones increase with elevation and that above 3,000 m. (9,842 ft.) all land be shown in the same tint; thus, relief detail diminishes as elevation increases, and hills and valleys in high upland regions may have no representation at all.

Hill Shading.—Hill shading, a qualitative method of presenting relief features, gives a three-dimensional or plastic effect somewhat similar to that provided by an actual model of a landscape. It is based on the optical theory that the brightness of any small area on a perfectly diffusing undulating surface varies as the cosine of the angle of incidence of parallel light falling on it. The method thus has nothing to do with shadows cast by hill features. Oblique hill shading is customary. It usually assumes that the incident light is inclined at 45° to the vertical, and, for a reason not clear, the convention has arisen that the light is assumed to come generally from a northwesterly direction. This convention is so strongly entrenched that if an oblique hill shaded map is turned around so that south is at the top of the map, many people have difficulty in retaining the plastic impression. In practice, the optical theory is not always strictly followed. Oblique hill shading is a specialized art, brought to a high degree of effectiveness notably in Switzerland and, during the 20th century, increasingly used on topographical maps in combination with contouring. The method loses its effectiveness as scale becomes smaller, though it can always be made to give a generalized plastic effect to the major mountain masses. In inexpert hands, the method can be misleading; for example, the artist may overemphasize the relief in gently undulating country so that it looks as rugged as more mountainous country.

Hachuring.—Hachuring consists in laying down a pattern of short lines to indicate the directions of slopes. By varying the width of the lines, some indication of steepness of slope is also obtained. Well-executed hachuring reveals the character of the relief and when used as a supplement to contouring can be effective. Though this method should allow for a more precise interpretation than hill shading does, and was used extensively on topographical maps in the 19th century, it is more difficult to execute properly and in the 20th century has largely been abandoned as a technique.

Other Methods.—There are other methods of relief representation, many of which are ingenious and some of which are statistical or diagrammatic, but only two will be mentioned here. One is a technique that characterizes land form features on small scales by perspective or semiperspective symbols, a qualitative method requiring skill and considerable knowledge of geomorphology. The second is the depiction of zones of slope by succession of tints. This method, though not in common use, gives on very small scales a revealing characteristic pattern of landscape when combined with the representation of drainage features; it may be useful, for example, in assessing the suitability of regions for development projects such as housing.

5. Terrain Models.—These are three-dimensional maps, which not only supply the user with a real plastic effect rather than the simulated effect obtained by hill shading, but also make possible the adequate representation of steep slopes and vertical precipices. The earth is, however, a remarkably smooth surface in respect to its radius. The elevation of Mt. Everest is only about $\frac{1}{4}$ of 1% of the earth's radius, and on a scale of $\frac{1}{1,000,000}$ its elevation is represented by about 0.35 in. In order, therefore, to give emphasis to the relief on models, the vertical scale on any but extremely large-scale models is usually made larger than the horizontal scale. This "vertical exaggeration" usually is increased as the horizontal scale becomes smaller. One effect of vertical exaggeration, not often noted, is that gentle slopes are given more exaggeration than are steep slopes. Obviously a vertical slope cannot be exaggerated by increasing vertical scale over horizontal scale.

Though vertical exaggeration actually distorts the representation of slope, the proponents of terrain models do not consider this to be a defect. In fact, in some cases, the vertical exaggeration is

purposely varied with slope to emphasize the gentle slopes still further.

The principal difficulty in constructing a terrain model lies in the making of the master base model itself. Though this process is comparable to sculpturing, modern technology has reduced it to the point where it is nearly automatic. Modern methods for reproducing printed terrain models quickly and in quantity, which began to develop about the time of World War I and were greatly improved during and after World War II, involve printing the maps on flat sheets of opaque plastic. The sheets are vacuum pressed onto the master model or a facsimile and heat is applied so that the plastic nearly melts and molds itself to the model. When it is cooled and removed, a lightweight printed model is produced.

6. Geographical Names.—Names of places are established, for the most part, from a multitude of complex considerations. Only an indication of the intricacies of toponymy (the study of place names) can be attempted here. If all nations used the same alphabet and spoke and wrote in one language, the rendering of geographical names on maps would be a comparatively simple matter, though this is not the only difficulty in place names: the same name is often given to different places (for example, Boston, Columbus, Washington and Lincoln); sometimes local usage varies from official usage (a mountain may be called by different names by the peoples living on opposite sides of it); the same place name has various spellings or is entirely different in different languages ("Wien" in German is "Vienne" in French, "Vienna" in English and "Becs" in Hungarian, and the English channel and the Straits of Dover in English become respectively La Manche and Pas de Calais in French).

The greatest difficulties in the rendering of geographical names, however, occur because there are numerous different scripts and because sounds in one language may have no adequate representation in the alphabets used for another language. Sometimes names are translated; the Cabo da Boa Esperanca in Portuguese, for instance, has become the Cape of Good Hope in English. More often, the transcription of alphabets or the transliteration of syllabic symbols is attempted.

In passing, it may be noted that explorers not sufficiently versed in local languages to fully comprehend answers to questions have been known to place on their maps absurdities with meanings such as "I don't know."

In the English-speaking world, since the beginning of the 19th century the Royal Geographical society has pioneered in establishing order in the rendering of geographical names, and in 1919 it established the Permanent Committee on Geographical Names. In the United States, the Board on Geographic Names was established under a slightly different name in 1890. These two organizations deal specifically and exclusively with the subject, and considerable co-operation and co-ordination have been effected between them.

C. SPECIAL-PURPOSE MAPS

1. Categories.—Special-purpose maps fall into several distinct categories. Air navigation charts and road maps, for instance, comprise one. Another divides the land up into areas or regions according to a system of classification. For example, a geological map may show the areas occupied by different kinds of outcropping rock. Land-cover maps may show forests, grasslands, swamps, tundra or deserts. The soil map is another important type. Such maps as these are compiled from intensive observations in the field. Other types within this category may have been derived from a combination of field observations and statistical analysis; for instance, maps may show the land divided up into climatic regions based on a complex of criteria, or may divide the land according to the predominance of certain crops or of certain races of mankind.

A map may show the variation in the amount of intensity of a single phenomenon. This is perhaps best exemplified in climatic maps that show the distribution of such items as temperature, barometric pressure or rainfall averaged over periods of time. Such maps are compiled from measurements at a discrete num-

ber of points. When it is possible to do this, as it is for numerous kinds of phenomena, it is also permissible to interpolate isolines, or lines of equal intensity, in the same way as contour lines may be interpolated from spot elevations.

Another category of special-purpose maps comprises those that show flow lines, such as sea currents or winds. The rate or amount of flow can be indicated. For example, a useful type of map for analyzing road traffic problems is one that differentiates between the number of cars passing over different sections of a road system in a given period. One way of depicting this is by regulating the representation of the width of the roads in proportion to the amount of traffic carried.

2. Density Maps.—Density is a measure of the number of items in a unit space or area, such as a square mile. The difficulty in depicting the density of a population (whether cattle or oak trees or human) on a map is that the necessary statistical information is summated over areas varying in size and shape; e.g., minor civil divisions. If the population densities in counties are given as so many items to a square mile, there is no assurance that these items are regularly distributed over each area. In fact, quite a different picture generally will be obtained if it is possible to obtain statistics for areas considerably smaller than counties.

Because density is associated with area, the most valid method of indicating it on a map is to show by colour or pattern differentiation the density variation among the statistical areas; but this method may fail to give a revealing over-all picture graphically. If, on the other hand, the centres of the statistical areas are adopted as points of average density and isolines are then interpolated, the pattern of the isolines will depend to a large extent on the size and shape of the areas and on the compiler's judgment. Isoline patterns of density, therefore, must be viewed with suspicion except insofar as they show very general relationships.

The dot method in its simplest form would show each individual item in its correct position, and a map thus compiled would give a revealing over-all picture of density. However, because of considerations such as scale and the impossibility of collecting the necessary information, individuals are usually grouped, and each dot may represent hundreds or even thousands of individual items not necessarily at the mean position of the group. This method thus requires skill and judgment to be successful.

D. MAP PROJECTIONS

1. Basic Concepts.—It is impracticable to record detailed surveys on topographic and cadastral scales and, in general, to compile maps from these surveys on anything but a plane surface. Nevertheless, these surveys and compilations must be tied to geodetic control points, whose positions have been determined with reference to the surface of an oblate spheroid which is a close approximation to the form of the earth. In practice, this problem is solved by expressing the positions of the control points in terms of their projected positions on a plane.

Though the subject of map projections is a highly specialized branch of applied mathematics, the principles involved and the properties of most map projections can be described in terms of elementary geometry and trigonometry by assuming the earth to be a sphere. (See SPHERE; SURFACES.) The following concepts and definitions are valid on the basis of this assumption.

The geographical poles (north and south) lie on the surface of the terrestrial sphere on its axis of rotation. The plane of the equator is perpendicular to this axis. The equator is only one of an infinite number of circles, called great circles, which divide the surface of the sphere into two equal parts. All other circles on

MODIFIED FROM JOHN O. STEWART & NEWTON L. PIERCE "MARINE AND AIR NAVIGATION" (1944)

FIG. 6.—SOLID AND LONG-DASH LINES INDICATE GREAT CIRCLES. SHORT-DASH LINES ARE SMALL CIRCLES. AND THE PORTION BETWEEN A AND B IS A GREAT CIRCLE ARC

the surface of the sphere are called small circles. Two points on the surface of the sphere can always be connected by a great circle, and the shortest surface distance between them lies along it. The portion of a great circle between two points is called a great circle arc. Because an arc subtends an angle at the centre of the sphere, it is convenient to express it either in arc measure (degrees, minutes and seconds) or in circular measure (radians). (See RADIANT MEASURE.)

At all points on the surface of the terrestrial sphere, the vertical direction is assumed to be perpendicular to the surface. A horizontal line or area, therefore, lies on or parallel to this surface. Horizontal position on the terrestrial sphere is stated in terms of the geographical co-ordinates latitude and longitude (see LATITUDE AND LONGITUDE). Lines of equal latitude are small circles parallel to the plane of the equator and are thus frequently referred to as parallels of latitude. Latitude as shown on maps varies between 0° on the equator and 90° N. and 90° S. at the poles.

Meridians are arcs of great circles connecting the two geographical poles. The angular difference between two meridians at the poles is called a difference of longitude. By international agreement in 1884, the meridian passing through the Greenwich observatory near London, Eng., long used by the British as a zero or prime meridian, was accepted as standard, and by 1950 the system was in universal use on the maps of practically all nations.

Longitude on maps is given almost invariably in arc measure up to 180° E. or 180° W. of the prime meridian.

The azimuth or direction at one point A of a second point B on the terrestrial sphere (see fig. 6) is the angle usually measured clockwise from the north direction of the meridian passing through A and the great circle arc passing through both A and B. Because of the convergence of the meridians toward the poles the reverse azimuth of A from B is in general not equal to the azimuth of B from A plus 180°.

The sides of a spherical triangle consist of great circle arcs. It is shown in spherical trigonometry that the sum of the angles of any spherical triangle exceeds 180°, and this excess is in direct proportion to the area of the spherical triangle. Thus, it is impossible to represent any spherical triangle on a plane without distorting some of the angles and sides. The two-point equidistant and two-point azimuthal projections are simple kinds of map projection that demonstrate this clearly. In both projections two points on the sphere are chosen and shown on a map at their correct scale distances apart. In the first projection, the position of any other point is mapped so that it is shown at its correct scale distance from both points. In the second projection, it is mapped so that its azimuths from the two points of origin are correct.

FIG. 7.—(A) MADEIRA PLOTTED SO THAT ITS AZIMUTHS FROM LONDON AND NEW YORK ARE CORRECTLY SHOWN; (B) MADEIRA SHOWN AT ITS CORRECT SCALE DISTANCE FROM BOTH POINTS

portion to the area of the spherical triangle. Thus, it is impossible to represent any spherical triangle on a plane without distorting some of the angles and sides. The two-point equidistant and two-point azimuthal projections are simple kinds of map projection that demonstrate this clearly. In both projections two points on the sphere are chosen and shown on a map at their correct scale distances apart. In the first projection, the position of any other point is mapped so that it is shown at its correct scale distance from both points. In the second projection, it is mapped so that its azimuths from the two points of origin are correct.

2. Properties of Projections.—A representation of meridians and parallels of latitude at regular intervals is often referred to as the map projection itself; more correctly, it is called a map graticule. A primary classification of map projections separates them into three groups: (1) equal-area, sometimes called equivalent or authalic; (2) conformal, frequently called orthomorphic; and (3) any other types. On equal-area projections the areal scale is constant from point to point; linear scale at a point, however, will in general vary with direction, and differences of direction will be distorted. On a conformal projection, the linear scale at a point is constant in all directions and angles around a point are shown correctly; in general, however, the scale varies from point to point. It is obvious that no map projection can be both equal-area and conformal.

The properties of map projections can be precisely described mathematically with the aid of the infinitesimal calculus. A. Tissot in his *Mémoire sur la représentation des surfaces et les projections cartographiques* (1881) demonstrated that when projecting a surface onto a plane in a continuous fashion so that there is a one-to-one point correspondence, an elementary (infinitesimally small) circle becomes an ellipse. Such an ellipse has consequently been called a Tissot indicatrix. It is possible, once a map projection has been defined, to calculate the relative dimensions of the elliptical indicatrix and the orientation of its major and minor axes for any point mapped. On an equal-area projection, the area enclosed by the ellipse will be the same as that within the elementary circle, but the shape of the ellipse and its orientation will vary from point to point. On a conformal projection the ellipse degenerates into a circle, but its relative size will vary from point to point. On all other projections the ellipse does not degenerate into a circle, nor is it equal-area at all points.

It is a necessary, but not a sufficient, condition for conformality that the meridians and parallels on a map projection intersect at right angles as they do on a sphere. However, conformal map projections are no exception to the general rule that shapes of areas of considerable extent will be distorted.

Any properly conceived map projection can be defined by means of a pair of mathematical formulas which enable the positions of the intersections between meridians and parallels of latitude to be calculated in terms of plane co-ordinates on the map projection. When these calculated positions have been plotted, the graticule is obtained by drawing smooth, continuous curves through all the points plotted for each meridian and for each parallel of latitude.

3. Perspective Projections.—Certain projections can be constructed by using the principles of perspective (*q.v.*). Points on a sphere of nominal scale are projected onto a plane tangent to it by perspective rays from a perspective centre.

The orthographic projection puts the perspective centre at infinity. Thus, the projecting rays are parallel to each other and perpendicular to the plane of projection. A map plotted on this projection gives the impression of the world as seen at a great distance away.

The stereographic projection places the perspective centre at the point on the sphere diametrically opposite the point of tangency of the plane of the projection. This projection is conformal and has in addition the remarkable property that all great and small circle arcs on the sphere are shown as either arcs of circles or as straight lines on the projection.

The gnomonic projection places the perspective centre at the centre of the sphere. It has the property that all great circle arcs are shown as straight lines, and this is useful for laying out the shortest route between two points. An innumerable variety of projections that will show great circles as straight lines can

FIG. 8.—ORTHOGRAPHIC, STEREOGRAPHIC AND GNOMONIC PROJECTIONS OF A SPHERICAL SURFACE ONTO A TANGENT PLANE BY PERSPECTIVE RAYS

FIG. 9.—THE DEVELOPMENT OF A PERSPECTIVE CONIC PROJECTION (see TEXT)

be derived from the gnomonic by making other perspectives of the plane of the gnomonic onto other planes inclined to it. This is because any projection of one plane onto another transforms straight lines into straight lines. Two-point azimuthal projections result from this procedure, and any particular case can be derived easily by orthogonal projection.

With the perspective centre at the centre of the sphere, a projection can be constructed onto a conical surface tangent to the sphere along any small circle. By cutting the conical surface along any straight line from the vertex, it can be developed into a plane by unrolling it. In such a projection, the scale ratio along the circle of tangency is equal to one. This circle is sometimes called the standard small circle or standard parallel when the centre of the projection is at one of the geographical poles. In

as straight lines and that concentric circles around the origin are shown as arcs of concentric circles. Geometrically, they vary one from another only in the manner in which the concentric circular arcs are spaced and in the value adopted for the constant w .

When n equals one the various projections are called azimuthal (azimuths of all points are correct at the centre) or zenithal (British usage). The group includes the orthographic, stereographic and gnomonic described above, the important azimuthal equal-area projection devised by Johann Heinrich Lambert and the azimuthal equidistant projection which represents all points at their correct distances to scale from the centre. When the centre of an azimuthal projection is at one of the geographical poles, it is called a polar azimuthal projection; when on the equator it is called a normal or equatorial azimuthal projection. With any other centre it is called an oblique or horizon azimuthal projection.

Mercator and Other Cylindrical Projections.—When n is zero the various projections are called cylindrical; and normal, transverse and oblique when the equator, a meridian and any other great circle is represented by the central straight line. The normal cylindrical projections in common use are the Mercator, the simple or equidistant (parallels of latitude are spaced correctly to scale), Gall's stereographic and Miller's modified Mercator. The equal-area variant is little used for world maps because the spacing of the parallels of latitude must of necessity become extremely compressed in high latitudes. Gerardus Mercator's (*q.v.*) famous projection, besides being conformal, shows all lines of constant azimuth (rhumb lines or loxodromes) as straight lines. These properties combine to make this projection more useful for navi-

FIG. 10.—FIVE AZIMUTHAL PROJECTIONS FROM THE POLAR ASPECT. CLOCKWISE FROM TOP RIGHT THEY ARE STEREOGRAPHIC, EQUAL-AREA, EQUIDISTANT, GNOMONIC, ORTHOGRAPHIC

fig. 9(B) AA' is the diameter of a circle of tangency and V is the vertex of the cone. The projected distance V is equal to the tangent of the angle VCA . When the cone is unwrapped as in fig. 9(C) all circles parallel to AA' will be shown as concentric arcs of circles centred on V . All great circles passing through P on the sphere will be straight lines passing through V . Their angles of intersection at V will be smaller than on the sphere. It can be shown that this angular compression, called the constant of the cone, is equal to the cosine of the angle VCA . Thus this constant, usually denoted by n , varies between the limits one and zero. When n is 1, the vertex V coincides with the point P and the gnomonic projection results. When n is zero the vertex V can be considered as being at infinity so that the cone becomes a cylinder and the resulting projection is called a perspective cylindrical projection. The great circles passing through P and the small circles concentric around P are shown in this cylindrical version as sets of parallel straight lines, one set cutting the other at right angles.

Except for the limiting case of the gnomonic projection, these perspective conical projections have no practical value. They

FIG. 11.—A POLAR AZIMUTHAL EQUIDISTANT PROJECTION OF THE WORLD, WITH THE SOUTH POLE REPRESENTED AS THE BOUNDARY LINE OF THE PROJECTION

are, however, the genesis of a much larger category of projections that fall under the general heading of conic.

4. Conic and Related Projections.—Conic projections include equal-area, conformal, so-called equidistant and other variants. All have the common characteristics that great circles radiating out from the origin, corresponding to V in fig. 9(B) in the perspective variant, are shown

gation than the gnomonic even though the rhumb line route between two points is longer than the great circle route.

When n is greater than zero and less than one it is always possible to select two small circles less than 90° from and concentric about a centre as standard. Thus, these may be chosen best to suit a given region. In the normal cases when one of the geographical poles is the centre, the important variants of the conic projections with two standard parallels are Alber's equal-area, Lambert's conformal and the "simple," which last has the property that the meridians as well as the two standard parallels have constant scale ratios equal to one.

Closely related to the conic family of projections are Bonne's equal-area and the polyconic projections. In Bonne's projection a standard parallel is developed as in the case of the perspective conic. All other parallels are concentric arcs of circles of constant scale ratio equal to one and spaced along a central straight line meridian at their correct scale distances apart. All other meridians are curved lines which do not cut the parallels of latitude at right angles. One limiting case of this projection is when the equator is taken as the standard parallel. The resulting projection is called the sinusoidal

FIG. 12.—SPACING OF PARALLELS FOR FIVE NORMAL CYLINDRICAL PROJECTIONS

From left to right: cylindrical equal-area, simple, Miller's modified Mercator, Gall's stereographic and Mercator

or Sanson-Flamsteed. In this case, the equator, the parallels of latitude and the central meridian are straight lines true to scale and the remaining meridians are sinusoidal curves.

One form of the polyconic projection is developed by constructing the parallels of latitude as if they were standard parallels on a perspective conic and then spacing them at their correct scale distances apart on a central straight-line meridian. The other meridians are curves and the projection is neither conformal nor equal-area.

5. Shape of World Maps.—Many other types of map projections have been conceived, but only a few can be mentioned here. Many world map projections are characterized by the shape of the area on the map which portrays the whole sphere. It is possible, for example, to obtain conformal maps of the world within the confines of a square, a rectangle, a circle and an ellipse.

FIG. 13.—SINUSOIDAL OR SANSON-FLAMSTEED EQUAL-AREA PROJECTION OF THE EARTH

MODIFIED FROM IRVING FISHER & O. M. MILLER "WORLD MAPS AND GLOBES"

FIG. 14.—ADAM'S CONFORMAL PROJECTION OF THE EARTH WITHIN AN ELLIPSE

Two types of equal-area projection which represent the whole earth within an ellipse are the Mollweide and the Hammer (often wrongly called the Hammer-Aitoff or even the Aitoff). The Mollweide in its normal form represents the equator and parallels of latitude as parallel lines. The Hammer projection encloses the whole world within an ellipse of the same dimensions but, in this case, the parallels are curved. Both these projections have been used in their oblique forms with centres at latitude 45° N., and when the central meridian is the Greenwich meridian or one

FIG. 15.—HOMOLOGRAPHIC OR MOLLWEIDE'S EQUAL-AREA PROJECTION OF THE EARTH WITHIN AN ELLIPSE

somewhat west of it, the general relationships between the land masses on the earth are shown well.

6. Discontinuities.—A spherical surface is continuous. When it is projected onto a plane, this continuity must be interrupted at least at one point, more often two points, and frequently along the whole or part of one or more small or great circles. Azimuthal equidistant and equal-area projections interrupt the sphere at only one point, which is diametrically opposite the centre of projection. This point becomes the boundary of the projection. The cylindrical projections are interrupted at two points diametrically opposite one another. These become straight lines on the map unless, as in the case of the Mercator projection, the points

FIG. 17.—OBLIQUE MOLLWEIDE PROJECTION WITH CENTRE AT 45° N.

project at infinity. The cylindrical projections, however, have the useful property of being periodic or continuous in the direction of their central lines. The world shown enclosed in an ellipse is interrupted along the half of one great circle. Sometimes interruption is purposely introduced in order to reduce over-all shape distortion. This is done usually in the ocean areas in order to show the principal land areas with good shape characteristics. It is an open question whether much is to be gained by sacrificing continuity when these interruptions are asymmetrical.

When the nominal scale of a map is so large that the whole world or the region to be mapped cannot be shown on one sheet, another problem of continuity occurs. A single projection can be used so that all sheets can be assembled together. If, however, a separate projection is used for each sheet so that scale anomalies

BY COURTESY OF U.S. DEPARTMENT OF COMMERCE, COAST AND GEODETIC SURVEY

FIG. 18.—SIMPLE CYLINDRICAL EQUAL-SPACE PROJECTION OF THE EARTH

and shape distortion are limited to the single sheets, then, though it is possible to maintain fit along the edges of adjacent sheets, over-all continuity will be lost. Such a system is adopted, for example, for the sheets of the International Map of the World on the scale of 1:1,000,000. Compromises between the two systems are to be found in the use of the polyconic projection for the topographical sheets of the United States geological survey. In this system, sheets falling into one zone of longitude are on the same projection. The World Aeronautical Charts are on a system of conformal conic projections with two standard parallels. Here sheets falling into one zone of latitude are on the same projection.

7. Modern Uses.—Map projections in actual use to any great extent are limited in number, especially in the case of large-scale maps. On topographic and cadastral maps, the fact that the shape

FIG. 19.—GOODE'S HOMOLOSIONE EQUAL-AREA PROJECTION

of the earth more nearly corresponds to an oblate spheroid than to a sphere is invariably taken into account. Equal-area projections such as Bonne's and nonconformal projections such as the transverse simple cylindrical (Cassini) were sometimes adopted for the maps of small countries. From the turn of the 20th century, however, the trend has been to base large-scale maps on conformal projections such as the transverse Mercator for regions having their greatest extent north and south; on the Lambert conformal conic with two standard parallels for regions having their greatest extent east and west, and the oblique stereographic for regions roughly circular. For example, until 1935 the topographical sheets of the United Kingdom were on the Cassini projection but after that time, the transverse Mercator was adopted. The Laborde projection used for mapping Madagascar is essentially an oblique Mercator projection. The latter type also has been used for strip maps along established air routes.

FROM IRVING FISHER & O. M. MILLER "WORLD MAPS AND GLOBES"

FIG. 20.—TWO METHODS OF ASSEMBLING SHEETS OF THE INTERNATIONAL MAP OF THE WORLD, BOTH INVOLVING DISCONTINUITY

For world maps on one sheet equal-area map projections are in great demand because they make possible an over-all visualization of the relative sizes of regions. Cylindrical projections often are used for general reference maps over the populated areas of the world, because parallels of latitude and meridians are shown in the form of a rectangular network. Except for special purposes, conformal map projections are not suitable for world maps. On the other hand, they have certain technical advantages over other types for compiled maps on intermediate scales such as 1:5,000,000.

Principally, they permit compilation from sources on large-scale maps having little significant shape distortion to be accomplished quickly and accurately, since small areas on the large-scale maps, when suitably reduced in size, can be made to fit into the conformal small-scale projection with little adjustment.

A rectangular, usually square grid often is superimposed or indicated on a map in addition to the map graticule. Grids are useful for determining the relative positions of points in terms of map rectangular co-ordinates on large-scale maps of limited areas when the map projection distortion is relatively insignificant. They are also useful for locating place names on maps

from an alphabetical index with references to the grid areas. The mathematical aspects of projection are discussed further in ANALYTIC GEOMETRY; DESCRIPTIVE GEOMETRY; DIFFERENTIAL GEOMETRY; GEODESY; TRIGONOMETRY; *Spherical Trigonometry*.

E. GLOBES AND GAZETTEERS.

Terrestrial globes are maps of the earth on spherical surfaces, and because they show shapes without distortion, they are ideal objects wherewith to learn and visualize geographical relationships. However, they are difficult to construct precisely, and few have been made with a diameter of more than six feet. The schoolroom or office globe is generally not more than 18 in. in diameter and often less. It must be appreciated that a map on a globe cannot be constructed until geographical features have been depicted on flat maps. When printed information is on a globe, this usually means that flat maps of narrow sections of the earth.

FIG. 21.—SIMPLE GRID REFERENCING SYSTEM
ANON followed by A3 in an alphabetical index indicates the approximate location of the place on the map (see text)

FIG. 22.—THE WORLD DIVIDED INTO 12 GORES SUITABLE FOR MOUNTING ON A GLOBE

usually gores, have been cut out and stuck on.

Gazetteers are the antitheses of globes. They list place and physical names alphabetically and also supply in varying degrees written information concerning the places or features referred to. The minimum information given in any gazetteer is the location of named places. Additional information may include the size and population of towns, cities, states and countries, their industries and histories, and descriptions of physical features such as rivers and mountain ranges. The more detailed gazetteers are usually national.

Maps are the practical compromise between globes and gazetteers. They are not limited in scale as are globes and they show spatial relationships which gazetteers cannot. (O. M. M.)

II. HISTORY

Human existence would be impossible without knowledge of the sort that maps convey. Primitive folk carry such knowledge in their minds—mental “maps” of the areas where they live or hunt, fish or fight. As culture develops, such mental maps no longer suffice, and real maps are made to meet countless practical needs, to satisfy scientific curiosity and to give aesthetic pleasure. The history of maps and of all that they have meant to mankind is therefore an immense field, potentially as vast, perhaps, as the history of art or of literature.

Like modern science and technology, modern cartography throughout the world is essentially of western origin. It represents a phase in the development of a cartographic tradition that stems from ancient Greek times and that may have been stimulated in its beginnings by borrowings from the earlier cultures of southwestern Asia and Egypt. Four distinctive periods may be roughly blocked out (with arbitrary dividing dates): (1) the Greco-Roman (600 B.C. to A.D. 400); (2) the medieval (400 to 1500); (3) the early modern (1500 to 1700); and (4) the modern (after 1700).

No maps, at least in their original form, have come down to us from the Greco-Roman period. Hence the nature of Greco-Roman cartography can only be inferred from what ancient authors wrote about geography and maps and from examination of a few extant medieval versions of ancient maps. There is enough evidence, however, to show that, until about the mid-2nd century of the Christian era, cartography made substantial if often halting progress and that many of its basic mathematical problems were recognized and understood, if not fully solved. Thereafter several centuries of retrogression and stagnation ensued.

Of the many late medieval and early modern maps that have been preserved, a goodly proportion have been reproduced and studied in detail from the beginning of the 19th century. Indeed, of the entire field of cartographic history, this part has been cultivated in by far the most systematic and intensive manner, and for two chief reasons: (1) medieval and early modern maps have, to our eyes, a quaintness, a naïveté and an artistic quality that make them exceedingly attractive; and (2) perhaps more significantly, early modern maps, in a way and to a degree achieved by the maps of no other age, record and illumine events of supreme historical importance—the voyages and travels of the great age of geographical discovery and the widening of man's geographical horizons that they brought about.

During the modern period maps have increasingly come to be based on accurate measuring, counting and computing, rather than mainly on speculation and guesswork. Modern cartography has stressed the scientific and the practical functions of maps at the expense, if not to the total neglect, of their aesthetic functions. The development of scientific instruments and statistical techniques and the accumulation of scientific data have enormously enlarged the variety and quantity of mappable facts and consequently of maps and their uses. So many and so diverse are these uses today that maps have become indispensable.

A. PRIMITIVE PEOPLES

Travelers have described the remarkable ability of certain primitive folk—particularly those who, like the Eskimos or Bedouins or Polynesians, wander far and wide—to draw sketch maps of their territories, and a goodly number of crude maps that such people have carved on wood or bone or put together with sticks and shells or made in other ways may be seen in ethnographical museums. Better maps were produced by early civilized peoples—Egyptians, Babylonians, Chinese, Aztecs and Peruvians of the Inca empire. Their cartography was practical: they made cadastral plans, real-estate plots, specifications for the construction of temples, palaces, canals, roads—the equivalent of the blueprints of modern engineers. None of these peoples except the Babylonians gave much heed to speculative mapping of the world as a whole. A diagrammatic world map on a late Babylonian tablet (6th century B.C.), suggests that the Ionian Greeks may have borrowed from, or shared with, the Babylonians the long-lived belief in a flat, disk-shaped earth surrounded by an ocean stream and bordered on the north by a great range of mountains. (J. K. W.)

B. GREECE AND ROME

The Greeks, more than any other people in the ancient world, were fitted to pursue and develop geographical knowledge. Shortage of arable land and adverse economic or political conditions at home induced impoverished or adventurous men to seek a livelihood overseas. Travel tales of Jason and his Argonauts and of Odysseus indicate that the Greeks were attracted to sailing from early times. During the great age of colonization (8th to 6th centuries B.C.) they established maritime settlements from the east coast of Spain to the far reaches of the Black sea. Miletus, the leading colonizing city, alone founded more than 40 city-states. Daughter colonies usually maintained close relations with the mother city, and these opportunities to exchange informa-

BY COURTESY OF THE LIBRARY OF CONGRESS

FIG. 23.—HECATAEUS' MAP OF THE WORLD

BY COURTESY OF THE LIBRARY OF CONGRESS

FIG. 24.—HERODOTUS' MAP OF THE WORLD

tion about distant regions greatly stimulated the Greeks to speculate about the shape of the world and the causes of physical phenomena.

By 600 B.C. Miletus had become the leading centre of cosmographical speculation and geographical knowledge. Thales of Miletus (*q.v.*) was the founder of natural philosophy. His pupil Anaximander (*q.v.*), also of Miletus, was reputed to have been the first to publish a geographical map. Hecataeus of Miletus (*q.v.*) may have produced the first book on geography (*c.* 500 B.C.), surviving fragments of which make it possible to reconstruct the author's conception of the earth (*fig. 23*) as a circular plane, surrounded by a continuous belt of ocean. He located Greece at the centre. A generation after Hecataeus, the celebrated historian Herodotus (*q.v.*) traveled widely and had more precise and extensive knowledge of geography than did his predecessors. He expressed contempt for the map makers of his day who supposed Europe and Asia to be of equal size and represented the earth as circular, surrounded by an assumed ocean. He himself presumed to know the size and actual shape of each region. Herodotus' *History* includes accounts of the Phoenician circumnavigation of Africa (*c.* 600 B.C.) and of the voyage of Scylax down the Indus

river, concrete evidence of the broadening effect that reports of early explorations were having upon Greek geographical horizons. Herodotus found no evidence for a northern ocean but concluded from the report of the Phoenician voyage that the southern ocean extended from India to Spain. He regarded the Caspian as an inland sea, opposing the prevailing view that it was a gulf of the northern ocean (*fig. 24*).

Numerous other military and sailing expeditions, conducted by Greeks or reported by Greek writers, served to enlarge geographical conceptions. Early in the 6th century B.C. two Carthaginian navigators cruised along the Atlantic coast, Hanno along west Africa to Cape Palmas and Himilco along the Spanish and Gaulish coasts to Brittany. Xenophon's account of the campaign of 10,000 Greek mercenaries (401 B.C.) against the Persian king, deep into Persia, and of their subsequent retreat across Armenia to the eastern shores of the Black sea, provided much geographical information. Far more important to geographers than these expeditions was the campaign of Alexander the Great, who in the 4th century penetrated to the shores of the Caspian sea and into northern India, sailing down the Indus, and dispatched his admiral Nearchus with a fleet along the coast of southern Asia and the Persian gulf while he was returning with his army through Gedrosia and Persia. A few decades later, Megasthenes, a Greek ambassador sent by Seleucus I to King Chandragupta, resided at his court on the Ganges river and wrote a book on India. About this time the Greek navigator Pytheas of Massilia rounded Spain and circumnavigated Britain; his precise recording of the sun's declination in northern latitudes served as the basis for Eratosthenes' research in mathematical geography.

Meanwhile a city was being built at Alexandria which was to serve as the Greek administrative capital of Egypt and to become the focal point of the highest developments of Greek science. Alexandria quickly became the new centre of geographical knowledge and research. Eratosthenes (*q.v.*), head of its famed library, a mathematician as well as scholar, succeeded in measuring the earth's circumference within an error of a few hundred miles, and employing the recorded observations of Pytheas and others who had ascertained the latitudes of various places on the globe by measuring the sun's angle, he was able to produce a map based

BY COURTESY OF THE LIBRARY OF CONGRESS

FIG. 25.—SECTION OF THE PEUTINGER TABLE

upon astronomical principles (c. 225 B.C.). Hipparchus, greatest of Greek astronomers and a leading mathematician, criticized this work (c. 130 B.C.), rebuking Eratosthenes for basing his map upon previously determined positions of latitude of a small number of places. He proposed instead a grid scheme of 360° of latitude and longitude for a map based solely upon astronomical observations, devising a method of determining longitudes by timing observations of eclipses. But precise determinations of geodetic positions depend upon precise instruments of timing and observation, and consequently Hipparchus' scheme could not be successfully applied until modern times. Nevertheless he laid the foundations for scientific cartography.

Poseidonius (q.v.), not himself an important original thinker, indirectly exerted an extraordinary influence upon the science of western Europe until the Renaissance. The intellectual age to which Poseidonius belonged was lacking in creative genius. Many of the best minds were engaged in synthesizing and reconciling the more plausible views of earlier Greek philosophers and scientists. Of these compilers Poseidonius proved to be the most apt at assimilating the work of his predecessors and embodying their findings in readable compendiums of knowledge in many fields. The Greek compilations of this period provided the bulk of the scientific material of leading Roman intellectuals—Varro, Lucretius, Cicero, Seneca and Pliny the Elder—who in turn transmitted this body of handbook information to the Latin middle ages. And so, whereas Greek science went on to reach new heights at Alexandria in the 2nd century A.D. and to flourish at a high level at Byzantium and among the Arabs during the middle ages, scientific studies in the Latin west stagnated for 1,000 years in the hands of bookish laymen who were satisfied to copy or revise stock material largely originating in Greek compendiums of the Poseidonian age. The sort of influence Poseidonius wielded was demonstrated when he made a revised calculation of the circumference of the earth, reducing Eratosthenes' nearly correct estimate by over one-fourth; two centuries later, Ptolemy preferred Poseidonius' estimate. Ptolemy's acceptance of a smaller figure of the earth's dimensions and his enormous reputation as a geographer in the 15th century afforded Columbus encouragement to attempt a westward sailing to the Indies.

Strabo's *Geography*, in 17 books, is one of the two major works on the subject to survive from antiquity. He presents conventional handbook information on mathematical geography, sometimes without understanding it, yet has the temerity to criticize Pytheas, Eratosthenes and Poseidonius. Strabo traveled widely in Mediterranean regions and his extensive geographical treatment of the countries of the known world contains valuable information. His book is the chief source on the history of earlier geography.

The Romans were not interested in the theoretical aspects of geography. While the Greeks were attempting to fix locations on the earth's surface and to ascertain the dimensions of the known world and of the entire globe, the Romans were producing crude but practical maps of battlefields and itineraries. As the empire expanded, the realization grew that maps were essential not only for military operations but for provincial administration as well. The emperor Augustus put his general Marcus Agrippa in charge of a mapping project of the entire empire, an undertaking that teams of surveyors required almost 20 years to complete. A survey of over 50,000 mi. of paved highways, recording mileages marked on milestones, served as a framework for the map, and other vital information, such as junctions of rivers and highways, provincial boundaries and facilities available to travelers in towns and cities along the highways, was compiled in the survey. At the conclusion a large master map, engraved in marble, was erected on a wall near the Roman forum. Countless copies were made on papyrus rolls and distributed among military and administrative officers.

A late copy of this map, known as the Peutinger Table (q.v.; fig. 25), has survived, presumably belonging to the 3rd century A.D., although the present copy was reproduced in the 13th century. Because the map is in the form of a parchment roll, 22 ft. long and 13 in. wide, designed to be folded in a portfolio, it grossly distorts the shape of the known world. Roman officials, interested

only in the data recorded on the map, were not disturbed by its elongated form, which made rivers like the Nile take an east-west direction and made the Mediterranean and Black seas resemble canals. The 11 sheets of the map include the territory from the eastern tip of England and the Pyrenees to China and the supposed shores of the eastern ocean. A missing segment included the British Isles and Iberian peninsula. The segment in fig. 25 shows the southeastern tip of Britain, the northeastern part of Spain, and Gaul. The map contains 534 illustrations: 311 in Europe, 62 in Africa and 161 in Asia. The vignettes may have indicated the kinds of facilities available in towns; e.g., 33 temples and 38 bathing establishments appear on this map. Distances between towns along the highways are fairly accurately recorded in Roman miles.

Meanwhile, scientific studies continued to flourish among the Greeks, particularly at Alexandria. Geographical and astronomical research reached its apex in antiquity in the work of Ptolemy (q.v.), whose *Geography* (c. A.D. 150), in eight books, culminated the researches of his predecessors. Ptolemy appeared to the ancient world to have fulfilled Hipparchus' scheme of constructing a map of the known world from geodetic positions located precisely upon a network of 360° of latitude and longitude. Book I of his *Geography* discusses the principles of mathematical cartography and the methods of representing a spherical surface on a plane. The remaining seven books are little more than a list of some 8,000 place names—cities, islands, mountains, river mouths, etc.—whose locations were presumably determined even to minutes and seconds. Ptolemy's theory was excellent but his practice shoddy. Actually he had almost no scientific cartographic data—a few latitudes determined astronomically and a token attempt to ascertain longitudes by timing of eclipses. Instead he depended mainly on dead reckoning from reports of travelers. His book was accompanied by an atlas of sectional maps, 10 for Europe, 4 for Africa, 12 for Asia and a map of the known world. A modern reconstruction of his world map, based upon his 8,000 co-ordinates, reveals its most glaring defects (fig. 26). The Eurasian land mass covers 180° (instead of 130°), Scotland is at a right angle to England, lower Italy askew, the Sea of Azov exaggerated and too far north, the Caspian sea in a prone instead of upright position, the triangular shape of India not realized, Ceylon grossly exaggerated and the China coast, beyond the Malay peninsula, verging into Terra Australia and enclosing the Indian ocean. Despite its defects Ptolemy's work had canonical authority for 1,500 years. Maps in the "Ptolemaic style" continued to appear in atlases more than a century after Columbus and Magellan had disproved Ptolemy's conceptions, and some of his errors persisted on maps even in the 18th and 19th centuries.

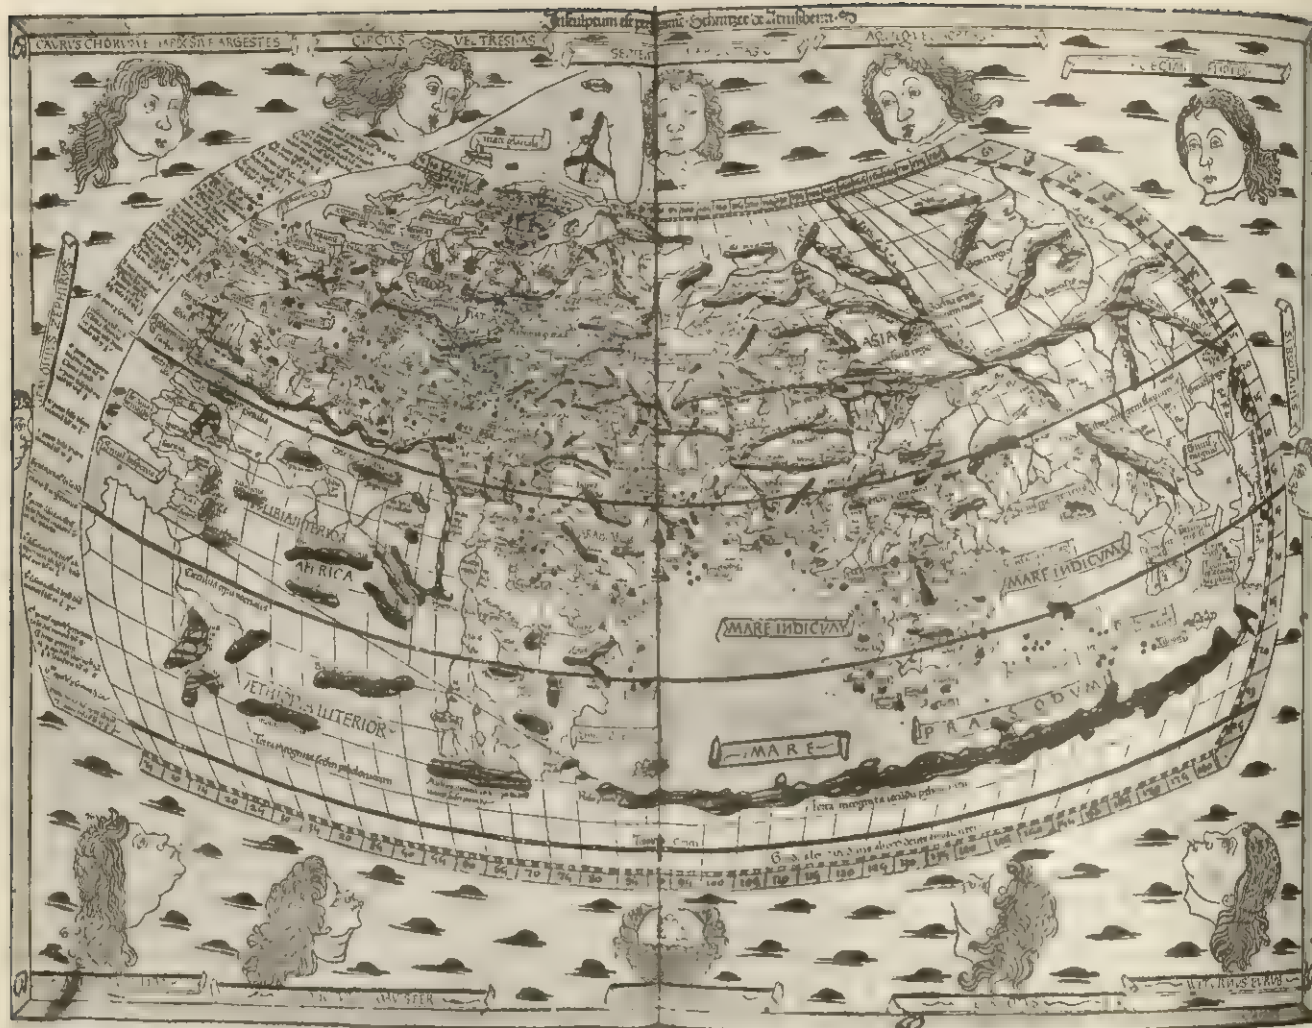

Solinus early in the 3rd century wrote a geographical book largely copied from Pliny and Mela. In order to make his book entertaining, he culled the more incredible statements from Pliny's *Natural History* and inserted them in his geographical account. The result was a fascinating book of wonders that did much to popularize in later ages the tales of monstrous creatures in Africa and India.

(W. H. S.)

C. MEDIEVAL EUROPE AND ORIENT

Three main sources were used by the makers of medieval maps: the classics, Scripture and its interpretation by the fathers of church, and the information provided by the world of Islam. To the writers of the classical schools of geography the medieval map maker was indebted for names of places, for statistical and historical information; to the Christian sources, for authority to support the framework of the map and for references to religious matters; to the Arabs, for topographic detail, and possibly for the knowledge of the magnetic compass. A fourth source was first-hand observation, the results of which are evident in many maps.

Little survives of the maps of the late Roman empire. Besides some fragments of surveyors' sketches, part of one unusual map escaped destruction, the mosaic map of Madaba (Ma'daba), which formed the floor of a Christian church in modern Jordan, southeast of the Dead sea. The fragments, found in the 1890s, show that it was a large map of the Holy Land, made during the first

BY COURTESY OF THE LIBRARY OF CONGRESS

half of the 6th century. Its outstanding feature is a plan, in the form of a bird's-eye view, of Jerusalem before the Arab conquest.

Pilgrims' guidebooks, some undoubtedly illustrated with crude maps, were popular as early as the 4th century A.D. The concern of theologians with an accurate interpretation of the world also led to the preparing of maps, the most famous and earliest of these being the world map of Cosmas (*q.v.*), a merchant of Alexandria turned Christian monk, who wrote his *Christian Topography* during the 6th century. Although only later copies of his world map survive, the book itself described the map in detail. It was a rectangular one, showing the world surrounded by the ocean sea, and surmounted by the heavens, the whole in the image of the tabernacle as described in the Bible. A later but equally primitive world map accompanied the commentaries written by Beatus, a Spanish monk, on the Revelation of St. John, during the 8th century. There are many variants of the Beatus world map, the earliest dating from the 10th century, all of them presenting a distorted, inaccurate view of the world.

1. "T and O" Maps.—The notion of the earth being round, though at times condemned by the church, never completely disappeared. Yet medieval maps, practically without exception, appear to show the earth as a flat disk. On this type of map, which often accompanied such church-approved encyclopaedias as that of Isidore of Seville (*q.v.*), the world is shown consisting of the three continents of Europe, Asia and Africa, with the top of the map being east, and the centre of the earth, in accordance with Scripture, at Jerusalem.

The threefold division of the world was best shown in the maps called "T and O" maps. These, popular throughout the medieval period, showed the world surrounded by a circular ocean, the

"O"; the three continents of Europe, Asia and Africa were divided by a perpendicular line, the stem of the "T," representing the Mediterranean, and a horizontal line, the top bar of the "T,"

BY COURTESY OF THE LIBRARY OF CONGRESS

FIG. 27.—MAP FROM ISIDORE OF SEVILLE'S ENCYCLOPAEDIA

consisting of the Nile, separating Africa and Asia, and the Dnieper, separating Asia and Europe.

The simple framework of the "T and O" map eventually came to be embellished by a wealth of detail, some real, some imaginary, taken from Pliny, from later Roman and from early medieval writers. While some of the originals of this type barely measured an inch across and fitted into the top of the letter "P," as an illuminated initial, others were as much as 60 in. wide. The two most famous of this latter type, both made during the 13th century, are the Hereford map, in England, and the Ebstorf map, in northwest Germany. There existed also simple map sketches which, in defiance of the denial that life could exist beyond the torrid zone around the equator, showed the world divided into five climates, following closely the classical Greek scheme.

2. Portolan Charts.—The maps of Britain by Matthew Paris, an English chronicler of the 13th century, are among the very few medieval maps that show a definite attempt to present an accurate image of a single country. It was not until the latter part of the 14th century that a successful attempt was made to include in a map of the world at least some of the recently acquired

FIG. 29.—PORTOLAN CHART OF THE EASTERN MEDITERRANEAN AREA (1311) BY PETRUS VESCONTE

Dalorto among them. All of these charts show the Mediterranean sea, the Black sea and parts of the Atlantic. There is evidence that they were used as early as 1270, and the general outline of the map itself, and much of the detail of the coast lines, did not change between 1300 and 1600. The portolan charts are more accurate than any medieval map. When the centre of chart making shifted from north Italy to the Balearic Islands and to Catalonia, much of the detail so well presented in these maps was incorporated in the Catalan map of 1375.

One of the important characteristics of all portolan charts is the network of lines radiating from several centres distributed all over the chart. These lines conform to the 8 or 16 principal parts of the compass rose, and they were probably used by seamen to lay out courses from port to port, in the manner used on modern navigation charts.

3. Mauro and Behaim.—The map makers' art of the middle ages culminated in the works of two men of the 15th century. Fra Mauro, a monk and cartographer of Venice, completed his world map in 1459. It shows the world in the shape of a wheel, and contains a wealth of accurate and important detail on Asia and Africa, taken from the intelligence accumulated during the previ-

FIG. 28.—THE HEREFORD MAP (13TH CENTURY)

knowledge of Africa and Asia. The Catalan map of the world of 1375, prepared for the king of France, was the work of a new and much improved technique of map making. The "T and O" and other medieval maps were schoolmen's maps, made to illustrate a preconceived and highly stylized view of the world. The Catalan map, on the other hand, derived much of its contents from portolan, or seamen's charts, which were drawn in as strictly factual a manner as the tools of the time allowed. While there is some doubt as to the originals of the portolan charts, there is agreement on certain points in their history. They were made possible by the extensive use of the magnetic compass; they conformed to a common, now lost, model in their outline, in their scale and in many minor details; and they were based, in part at least, on the pilot books or *periploi* of Greco-Roman origin.

The oldest portolan chart is the so-called Pisan chart, made around 1300. Its name is derived from the portolano, the pilot book that listed courses, anchorages and ports. Some 30 or so portolan charts made during the first half of the 14th century survive. All were drawn by Italians, of whom several are known by name, John of Carignano, Petrus Vesconte and Angelino

BY COURTESY OF THE LIBRARY OF CONGRESS

FIG. 30.—THE WESTERN HEMISPHERE ACCORDING TO MARTIN BEHAIM'S GLOBE (1492)

ous two centuries. Martin Behaim (*q.v.*), a German who served the court of Portugal as astronomer during the great age of Portuguese discoveries, prepared a globe, the oldest terrestrial globe extant, for his native city of Nürnberg in 1492. On it the western coast of Europe and the east coast of Asia face each other across the waters of the Atlantic, and there is no indication as yet of the new world, to be discovered within a few months by Columbus.

4. Islamic Maps.—Map making among the Muslims did not match the accomplishments of their European contemporaries. The mathematical and astronomical skill of the Muslims, and the fact that Muslims sailing the Indian ocean used maps that had much in common with the European portolan charts, was not reflected in the primitive sketches that illustrate Muslim works of geography. The only medieval Muslim map of note, known through later copies, is the famous map of Idrisi, prepared in Sicily at the court of the Norman kings during the 12th century. Idrisi's map was based, in part, on Ptolemy, following his scheme of climates, and its portrayal of the Mediterranean and of the near east was far superior to that of any European map of the time.

5. Far East.—Maps were well known in China, Japan and Korea during the middle ages, yet no original maps are known to have survived. There were prototypes, such as the Gyogu map of Japan, probably first prepared during the 9th century, and maps of China and of the world known to the Chinese were made during the first centuries of the Christian era. The maps drawn in the far east were as self-centred as were medieval maps, and the mythical element occupies fully as important a place on them, regarding Europe, western Asia and much of Africa, as it does on their European counterparts, regarding the far east. (G. K.H.)

D. EARLY MODERN PERIOD

1. Revival of Ptolemy.—By 1400 Greek manuscripts of Ptolemy's *Geography* had reached Italy, and its contents became known to western Europe in the Latin translation made by Jacobus Angelus in 1410, first in manuscript copies and from 1475 in printed editions. The world map and 26 regional maps derived from Ptolemy's text, drawn on a conical projection and graduated in latitude and longitude, were first printed at Bologna in 1477, from copperplates. The maps were redrawn in Florence, on a new trapezoidal projection, by the German monk Donis Nicolaus, whose maps were printed in the woodcut edition of Ulm (1482). The *Geography* was the first world atlas; it coloured geographical thought until the end of the 16th century, and 31 Latin or Italian editions with maps were printed before 1600.

"Modern" maps (*tabulae novae*) were early added to the Ptolemaic atlas, both in manuscripts and printed editions. The earliest was a map of the north drawn at Rome in 1427 by the Dane Claudius Claussøn Swart, known as Claudius Clavus. Cardinal Nicholas Krebs (1401–64), of Cusa (Cues, on the Moselle), drew the first modern map of Germany, which was engraved in 1491. By the beginning of the 16th century the hemispheric division of the world, into the "old world" of Ptolemy and the "new world" of the discoveries in the west, was becoming familiar. The enlargement and correction of Ptolemy's world map by new knowledge derived from exploration called for increasing numbers of maps. The Strasbourg edition of Ptolemy (1513) had no fewer than 20 modern maps by its editor Martin Waldseemüller; and the edition by Sebastian Münster printed at Basel in 1545 had 32.

2. Cartography of the Discoveries.—The great discoveries of the 15th and 16th centuries, both those to the east and those to the west by Columbus and John Cabot and their successors, were laid down on compass charts, or portolan charts (*see above*), of traditional type, developed from that of the Mediterranean area. Chart making flourished in the Italian ports, notably Genoa, Ancona and Venice; and it is on charts drawn in these centres that the Portuguese voyages along the coasts of Africa are recorded, since only one Portuguese chart made before 1500 has survived. The Casa da India at Lisbon had however from an early date been responsible for training pilots and cartographers, and Portuguese chart makers were held in high repute throughout the 16th century, although the Portuguese authorities sought to keep

their work secret. The Cantino world chart, which depicts the lands discovered in the east and west, was obtained surreptitiously in Lisbon in 1502 by Alberto Cantino, agent of Duke Ercole d'Este, of Ferrara. The leading Portuguese cartographers of the 16th century were Pedro Reinel and his son Jorge, Lope Homem and his son Diogo, Diogo Ribeiro, Fernão Vaz Dourado and Luís Teixeira. In Spain the Casa de la Contratación de las Indias, established at Seville in 1508, was charged with the supervision of charts and the maintenance of a master chart (*padrón general*); among its cosmographers were Nuño García de Torenó (who prepared the charts for Magellan's circumnavigation), Ribeiro (who spent his working life in Spanish service) and Alonso de Santa Cruz. Between 1540 and 1566 a number of manuscript world maps were drawn, largely from Portuguese sources, by hydrographers of Dieppe, notably Pierre Desceliers and Nicolas Desliens.

Columbus' belief that Cathay could be reached by sailing westward was no doubt inspired by the study of a globe. Like the (now lost) world chart which the Florentine Paolo Toscanelli appears to have sent Columbus in 1474, Martin Behaim's globe (*see above*) encouraged belief in the western route by ascribing a width of only 126° longitude to the ocean separating Europe from Asia. Juan de la Cosa, who sailed with Columbus in 1492–94, drew the earliest surviving world chart showing the discoveries in the new world by John Cabot, Columbus and the Spanish; this is dated 1500.

3. 16th-Century Chart.—The "plane chart," drawn from compass bearings and dead reckoning, with north-south lines parallel, had two serious defects for navigation. It did not represent the convergence of the meridians, and therefore falsified east-west distances in higher latitudes; and it did not allow for differences in magnetic variation. The first of these problems was to be solved only when Mercator's projection, employed in his world chart of 1569, came into use. The second was serious for navigation in American waters, where a large westerly variation was found; among the devices adopted to overcome it was the drawing of a second, "inclined" meridian, as on the chart of the North Atlantic by Pedro Reinel (*c.* 1504), to indicate local variation. Coastal charts, with "rutters" or sailing directions, were developed by northern seamen from the early 16th century. In the first printed sea atlas, the *Spiegel der zeevaerdt* (1584), by Lucas Janson Waghenaer of Enkhuizen, the chartwork already shows many modern characteristics, notably soundings and the profile representation of shore marks.

4. 16th-Century Cartographers.—The maps and globes of the 16th century, as an index of contemporary geographical knowledge, illustrate the gradual modification of the Ptolemaic world picture to admit new concepts derived from discovery—the outlines of Africa, India and southeast Asia as revealed by the Portuguese voyages; the unbroken extension of America from the Arctic circle to Magellan strait; the existence and longitudinal span of the Pacific ocean, disclosed by Magellan.

The principal centres of cartographic activity, outside the Iberian peninsula, were Italy, the Rhineland, the Netherlands, France, Germany and Switzerland. Martin Waldseemüller (1470?–1518?), who worked at St. Dié in the Vosges, produced two large woodcut world maps; that of 1507, the earliest to use the name America, was compiled from "the tradition of Ptolemy and the voyages of Amerigo Vespucci and others," while the *Carta marina* of 1516 was drawn in chart style. Waldseemüller's world view was popularized by other German cartographers, notably Johannes Schöner (1477–1547), who worked at Nürnberg and produced four globes between 1515 and 1533; Peter Apian (1495–1552) of Ingolstadt; Kaspar Vopel (1511–61) of Cologne; and Sebastian Münster (*q.v.*), who worked at Basel. The leading cartographer in France during the century was Oronce Finé (1494–1555) and in Italy Giacomo Gastaldi (*c.* 1500–65).

The Netherlands school of cartography stems from Gemma Frisius (1508–55) of Louvain, whose enlarged edition of Peter Apian's *Cosmographia*, with its world map, was frequently reprinted from 1533. Gemma applied himself to many geographical problems, including those of the longitude and the convergence of meridians. Among his pupils was Gerardus Mercator (*q.v.*; *see*

FIG. 31.—MERCATOR'S CHART OF THE WORLD (1569)

also *Map Projections*, above), who assisted in the preparation of Gemma's pair of engraved globes (1535 and 1537) and published his own globes in 1541 and 1551. Mercator, who worked at Louvain until 1552 and thereafter at Duisburg, became the leading cartographer of the age; his principal maps were those of Palestine (1537), the world (1538), Flanders (1540), Europe (1554 and 1572) and the British Isles (1564), besides his world chart of 1569 (see fig. 31), his Ptolemy edition and his *Atlas*.

By the last quarter of the 16th century the main European centre of map production had shifted from Italy to the Netherlands, and particularly to Antwerp, where Abraham Ortelius and Gerard de Jode published their atlases (see below). In the northern Netherlands cartography developed with overseas enterprise. Petrus Plancius (1552-1622), first cartographer to the Dutch East India company, had a copious output, including two large printed world maps (1592 and 1594). In England, Flemish cartographers and map engravers gave an impetus to the art; the first English globes, those of Emery Molyneux, were engraved by Jodocus Hondius in 1592. In 1599 Edward Wright explained the construction of Mercator's projection in mathematical terms, and a world chart on this projection, ascribed to Wright, accompanied Richard Hakluyt's *Principall Navigations* (1598).

5. Regional Cartography.—The regional maps of the middle ages had been drawn from route surveys or eye sketches, supplemented by linear measurement. During the 15th century local maps constructed from the road system were made in Italy; and a woodcut map by Erhard Etzlaub of Nürnberg, printed in 1500 with the title *Das ist der Romweg*, showed the roads of central Europe and Italy with mileages between towns.

In the first half of the 16th century geometrical methods of survey, with more precise instruments for observation of angles, were introduced by geographers of Germany and the Netherlands, and the principle of triangulation was described in 1528 by Münster and in 1533 by Gemma Frisius. This enabled a relatively large area to be surveyed more rapidly as well as more accurately and many countries or regions were first mapped during the century. Among such maps may be mentioned Finé's France (1525),

the maps of parts of Germany published by Münster from 1545, Prussia (1542) by H. Zell, maps of Switzerland by Konrad Türist, Johannes Stumpf and Aegidius von Tschudi between 1495 and 1538, the provinces of the Netherlands (1556-60) by Jacob van Deventer, Austria (1561) by Wolfgang von Lazius and Bavaria (1568) by Philip Apian. Scandinavia and the north were delineated by Olaus Magnus (1539); Russia and eastern Europe by Anton Wied (1542), Sigismund von Herberstein (1549) and Anthony Jenkinson (1562). The prototype for maps of Great Britain was that by "G. L. A." (George Lily) engraved at Rome in 1546. Many of these regional maps, including those of the British Isles by Humphrey Lhuyd (1527-68), were reproduced in Ortelius' *Theatrum* (see below). The first survey of the English counties was made by Christopher Saxton (c. 1542-1606); his county maps were engraved during 1574-79 and his large map of England and Wales in 1583. The earliest atlas of the French provinces was published by Maurice Bouguereau at Tours in 1594. Here too may be mentioned the popular collection of views or plans of cities, the *Civitates orbis terrarum* (1573-1618), by G. Braun and Frans Hogenberg.

6. Printed Maps and Atlases.—Although the maps in the Italian editions of Ptolemy of the 15th century had been printed from engraved copperplates, the woodcut was the dominant medium for map reproduction until nearly the middle of the 16th century. From about 1540 copperplate engraving established itself, first in Italy, as the fittest technique for map printing, and this process was to maintain its ascendancy for four centuries.

The prototype of the atlas was the collection of Ptolemaic maps, increasingly supplemented by "modern" maps. In 1528 Münster appealed to German geographers to survey their regions and send him their maps, many of which were included in his edition of Ptolemy (1540) and in the successive editions of his *Cosmographia* from 1545. In Italy there was a copious production of engraved sheet maps, and such map dealers as Antonio Laferri at Rome and G. F. Camocio and P. Forlani at Venice offered for sale sets of maps from their stock, covering the world and systematically arranged "in Ptolemy's order." The first modern atlas, however,

compiled on uniform principles laid down by its editor, is the *Theatrum orbis terrarum* published at Antwerp in 1570 by Abraham Ortelius (q.v.). Its 70 maps on 53 plates, mainly engraved by Frans Hogenberg, were compiled from the best sources available and reduced to a common size and style; and the *Theatrum* was enlarged and kept up to date in successive editions until the last in 1612. Its rival, the *Speculum orbis terrarum* of Gerard de Jode (1509-91), published at Antwerp in 1578, was less popular.

Mercator planned his *Atlas* (the first book of maps to which this name was given) as part of a great cosmographical project, earlier stages of which were represented by his world map (1569) and his edition of Ptolemy's maps (1578). The first two parts of the *Atlas*, engraved in his Duisburg workshop, appeared in 1585 and 1589; the third was published after his death by his son Rumold in 1595. In 1604 the plates were acquired from Rumold's heirs by the Amsterdam mapseller Jodocus Hondius.

7. 17th Century.—By 1600 Amsterdam had succeeded Antwerp as the centre of cartographic industry in the Netherlands, and the 17th century was the great age of Dutch map production. From the Amsterdam workshops of Jodocus Hondius (1563-1611), Willem Jansz Blaeu (1571-1638) and Jan Jansson (1596-1664), Frederik de Wit (fl. 1648-89) and other mapsellers, the European market was supplied with printed charts and sea atlases, globes, wall maps, town plans and views and, above all, atlas maps. Mercator's atlas was continually enlarged by Hondius and, after him, Jansson; Blaeu's first atlas, in two volumes, was published in 1635, and, like Jansson's, it had by 1660 expanded to 11 or 12 volumes. Blaeu became hydrographer to the East India company and the states-general, and his *Zee-spiegel* (1623) was the prototype of a long series of fine sea atlases by various map makers, notably Pieter Goos, J. A. Colom, A. Jacobsz and Hendrik Doncker. The earliest sea atlas drawn throughout on the Mercator projection was *L'Arcano del Mare*, compiled by Sir Robert Dudley and published at Florence in 1646. *Le Neptune françois ou atlas nouveau des cartes marines*, published at Paris in 1693, marked a further advance in hydrography; drawn on the Mercator projection, its charts laid down the positions of many places from "fixes" made by the French astronomers.

The most prolific and influential French cartographer of this period was Nicolas Sanson of Abbeville (1600-67), who established his Paris workshop about 1634 and published his first atlas in 1654. After his death his business was carried on, in turn, by his sons and by A. H. Jaillot (1640-1712); and his son-in-law Pierre Duval (1619-83) was also a productive cartographer. Their work foreshadowed the authority enjoyed by French cartography in the first half of the 18th century.

At the end of the century Johann Baptist Homann (1664-1724) of Nürnberg established a vigorous map business which continued into the next century. V. M. Coronelli (1650-1718), cartographer to the republic of Venice, produced many fine globes and maps, based on careful research.

In England, apart from the popular county atlas of John Speed, *The Theatre of the Empire of Great Britain* (1611-12), in which the maps were engraved by Hondius, map production languished until after 1660. The Restoration period saw a revival of activity; John Ogilby made the earliest survey of the English roads, published in his *Britannia* (1675), and the printing of charts began with the work of John Seller, John Thornton, Greenville Collins and others. In 1681-88 Collins first surveyed the coasts of Great Britain. Not until the 18th century, however, was English map production to overtake that of the Netherlands and France.

Reformation of Cartography.—During the 17th century few major new data were added to the world map by discovery, although these included the coast of Australia revealed by Dutch voyages, parts of the interior of North America explored by the French, and fuller knowledge of China contributed by Jesuit missionaries. Yet in this period the foundations of the modern map were laid by improvements in the technique of instrumental observation and survey, particularly the introduction of telescopic sights and the development of instruments for leveling and for

the precise measurement of horizontal and vertical angles. In 1671 the Paris observatory was established, and from this time the latitude and longitude of an ever-increasing number of points were fixed by instrumental observations under the auspices of the French Académie Royale des Sciences.

The framework of an accurate world map depends on determinations of the size and shape of the earth, derived from measurement of the length of a degree along a meridian. Arcs of a meridian had been measured in 1606 by Willibrord Snell, in Holland, and in 1635 by Richard Norwood, in England. The measurement was attempted by more scientific methods in France in 1669-70 by Jean Picard, whose measured arcs were extended between 1700 and 1718 by J. D. Cassini (1625-1712) and his son Jacques, the first two directors of the Paris observatory. The geodetic data thus obtained served as the basis for the redrawing of the world map by French cartographers of the early 18th century.

Special Maps.—During the 17th century some of the earliest experiments were made in the drawing of maps to represent the data of special sciences in their geographical relationship. Edmund Halley's chart of the trade winds (1686) is the first meteorological map; and maps of the ocean currents were published by Athanasius Kircher in 1665 and by E. W. Happel in 1675. Attempts to illustrate magnetic variation on maps had been made by C. Burrus in 1630 and by Kircher in 1643; but the first variation charts based on observation were those of Halley (the Atlantic, 1701; the world, 1702). In these Halley introduced the isopleth, or curve-line of equal value, which was long known as the "Halleyan line." (R. A. Sn.)

E. MODERN PERIOD

In 1700 nearly half of the earth's surface was still unexplored or little known. After World War II the initial reconnaissance mapping of the earth was brought to its close in the antarctic wastes. For millenniums this task, with the related riddle of what lay beyond the margins of the "known world," had confronted the cartographer with his most challenging problem. From the beginning of the 18th century a more difficult problem has replaced it—that of mapping the known world to meet the demands of a civilization that has come to use maps for purposes never before dreamed of.

1. Transportation, Travel and Maps.—Transportation and travel always have been powerful stimulants to mapping. In the modern period, mapping the world's coast lines has been pushed forward along traditional lines, and many maps of wholly new kinds have been made to help ships move from place to place—maps of the sea floor, ocean currents, winds, storm tracks, air and water temperatures and the like—the making of which has yielded great quantities of scientific data as by-products. In the sparsely

settled parts of Australia, Siberia, Latin America, western North America, and elsewhere, the first detailed reconnaissance mapping was often carried out as part of the search for routes for railways, and the precise leveling done in connection with the construction of railways, canals and highways supplied many of the data upon which the earliest hypsometric mapping was based. Successive improvements in travel by road gave rise to the post-route and stage-route maps of earlier times and to the modern motorists' maps. The airplane, like the ship, has occasioned world-wide programs of surveying and observation to procure air navigation charts and meteorological maps for air traffic guidance and protection; it also has facilitated the task of mapping for countless other purposes. The airplane brought these revolutionary changes in cartography within three decades.

2. War and Maps.—War is another stimulant of human mobility and hence of cartography. The campaigns of Alexander the Great and Genghis Khan opened vast and little-known tracts for subsequent mapping, but in modern times the influence upon mapping of preparations for war has been greater than that of military campaigns as such. The small, lightly equipped armies of pregunpowder ages had little need for maps; local guides showed the way, and arrows and spears could find their targets without the aid of cartography. The advent first of artillery and later of the

nation-in-arms changed the situation. The topographic mapping of modern Europe, which began in the 16th century and has been pursued comprehensively from the mid-18th century, was undertaken largely to facilitate the aiming of field guns, the finding of cover and the moving of large bodies of men and matériel. Napoleon was alert to the military value of topographic maps and did much for cartography.

World War II, coming as it did after aviation and photogrammetry had been well developed, far exceeded all previous wars in the extent of its effects upon map making. During its course immense areas, even in regions remote from the theatres of war, were flown over, photographed and mapped on the chance that the maps might be needed; and totally unprecedented in magnitude was the work of making new and reproducing old maps to show not only routes and targets of concern to the planners of military operations but also a variety of special matters of possible value to those directing the political, economic and psychological phases of the war. During World War II two agencies of the United States armed forces are said to have printed about 650,000,000 copies of some 50,000 different maps.

3. Governmental Mapping.—As long as maps were used for relatively few socially indispensable purposes, cartography was left mostly in private hands. As the essential uses of maps have multi-

FIG. 33.—PART OF ERZ MOUNTAINS SOUTHEAST OF DRESDEN AS SHOWN ON JOHANN CHRISTOPH MÜLLER'S MAP OF BOHEMIA (1714-20), AN EARLY TOPOGRAPHICAL MAP ON WHICH RELIEF IS STILL REPRESENTED AS ON MEDIEVAL MAPS

plied, however, certain basic cartographical enterprises, such as police, postal, water supply and other indispensable services, have been taken over by governments. At first these enterprises consisted mostly in the production of topographic maps and marine charts, but they have been extended to the mapping of minerals, soils, geological formations, climate, vegetation, land use and much else. Before the 19th century in most countries and until well into it in some, topographical mapping was based upon occasional surveys, and the maps were usually known by the names of the surveyors or engineers in charge (e.g., the Cassini map of France, 1750-93; the Rizzi Zannoni map of Poland, 1772; the Dufour map of Switzerland, 1842-72). Eventually, however, the work was taken over on a continuing basis by great technical organizations such as the Ordnance survey of Great Britain (founded 1791), the Service Géographique de l'Armée in France (replaced in 1940 by the Institut Géographique National) and the Federal Topographic bureau of the Swiss general staff. Most of these, at least in Europe, have been set up by the armed forces or their responsible ministries. In the United States and Canada, by contrast, the principal governmental mapping agencies (e.g., the U.S. coast and geodetic survey, founded as the U.S. coast survey in 1807; and the U.S. geological survey, founded in 1879) have been under civilian administration, a result in part, no doubt, of the freedom from fear of invasion that the geographical isolation of North America fostered until as late as World War II. During and after World War II the armed forces in the United States and Canada greatly enlarged the scope of their cartographical work.

4. Influence of Science and Technology.—The development of cartography during the modern period also has been affected profoundly by the general advancement of science and technology, and in particular by adaptations that have been made, one after another, of certain instruments and techniques to the uses of surveyors and cartographers. Foremost among these, in so far as the basic mapping of the visible features of the earth's surface is concerned, were the telescope in the 18th century and the camera in the 20th.

During the 200 years following its invention (about 1608), the telescope (q.v.) was increasingly put to use in the making of astronomical observations to determine geographical positions. It was also introduced into surveying and navigational instruments as an integral part of their structure, thus greatly enhancing their precision. By the mid-18th century, the telescope had had two important effects upon cartography: it had made possible the accurate construction of modern map projections (as, e.g., in the work of J. H. Lambert) and it had helped furnish a quantity of astronomically and trigonometrically determined control points for topographic maps, marine charts and reference maps in general. Thus, largely by means of the telescope were obtained many of the new data upon which Guillaume Delisle, J. B. d'Anville and others based the extensive revision of earlier maps that has been called the cartographic reformation of the 18th century. Since this movement was mainly directed toward the correction of errors, it was, indeed, a reformation rather than a revolution. It led, however, to genuinely revolutionary changes toward the close of the century. Max Eckert, the German cartographer, writing in 1921, maintained that since the Renaissance no greater change had taken place in the general appearance, accuracy and construction of maps than that which differentiated the maps of the 19th century from their predecessors.

The years after Eckert expressed this view, however, saw a second and even more radical cartographical revolution, in which the camera played a part comparable to that of the telescope in the earlier reformation. Carried aloft in airplanes, the aerial camera advanced the mapping of the visible face of the earth at a speed and with a fullness of detail never before remotely approached and disclosed for mapping much that had remained invisible to earthbound observers (e.g., facts of archaeological or botanical interest). Also, in the rooms where maps are actually produced, special cameras have effected hardly less spectacular improvements in the processes of compilation, drafting and reproduction. The application of photography to mapping gave birth

to that new handmaiden of cartography and surveying, photogrammetry, with a whole repertory of techniques and a battery of instruments of its own. During and after World War II, moreover, the cartographic revolution entered a second stage in which for many operations, the use of electronic devices came to supplement or supersede the older optical and photographic techniques. (See also PHOTOGAMMETRY.)

Another development of the modern period is maps that show, by means of isolines or other symbols standing for specified quantities, the distribution of variables such as elevations, depths, temperatures, population densities, differences in wealth, etc. Such quantitative maps, now in universal use, were almost totally unknown before 1700. Edmund Halley's isogonic (compass-declination) map of certain oceans (1702), though not the very first of its kind, is the first known upon which isolines were used with fair success to show quantitative differences over large areas, and it inspired Alexander Humboldt many years later to propose that temperatures might be similarly shown by means of isotherms (1817). About 1730 Samuel Cruquius made the first recorded use of contour lines, when he employed them (not altogether correctly) to represent the depths of certain estuaries and rivers of the Netherlands coast, but contours were seldom used in the representation of land relief until the mid-19th century. While the barometer, thermometer and hygrometer were all greatly improved during the 18th century, they, too, were but little applied in hypsometric or meteorological mapping until the mid-19th century, for not until then had comparable data sufficiently numerous for cartographic purposes been assembled with their aid. Later a profusion of mechanical, optical, photographic, acoustical and electronic instruments for measuring conditions and forces in the depths of ocean, atmosphere and solid earth brought about an immense efflorescence of quantitative maps as tools of research and exposition in the various earth sciences (notably geophysics, geology and their allied fields of geomagnetism, meteorology, physical oceanography, geomorphology).

In many branches of the study of man and his affairs, historians, anthropologists, economists, sociologists, demographers and others also have come to depend, though to a lesser degree, upon quantitative maps based upon censuses and similar statistical inventories that likewise were unknown before 1700 and little used before the second half of the 19th century. Although such censuses are mentioned in the Bible, nobody seems to have thought of mapping the results until the early 19th century, when modern national census bureaus and the like had begun to gather large quantities of data for extensive areas. Notable pioneers in the advancement of statistical mapping were a British engineer, Henry Drury Harness (1804-83), whose population and traffic maps of Ireland appeared in 1837, and a German geographer, August Heinrich Petermann (1822-78), founder of the well-known geographical and cartographic journal *Dr. A. Petermanns Mitteilungen* (1855).

5. Outstanding Characteristics of Modern Cartography.—As a result of these various influences, cartography during the modern period differs essentially from the cartography of all earlier periods by reason of the great gains that have been made in the diversity, accuracy and quantity of maps produced.

Before 1700 the facts presented on maps were restricted mostly to the salient, visible features of the earth's surface—bodies of water, mountains, towns, roads, forests—and to such portrayals of human beings, animals, monsters and curiosities as the draftsman saw fit to add in the blank spaces. Since most modern maps have been designed to serve utilitarian, educational or scientific purposes, few carry the pictorial embellishment that added charm to the maps of earlier times. In this respect the 18th century was transitional: although 18th-century maps were somewhat more austere and accurate than those of the 17th century, a good deal of pictorial decoration was retained. By the 19th century it was almost wholly gone and today is found only on maps made in imitation of medieval and Renaissance models; indeed, all too many modern maps are in fact ugly. Nevertheless, it always has been understood that cartography can be not only accurate but also pleasing to the eye, and exquisite maps have been produced during the modern period, more, perhaps, in continental Europe

than elsewhere. The artistry that the early cartographers lavished on embellishment has been largely replaced by ingenuity in the finding of new types of phenomena to map and new symbols with which to map them.

Every map obviously presents a definite, if not readily measurable, amount of information. If it were possible to measure the total amount of information concerning any area presented by all maps that cover it, and then divide this figure by the area's extent in square miles or similar units, a figure would result that might be called the "map-area ratio" of the area. Could maps be made showing the values of this ratio, they would disclose at a glance how relatively well mapped (or, at least, thoroughly mapped) different areas are or have been (as is now suggested by coverage maps, but only with respect to maps of specific types; e.g., large-scale topographic maps, coast charts). World maps of map-area ratios for different dates during the modern period would show patterns conforming broadly with densities of population, but with the highest ratios and the greatest gains in areas where economic and educational levels have stood highest and risen most. Throughout the period by far the most numerous and extensive tracts of very well-mapped territory have doubtless lain in western Europe (including Germany), where topographic mapping to large scales has been supplemented by the intensive special mapping of a multitude of natural and cultural circumstances, past and present. Where such cartographical treasures have been accumulated, they have frequently, though not invariably, inspired the publication of national or regional atlases (see *ATLAS*).

Correlation between population and map-area ratios of course is not perfect; certain uninhabited or sparsely settled areas—such as frontier zones of strategic importance (e.g., northeastern France), strips of wilderness along international boundary lines (e.g., Alaska-Canada), submarginal farming areas under paternalistic governments, undeveloped areas that attract tourists or present problems of special scientific interest, and, especially, areas believed or known to contain valuable natural resources—have been well mapped. Conversely, certain areas have been less well mapped than the comparative prosperity and enlightenment of their inhabitants might suggest; this has been true of large parts of the United States, and perhaps also of the country as a whole.

The number of maps that the people of a village or city or nation own or make or use per capita could be called a map-population ratio. Such ratios, like map-area ratios, though not readily determined as actual figures, are useful as concepts, in that they suggest realms of investigation that have been neglected by historians of cartography, most of whose work has dealt with individual maps and cartographers rather than with the larger historical bearing of the subject.

Map-population ratios would signify varying degrees of "map-mindedness," "map-dependence," and the like, and would also be found to correspond roughly with differing economic and educational levels. In their map-population ratios, France, Germany, the Netherlands and Great Britain must have led the world by a wide margin in 1700, and, along with the United States, Canada and the other more fully industrialized countries, are doubtless still in the lead. Here again, the ratios have probably stood higher in western European countries and lower in the United States than the respective relative levels of prosperity and education might lead one to expect. While it cannot be stated categorically that western European peoples make and use more maps per capita than Americans or Russians do, western European pre-eminence throughout the modern period in the production and use of maps for educational, scientific and scholarly purposes can hardly be questioned. This superiority is due, in part at least, to the high standards that have been set and consistently maintained by the great governmental cartographic establishments and certain of the geographical societies and geographical departments in the universities of western Europe, and also by such renowned old map-publishing houses as Justus Perthes in Gotha (name changed to Veb Hermann Haack Geographisch-Kartographische Anstalt in 1954), Bartholomew in Edinburgh and Hachette in Paris. Throughout the 19th century and until the eve of World War II

BY COURTESY OF THE LIBRARY OF CONGRESS

FIG. 34.—TOPOGRAPHIC MAP OF HARPERS FERRY, W.VA., ALSO SHOWING PART OF VIRGINIA AND MARYLAND (1953)

Germany produced the best general reference atlases, but after that the lead passed to the U.S.S.R. American standards in atlas and school-map production rose after the 1920s.

Other articles related to maps and mapping are referred to in the article *GEOGRAPHY (ARTICLES ON)*. See *ATLAS*; *CHART*; *GEODESY*; *NAVIGATION*; *PHOTOGRAMMETRY*; *SURVEYING*; etc. See also references under "Map" in the Index.

(J. K. W.)

BIBLIOGRAPHY.—*Techniques*: Few books in English deal comprehensively with modern techniques of map compilation, drafting and reproduction or with map design. The authoritative literature on the subject is mostly scattered in the technical publications issued by various government mapping agencies and in periodicals such as the *Geographical Journal* (Royal Geographical Society, London), the *Geographical Review* (American Geographical Society, New York), *Surveying and Mapping* (American Congress on Surveying and Mapping, Washington, D.C.), *Cartography* (the Australian Institute of Cartographers, Melbourne, Austr.). Most of the following books include extensive or specialized bibliographies and references: Arthur R. Hinks, *Map Projections* (1912; 2nd ed., 1921), *Maps and Survey*, 4th ed. (1942); H. S. L. Winterbotham, *A Key to Maps* (1936); Irving Fisher and O. M. Miller, *World Maps and Globes* (1944); Charles H. Deitz and Oscar S. Adams, *Elements of Map Projections*, 5th ed., Special Publication No. 68, U.S. Coast and Geodetic Survey (1945); W. Chamberlain, *The Round Earth on Flat Paper* (1947); Erwin Raisz, *General Cartography* (1938); T. W. Birch, *Maps, Topographical and Statistical* (1949); Arthur N. Strahler, *Physical Geography* (1951); Arthur H. Robinson, *The Look of Maps* (1952), *Elements of Cartography* (1953); J. A. Steers, *An Introduction to the Study of Map Projections*, 8th ed. (1950); M. Auroseau, *The Rendering of Geographical Names* (1957); Eduard Imhof, *Gelände und Karte* (1950); François Reignier, *Les Systèmes de projection*, 2 vol. (1957).

(O. M. M.)

History: G. R. Crone, *Maps and Their Makers* (1953) and the first four chapters of Erwin Raisz, *General Cartography* (1938), give concise, well-balanced general accounts of the history of cartography. Raisz's chronological charts are useful for quick reference, and his fourth chapter deals with American cartography. More elaborate are Leo Bagrow, *Die Geschichte der Kartographie* (1951), which deals with the development of mapping, especially as an art and craft, until the mid-18th century; R. V. Tooley, *Maps and Map-makers* (1949), essentially an annotated catalogue of maps dating mostly from the period 1475–1877; R. A. Skelton, *Decorative Printed Maps of the 15th to 18th Centuries* (1952) and *Explorers' Maps* (1958). Max Eckert's monumental *Die Kartenwissenschaft* . . . , 2 vol. (1921, 1925), is a store-

house of detailed information concerning the history of cartography arranged according to categories of maps.

All these works include bibliographical references. *Imago Mundi: A Periodical Review of Early Cartography* (1935-) contains articles and book reviews. For further bibliographical guidance see W. W. Ristow and Clara E. LeGear, *A Guide to Historical Cartography* (1954), the general cartographical periodical *Surveying and Mapping* (1941-), and current bibliography, *Bibliographie cartographique internationale* (1949-), as well as geographical periodicals and bibliographies, a fundamental source of data, since the history of cartography is inextricably interwoven with that of geography (see J. K. Wright and E. T. Platt, *Aids to Geographical Research*, 2nd rev. ed. (1947)).

The history of cartography was in general neglected until the mid-19th century, when the first great collections of reproductions of early maps were published (M. F. de Santarem, *Atlas composé de mappemondes, de portulans... depuis le VI^e jusqu'au XVII^e siècle, 1842-53*; E. F. Jomard, *Les monuments de la géographie... 1842-62*). These paved the way for a succession of similar works, of which four may be cited as representative examples, covering broad subjects with great erudition: A. E. Nordenskiöld, *Facsimile Atlas to the Early History of Cartography* (1889), *Periplus: An Essay on the Early History of Charts and Sailing Directions* (1897); Konrad Miller, *Mappaemundi: Die ältesten Weltkarten*, 6 vol. (1895-98), *Mappae arabicae*, 6 vol. (1926-31). Growing interest in the history of the geographical discovery, exploration and early surveying and mapping of particular parts of the world, especially the Americas but also notably Africa, central and northern Asia and the Pacific, inspired the publication of similar collections, together with commentaries and pertinent monographs and periodical articles (partially listed by Bagrow, *op. cit.*, pp. 378-383).

The 19th and 20th centuries have been given comparatively little attention in the study of the history of cartography. The characteristic plainness or austerity of most modern maps, together with their superabundance and the many complexities that are involved in studying them, have made them less appealing to scholars and collectors than the maps of earlier times have been. Three publications bearing on cartography in the modern period may be cited as representative: G. M. Wheeler, *Facts Concerning the Origin, Organization, Administration, Functions, History, and Progress, of the Principal Government Land and Marine Surveys of the World* (1885); Walter Thiele, *Official Map Publications* (1938); W. W. Ristow, *Aviation Cartography: A Historico-Bibliographic Study of Aeronautical Charts* (1956).

(J. K. W.)

MAPLE, the name of more than 150 species of trees and shrubs belonging to the genus *Acer* of the family Aceraceae (q.v.). Two unrelated species, *Flindersia brayleyana* and *Cryptocarya obata*, are productive of timber known as Queensland maple and Macquarie maple, respectively.

Maples feature opposite, deciduous (rarely persistent), mostly palmately lobed leaves. Their small (but en masse often showy) red, orange or greenish flowers appear before, with, or after leaf emergence. The two-winged samaralike fruits, sometimes referred to as keys, are also diagnostic. Several species are noted for their excellent timber; others are better known because of their ornamental use.

The North American flora includes the 13 native maples listed here and several introduced kinds. Big-leaf maple (*A. macrophyllum*), the only commercial western species, is the second most important hardwood in the Pacific northwest. Ranging from Alaska to southern California, it often attains a height of 100 ft. The wood is used for furniture and flooring; large burls occasionally found on old trees are sliced into fancy face veneers for decorative panels. A small, often prostrate or vinelike, understory tree, vine maple (*A. circinatum*) is the only other maple indigenous to the areas bordering the Pacific.

Box elder or ash-leaf maple (*A. negundo*), a small transcontinental tree that occurs sparingly in nearly every state, features three- to seven-pinnately compound leaves, a characteristic rare among maples. Big-tooth maple (*A. grandidentatum*) and Rocky Mountain maple (*A. glabrum*) are small, little known trees of the Rocky mountain region.

Eight eastern species are divided into the hard, soft and mountain maple groups. Hard maples include the sugar (*A. saccharum*), black (*A. nigrum*), Florida (*A. barbatum*) and chalk (*A. leucoderme*) maples. The latter two species are small southern trees of little commercial value. Sugar maple, an important timber and shade tree, and with black maple the principal source of maple sirup (q.v.), extends from Newfoundland to North Dakota and south to Georgia and Texas. Often 90 ft. tall, its hard, pinkish-white wood is fabricated into furniture, flooring,

musical instruments, sporting goods and a host of other commodities. Timber with wavy or curly grain or bird's-eye figure is prized for cabinetry. Black maple, restricted to the northeast and lake states, produces timber of comparable quality.

The soft maples, red (*A. rubrum*) and silver (*A. saccharinum*), are medium-sized trees of wide distribution east of the Great Plains. The former, the leaves of which are silvery white below,

ROCKE
LEAVES AND SEEDS OF THE RED
MAPLE (ACER RUBRUM)

grows very rapidly and is used as a street and shade tree. There are few trees more resplendent in flamboyant crimson autumn foliage than the red maple. While the wood of neither species is the mechanical equal of the hard maples, both are similarly used.

Striped maple or moosewood (*A. pennsylvanicum*), featuring smooth greenish bark striped with white, and the shrubby mountain maple (*A. spicatum*), are two understory species of northern forests. Hedge maple (*A. campestre*), of northern Europe and western Asia, is the only maple indigenous to Great Britain. Seldom exceeding a height of 20 ft., it is easily identified by its small leaves with rounded lobes.

The handsome sycamore maple (*A. pseudoplatanus*), an important timber tree of central Europe and western Asia, is a commonly used ornamental in the United States and Great Britain, as is also the Norway maple (*A. platanoides*), a lofty European and Asiatic timber tree. A variety, the Schwedler maple (var. *schwedleri*) with greenish-red to reddish-bronze leaves, is a widely planted ornamental.

Among the Asiatic species especially well suited for decorative and ornamental use, both in Europe and North America, are the small Chinese maple (*A. truncatum*), featuring deeply lobed, purplish-green leaves with truncate bases; dwarf or Siberian maple (*A. ginnala*), a compact shrub with three-lobed leaves; Japanese maple (*A. palmatum*) and its many varieties, featuring deeply dissected reddish to purplish foliage; and the hornbeam maple (*A. carpinifolium*), with unlobed foliage similar to the hornbeams.

See also references under "Maple" in the Index. (E. S. Hx.)

MAPLE SIRUP is one of the few crops produced solely in North America and is one of the oldest, having been produced by Indians of the Great Lakes and St. Lawrence river regions prior to the arrival of white settlers. Maple sirup is obtained mostly from the "sap" (sweet water) of the sugar maple (*Acer saccharum*) but some is obtained from the black maple (*A. nigrum*). It is produced in commercial quantities in the United States in Vermont, New York, Pennsylvania, Michigan, Ohio, New Hampshire, Wisconsin, Massachusetts, Maine, Maryland, Minnesota and West Virginia, and in Canada in Quebec and Ontario, ranked in order of production. The same type and quality of maple products are produced throughout the area. Differences merely reflect idiosyncrasies of producers and equipment.

The production of maple sirup is subject to yearly climatic and economic fluctuations. A record crop was produced in 1860 and a very small crop in 1959. The sweet water "sap" of the maple tree from which sirup is made is different from the circulatory sap of the growing tree. When the tree is dormant the sap will flow from any wound, such as a tap hole, in the sapwood each time a period of freezing is followed by a period of thawing. The sap contains 1½% to 3% solids, mostly sucrose. It does not contain either the colour or the flavour of maple sirup. These are imparted to it as the sap is concentrated by evaporation in open

pans to 65.5° Brix. Thirty to fifty gallons of sap are required to yield one gallon of sirup.

The usual maple sirup season begins in mid-January in the more southern states and ends in mid-April in the northern states, lasting four to six weeks in each place. Until the late 1940s the method of making maple sirup had remained almost unchanged over the more than 300 years of its history, with the exception of the development of the flue evaporator. During the next 10 years modernization began. The equipment for drilling tap holes was mechanized, sanitary methods of sap handling effected, precision instruments for sirup making developed, plastic tubing adapted for the transportation of sap from the tap holes of entire sugar bushes to storage tanks, and central evaporator plants established which serve whole communities of sap producers. These modernized methods improved and standardized maple products. The major products of maple sap are pure and blended table sirups, confections (cream, hard and soft candies), toppings for ice cream, flavourings and casing for cigarette tobaccos. (C. O. W.)

MAPLEWOOD: see SAINT LOUIS (Mo.).

MAQDISI (MUQADDASI), AL- (MOHAMMED IBN AHMAD AL-MAQDISI; i.e., "the Jerusalemite") (c. 946–c. 1000), Arab traveler and geographer, author of a noted work in Arabic on the lands of Islam entitled in one manuscript *Kitab al-Aqalim* ("The Book of Countries"), though another manuscript has a longer title. This work, published in 1985 and based mainly on his personal observations during 20 years of travel (in the course of which he visited all the Muslim lands except Spain, Seistan and Sind), is a mine of detailed information on the populations, manners and economic life of these lands in the 10th century.

See *Bibliotheca Geographorum arabicorum*, ed. by M. J. de Goeje, vol. iii (1877; rev. 1906). See also introduction to vol. iv of the same work for a discussion by M. J. de Goeje of al-Muqaddasi and his work. (H. A. R. G.)

MAR, EARLS OF. The Scottish earls of Mar emerge during the 12th century as successors of the Pictish rulers of Mar, one of the ancient provincial kingdoms of Scotland (comprising part of modern Aberdeenshire). The first earls were shadowy figures whose existence is known chiefly from their witnessing charters. Donald McEnhim was Mormaer of Mar by 1014 and the position apparently came to him through a female line since he was "of the race" of clan Leod. Earl GRATNEY (fl. c. 1300) married Christian, sister of Robert I, the Bruce, and their son DONALD (d. 1332) was a supporter of Edward II of England and was regent of Scotland shortly before he was slain at the battle of Dupplin on Aug. 12, 1332. His daughter MARGARET (d. c. 1393) brought the earldom to her husband, Sir William (later Earl of Douglas, and on the succession of their daughter ISABELLA (c. 1360–1408) troubles followed. While she was living at Kildrummy castle it was stormed by SIR ALEXANDER STEWART, to whom she was ultimately married and to whom (under duress) she granted the earldom in 1404. His claim to the earldom was confirmed by the crown in 1405 and (in a new grant) by James I in 1426, whereafter, as part of James's policy, it was deemed to have lapsed. It was annexed to the crown in 1435 and became the subject of rival claims until 1565. During this period the Erskine family made repeated claims on the lands and title of the earldom. Sir Robert Erskine (d. c. 1451), who became Lord Erskine in 1438, was styling himself earl of Mar by 1439. When, therefore, JOHN ERSKINE (d. 1572; see MAR, JOHN ERSKINE, 1st earl of), was made earl of Mar in 1565, there was much subsequent doubt whether this was a creation or a restoration, and it appears that (looking to the long disputes) he was invested in both the ancient and a new dignity. His successor JOHN (c. 1558–1634; see MAR, JOHN ERSKINE, 2nd earl of), 2nd earl, was a prominent politician. The title was forfeit when JOHN (1675–1732; see MAR, JOHN ERSKINE, 6th earl of), 6th earl, was attainted in 1716. The title was restored in 1824 for his grandson, JOHN (1741–1825), who became 7th earl of this line. His grandson, JOHN FRANCIS MILLER (1795–1866), 9th earl, also inherited the earldom of Kellie in 1835 and at his death in 1866 the Mar title was again subject to rival claims.

The earldom of Kellie and barony of Erskine descended to the

9th earl's cousin and heir-male, WALTER CONINGSBY (d. 1872), whose son, WALTER (1839–88), 13th earl of Kellie, had his claim to be 11th earl of Mar (enumerated from the 1565 creation) upheld by the house of lords in 1875. The title was also contested by the 9th earl's nephew and heir-general, JOHN FRANCIS ERSKINE GOODEVE (1836–1930), who assumed the additional surname of Erskine and who was confirmed as earl of Mar (enumerated as 27th from the ancient earls of Mar) by a statute in 1885.

JOHN FRANCIS HERVEY ERSKINE (1921–) succeeded in 1955 as 13th earl of Mar and 15th earl of Kellie, while JAMES CLIFTON OF MAR (1914–), 30th earl of Mar, succeeded to the ancient title in 1965. (T. I.)

MAR, JOHN ERSKINE, 1ST EARL OF (d. 1572), regent of Scotland, was a son of John, 5th Lord Erskine, who was guardian of James V, and afterward of Mary Stuart. Erskine at various periods held the keeperships of Edinburgh and Stirling castles, which were semihereditary offices in his family. During the struggle between the regent, Mary of Lorraine, and the lords of the Congregation, he acted consistently in the interests of peace; and in the religious disputes of the time he was a moderate member of the reforming party. When Mary Stuart returned to Scotland in 1561, he was made a privy councillor and favoured her marriage to Lord Darnley. Erskine was granted the earldom of Mar in 1565, thus substantiating the claims of his ancestors. With his wife, Annabella Murray, he acted as guardian of the young prince James, later James VI, who lived much of the time at Stirling castle. Mar prevented the prince from falling into the hands of the earl of Bothwell, and was a leader of the group of nobles who rose against Mary and Bothwell in 1567. He took part in the government during Mary's imprisonment at Lochleven and also after her abdication. He was chosen regent of Scotland in 1571 but his regency was not notably active and he was overshadowed by the earl of Morton. He was respected throughout his life as a man of principle, tending to follow a middle way in politics. Mar died at Stirling on Oct. 29, 1572. (Gr. G. S.)

MAR, JOHN ERSKINE, 2ND EARL OF (c. 1558–1634), Scottish politician and friend of James VI, was the only son of John, 1st earl, and was brought up at Stirling castle with the young James VI whose guardian he later became. Mar was concerned in the seizure of James VI at the "raid of Ruthven" (1582) and had to flee to England where he had the support of Elizabeth I, while the earl of Arran dominated Scottish politics. He was restored to favour in 1585 after marching on Stirling castle. He remained on terms of personal friendship with the king who in 1594 entrusted his eldest son, Prince Henry, to the guardianship of Mar and the dowager countess of Mar. In 1601 the earl was sent as envoy to London and conducted a mission which resulted in Elizabeth's assurance that James should be her successor.

After James's accession to the English throne in 1603, Mar was made a privy councillor and was one of the channels whereby James governed Scotland, as he said, by the pen. Mar was a member of the Scottish court of high commission and was treasurer of Scotland from 1616 to 1630, displaying energy in administering the country's scanty financial resources. He was also involved in many legal actions to recover his family heritage, lost when doubts existed about the state of the earldom of Mar (see MAR, EARLS OF). Mar died at Stirling on Dec. 14, 1634. (Gr. G. S.)

MAR, JOHN ERSKINE, 6TH EARL OF (1675–1732), foremost Scottish Jacobite leader in the 1715 rebellion, was the eldest son of Charles (1650–89), 5th earl. Initially a supporter of William III, he was secretary of state for Scotland and keeper of the signet under Queen Anne, playing a large part in the management of Scotland. He helped to carry the Act of Union of 1707, although he was so disappointed by its results that in 1713 he supported a motion for its repeal. Throughout, however, Mar's principal consideration was personal gain and because of his inconsistency he was known as "Bobbing John." It was dismissal from office on George I's accession in 1714 that gave birth to Mar's Jacobitism. In Aug. 1715 he secretly traveled to Scotland, and on Aug. 27 he held a hunting party at his seat at Aboyne where the plans for a rising were discussed. The government had neglected security arrangements in Scotland and Mar and his new associates

started with great initial advantages. Shortly after proclaiming King James at Braemar on Sept. 6, Mar had a force composed of Highlanders and northeast lowland Episcopalians which outnumbered the small government army of 1,500 in Scotland. These advantages were thrown away by Mar's ineptitude. He occupied Perth on Sept. 28, but wasted time when he ought to have crossed the Forth river immediately, to join up with the lowland Jacobites under Lord Kenmore (*q.v.*). John Campbell, 2nd duke of Argyll, who commanded for the government in Scotland, was a soldier of genius. He occupied the key point, Stirling, and refused to be drawn from it. Mar showed no initiative and when he did finally make an effort to get south of the Forth it was only to be checked by Argyll's inferior force at Sheriffmuir (Nov. 13). In spite of the belated presence of the Pretender the rebellion thereafter collapsed and in Feb. 1716 Mar fled with James to France. He was high in the Pretender's councils for some years and was in 1722 confirmed by him as titular duke of Mar. But the inveterate treachery of Mar's character cost him the favour of James and from 1725 until his death at Aix-la-Chapelle in May 1732, Mar had no connection with the exiled court.

Mar was attainted and his estate and title forfeited in 1716. Parts of the estate were salvaged by his family but the title was not restored until 1824; thereafter it was the subject of much dispute concerning its destination.

BIBLIOGRAPHY.—R. Patten, *History of the Late Rebellion* (1717); P. Hume Brown, *History of Scotland*, vol. iii (1909); A. and H. Taylor, *1715: the Story of the Rising* (1936). (W. Fz.)

MAR, SERRA DO, the name given to the Great Escarpment on the eastern margin of the Brazilian highlands. The escarpment extends all the way from Rio Grande do Sul to southern Bahia, but it is known as the Serra do Mar only in the middle section in Rio de Janeiro and São Paulo. Because of its name ("mountains of the sea") many map makers show this as a range of mountains rather than an escarpment on the edge of a plateau. The escarpment stands between 2,600 and 3,000 ft. above sea level at its top, but in Rio de Janeiro state it is surmounted by the Serra dos Orgãos (7,365 ft.) which overlooks Guanabara bay at Rio de Janeiro. The escarpment was originally covered with a dense rain forest. (P. E. J.)

MARABOUT (for classical Arabic *murabit*), originally, in the Maghreb (north Africa), a member of a religious community living in a *ribat* (a fortified Muslim monastery), an institution both religious and military. The building of a *ribat* was a state concern and service in it came within the scope of *jihād* (holy war). In the early days of Islam in the Maghreb, the marabouts, particularly at the *ribats* of Monastir and Sousse (both in modern Tunisia), performed a dual function, part defensive and part cultural. Men who possessed certain religious qualifications (such as reciters of the Koran, transmitters of the traditions of the Prophet's sayings and life, jurists of Islamic law and ascetics) lived in the *ribat* and were held in honour by the common people. When in the 12th century Islam spread to west Africa, its propagators became known as *al-murabitun* ("the people of the *ribat*," Almoravids; *q.v.*). From that day every missionary who organized a group of disciples became known as a *murabit*, the word coming more and more to denote "guidance" and losing its connotation of military defense. In the 14th century, when Sufism pervaded Muslim religious life, the *ribat* became a Sufi institution, often called a *zawiya*, and the *murabit* in the Maghreb came to be any preacher calling for the formation of Sufi confraternities according to the "order" (*tariqa*) of Abu Madyan. Thus the word *murabit* lost all trace of its original literal meaning of military defense and the *murabit* began to affix to his name the word "*sidi*" (the Maghrebi version of the classical Arabic *sayyidi*) meaning "my lord," or the word "moulay" or "mulay" ("my master"). A *ribat* came to be called after its leading *murabit*, who was often buried in the place. Thus, particularly in Algeria, marabout came to be used for the *ribat* or *zawiya* in which a pious religious man is buried. (F. B. A.)

MARACAIBO, second largest city in Venezuela, the country's most important seaport and capital of the state of Zulia, is situated in the northwestern corner of the country on the west

shore of the channel connecting Lake Maracaibo with the Gulf of Venezuela. Pop. (1961) 432,902. The city was a primitive coffee-exporting port of 40,000, mostly Indians and Negroes, until petroleum was discovered in 1917. Within a decade Maracaibo became the country's oil metropolis, with paved streets, modern public services, tall office buildings, golf clubs, air-conditioned hotels, supermarkets and very substantial dwellings. Its population more than doubled during the 1920s, in spite of the climate. The city is located in a basin surrounded by higher land which prevents the steady trade winds from relieving the oppressive humidity. The annual average temperature is 28° C. (82° F.), ranging from an average of 27° (80°) in January to an average of 29° (84°) in August. The oil companies set up headquarters there, the government erected new buildings and the city installed electricity. Attractive modern suburbs reached out in all directions. Commerce thrived but living costs doubled.

Because of its strategic location near the outlet of the lake Maracaibo has long been important as a trading centre although the channel connecting the lake with the Caribbean was too shallow to permit the passage of large ocean freighters and tankers. A major dredging operation completed in 1957 (see MARACAIBO, LAKE) provided a major stimulus to the economy of all of northwestern Venezuela and quickened the entire maritime life of the city.

In addition to being one of the most important petroleum-exporting ports in the world, the city exports cacao, coffee, hides, fruits, vegetable oil and timber. It imports manufactured products of all kinds and considerable food. It also serves as the transshipment point for nearly all the trade for northwestern Venezuela.

Maracaibo's oil industry is the result of foreign enterprise. Powerful oil groups own all the major concessions. Billions of dollars of American, British and Dutch capital have been invested, but in 1956 Venezuelan capital, in alliance with foreigners, entered the industry. (L. Wz.)

Maracaibo's wealth dates from the 20th century but its history goes back to the age of exploration. It was founded in 1571 by Alonso Pacheco, who gave it the name of Nueva Zamora. The shipment point for the inland settlements was originally a station named Gibraltar at the head of the lake, but its destruction by pirates in 1669 transferred this trade to Maracaibo. The city did not figure actively in the war for independence until Jan. 28, 1821, when the province declared its independence and alliance with Colombia. This ended the armistice between Simón Bolívar and Pablo Morillo and thereafter the city experienced the changing fortunes of war until its final capture by the revolutionists in 1823. In the years of destructive civil war, Maracaibo was usually much less involved than eastern and central Venezuela.

MARACAIBO, LAKE (LAGO DE MARACAIBO), a large lake in the northwestern corner of Venezuela, lies in the Maracaibo lowland immediately to the east of the Sierra de Perijá. It extends southward from the Gulf of Venezuela, into which it opens through a long neck. Roughly shaped like an oil drop hanging from a spout, the lake is 133 mi. long and 72 mi. wide and covers an area of about 5,000 sq.mi. In the southern portion the lake water is fresh but in the northern portion, where the tidal influence is stronger, it is somewhat brackish.

Lake Maracaibo receives the waters of many rivers, principally from the west and south sides. The heavy rainfall on the eastern slopes of the Eastern Cordillera (more than 86 in. annually) is responsible for the great volume of water discharged into the lake. The average annual precipitation over the entire basin is about 70 in. The area around the lake is hot and humid and its average temperature is reported to be the highest in South America.

Lake Maracaibo is the centre of the petroleum industry of Venezuela and of Latin America. About 90% of the oil produced is exported, but until 1957 the northern outlet of the lake was obstructed by a very large sand bar which allowed only shallow-draft (17,000 ton) tankers to enter and leave the lake. In that year, after many months of dredging and at a cost of \$48,000,000, a new channel 35 ft. deep and 21 mi. long was opened. Now fully

loaded 33,000-ton tankers are able to leave the lake.

The Lake Maracaibo basin (including the lake and adjacent land area) is one of the world's richest and best located oil-producing areas. Particularly outstanding are the 65 mi. along the east shore and the 15 mi. out into the lake. Thousands of derricks protrude from the water and thousands more line the shore. Underwater pipelines transport the oil to storage tanks on the land. Well over one-third of Venezuela's total oil production comes from Lake Maracaibo. As oil contributes over 90% of the country's foreign exchange and many national revenues, the economic importance of Lake Maracaibo is considerable.

Much natural gas (wet gas) is obtained with the oil. For many years billions of cubic feet of this fuel were flared off, since there was no appreciable market. In the middle 1950s a petroleum corporation installed three plants several miles offshore for reinjecting gas into the oil-bearing formation with the purpose of recovering more oil and of conserving gas for potential future use. Enough pressure is put on the oil in the deposit to increase immediate production by 50% and ultimate recovery by 30%. One of these plants injects 300,000,000 cu.ft. of gas per day into the reservoir it serves.

Until 1918 Lake Maracaibo basin was one of the poorest and least important areas in the country. The people made a miserable living ignorant of the potential wealth at their feet. The oil industry there is the result of foreign (chiefly American, British and Dutch) enterprise, technological skills and capital. In the early 1960s less than 5% of the total production came from Venezuela-owned wells.

(L. We.)

MARACAY, capital of Aragua state in Venezuela. Pop. (1961) 134,123. A handsome city, it lies about 76 mi. W. of Caracas in the central highlands at an elevation of 1,500 ft. It was but a sleepy town until the dictator Juan Vicente Gómez transferred his centre of activities there from Caracas. During his long dictatorship (1908–35) he built up Maracay until it became the actual if not the nominal capital of the country. The city is situated in excellent cattle country; by gaining possession of these pastures, Gómez virtually cornered the entire Venezuela cattle industry. He built a modern dairy plant and slaughterhouse at Maracay, and then supplied the urban market in Caracas with the products of these enterprises.

Determined to make the city the cultural and social centre of the nation, Gómez constructed the Hotel Jardín, with its Moorish arcades, second-story balconies, gracious patio and beautiful park and fountain; an opera house (never completed); a bull ring (an exact replica of the one in Seville); and military airports. The current importance of the city lies in its military training institutions and its school of agriculture and experiment station.

(L. We.)

MARAGHEH (MARAGHA), the chief town of a *shahrestan* (district) in East Azerbaijan *ostan*, Iran, on the southern slopes of Kuh-e Sahand (12,138 ft.), south of Tabriz. The town is pleasantly situated in a well-watered valley, opening toward a richly cultivated plain which merges into the salty southeastern shores of Lake Rezaiyeh (Urmia). The population, mainly of Azeri Turkish stock, was 36,556 in 1956. Since 1958 Maragheh has been connected by railway with Tabriz and Teheran, and by metalled roads with Tabriz and southward with Mahabad and Kermanshah. It is the moderately prosperous centre of a large fruit-growing district, and its exports are mainly dried fruits. Modern development has been slow.

Once a Persian-speaking city, Maragheh played a prominent role under several Turkish princes in the middle ages. Its zenith was reached during the reign of the first Ilkhan, the Mongol Hulagu (1256–65), who made it his capital. The two stone bridges crossing the Saffi Chai are ascribed to him. Five tomb towers dating from the 12th to 14th centuries are the most notable monuments. The earliest, Gunbad-i-Surkh (1147), is one of the finest examples of brickwork in Iran. On a hill west of the town are traces of the famous observatory constructed in 1259 for the great astronomer Nasir-ud-Din of Tus (Nasir al-Din al Tusi). The stone, which is known throughout Iran as Maragheh marble, is a travertine of yellow, pink, greenish or milkwhite colour streaked with red and

green veins, which hardens after being worked. It is mainly quarried at Azar Shahr (formerly Dashkesan), 30 mi. N.W. of Maragheh.

(H. Bo.)

MARAI, MARIN (1656–1728), French composer and virtuoso viola da gamba player, was born in Paris on March 31, 1656. He was a choirboy in the Sainte-Chapelle in Paris and studied the viola da gamba under Hautmann and Sainte-Colombe. From 1685 onward he played in the royal orchestra and shared with Pascal Colasse the direction of the orchestra of the Académie Royale de Musique, where he studied for a short time with J. B. Lully. In 1686 Marais published his first book of pieces for two viols, and in 1693 brought out his setting of *Alcide*, in which he collaborated with Louis de Lully. His other operas were *Ariane et Bacchus* (1696), *Alcyone* (1706) and *Sémélé* (1709), but of these only *Alcyone* was really successful, although the others contain much good music. Meanwhile Marais produced several more books of *Pièces de Violes* (1701, 1711, 1717, 1725), in which genre he was the acknowledged master. He retired in 1725 but continued to give a few lessons. He died in Paris, Aug. 15, 1728. His family continued to publish music and instruction books for the viola da gamba.

(Cs. Ch.)

MARAJÓ, an island at the mouth of the Amazon river in Brazil, 183 mi. long and 124 mi. wide; area 15,444 sq.mi. The main flow of the Amazon passes to the north of Marajó, but numerous *furos* or narrow passages direct part of the water into the Pará river, an estuary that separates the island from the mainland to the south. The densely forested western half of the island is part of the overflow land (*várzea*) of the Amazon, but the slightly higher eastern half, underlain by sandstone, has extensive areas of treeless savannas (*campos*), which support large herds of cattle. Numerous archaeological mounds in the northeastern part of the island are rich in well-made pottery vessels and other objects that suggest an affinity with pre-Columbian Andean cultures. Soure, a modern town and beach resort on the Atlantic coast, is linked to Belém by overnight ferry service.

(Js. J. P.)

MARANHÃO, a northern state of Brazil, bounded north by the Atlantic, east and southeast by Piauí, southwest and west by Goiás and Pará. Area 126,897 sq.mi. Pop. (1960) 2,492,139. The coastal zone and the northwest corner of the state belong to the Amazon valley region, being a heavily forested plain traversed by numerous rivers. The eastern and southern parts, however, belong to the lower terraces of the great Brazilian plateau, broken by eroded river courses between which are high open plains. There are no true mountain ranges in Maranhão, those indicated on the maps being only plateau escarpments marking either its northern margin or the outlines of river valleys. The climate is hot, and the year is divided into wet and dry seasons, though no part of the year is rainless. Extreme humidity is characteristic of the wet season. The heat, however, is greatly modified on the coast by the southeast trade winds.

The coast itself is broken and dangerous, there being many small indentations, which are usually masked by islands or shoals. The largest of these are the Bay of Turiaçu, facing which are the island of Tocansa and several others of small size, and the contiguous bays of São Marcos and São José, between which is the large island of São Luís, the site of the city of São Luís. The rivers of the state all flow northward to the Atlantic, and a majority of them have navigable channels. The Parnaíba forms the eastern boundary while the Tocantins and the Gurupí bound the state on the west.

The principal industries of Maranhão are agricultural, the highly fertile river valleys and coastal zone being devoted to the cultivation of sugar cane, cotton, rice, coffee, tobacco, *manioc* (cassava) and a great variety of fruits. Babassu nuts are an important export. The southern highlands are devoted to cattle raising. Phosphatic bauxite deposits that occur on Turiaçu Island at the mouth of the Maracacumé river are undeveloped. In 1956 oil was discovered at Balsas, deep in the interior near the Goiás border. A railway, 250 mi. long, crosses the eastern part of the state connecting São Luís on the coast with Teresina, the capital of Piauí.

The capital is São Luís, pop. (1960) 124,606; other principal

towns, with their population in 1960, are: Caxias (19,092); Pedreiras (10,189); Rosário (6,999); and Viana (5,385).

The coast of Maranhão was first discovered by Vicente Yáñez Pinzón in 1500, but it was included in the Portuguese grant of captaincies in 1534. The first European settlement was made by a French trading expedition under Jacques Riffault of Dieppe in 1594, who left a part of his men there when he returned home. Subsequently Daniel de la Rivardière, commissioned by the French crown, founded a colony on São Luís Island in 1612. The French were expelled by the Portuguese in 1615 and the Dutch held the island from 1641 to 1644.

In 1621 Ceará, Maranhão and Pará were united and called the Estado do Maranhão, which was made independent of the southern captaincies. Ceará was later detached, but the state of Maranhão remained independent until 1774, when it became subject to the colonial administration of Brazil. Maranhão did not join in the declaration of independence of 1822, but in 1823 the Portuguese were driven out by Admiral Lord Cochrane and the province became a part of the empire of Brazil. (Js. J. P.)

MARañÓN, a river of northeast Peru, rising in Lake Lauricocha in the southwest of Huánuco department, just north of Cerro de Pasco, about 100 mi. from the Pacific ocean. It flows 350 mi. northwest between mountain ranges before descending eastward to enter the Amazon basin.

The Marañón, together with the Ucayali (*q.v.*) and Huallaga rivers which join it downstream, is one of the principal affluents of the Amazon (*q.v.*). From its source, a series of unnavigable rapids characterize the Marañón for a distance of 350 mi.; it drops from a height of 12,000 ft. in the Andes to 575 ft. above sea level at Pongo de Manseriche. Navigation is only possible below Manseriche. The Marañón is navigable to Limón, a distance of 484 mi. (during both high and low water), for steamers of 4- to 8-ft. draft. From Limón to Manseriche, a distance of 74 mi., it is navigable by vessels of 2- to 4-ft. draft at any season.

The Marañón flows through a forested, sparsely inhabited region. Climatic conditions vary from a mountain climate in the upper extension of the river to rainy tropical in the Amazon basin. (J. L. Tr.)

MARANTACEAE, the arrowroot family of monocotyledonous perennials, all tropical and mainly American. The West Indian *Maranta arundinacea* is the source of arrowroot (*q.v.*). Various species of *Maranta* and *Calathea* are cultivated for their ornamental foliage as house plants. *Thalia* species, cannalike swamp plants, occur in the warmer parts of the world.

MARA REGION, TANGANYIKA, established in May 1963 following a reorganization of administrative units in Tanganyika, comprises North Mara, Musoma and Ukerewe mainland districts, formerly part of Lake region. Area 11,000 sq.mi. (including 3,000 sq.mi. of water); pop. (1957) 347,587. It is bounded north by Kenya, west by Lake Victoria, southwest by Mwanza region, south by Shinyanga region and east by Northern (Arusha) region.

The gently undulating landscape of peneplained granites and volcanic rocks, overlain in parts by volcanic ash and Recent sediments, is broken by hills of banded ironstone and granite tors, and rises eastward from lake level at 3,720 ft. to 5,000–6,000 ft. The Mara, Grummetti and other rivers drain to Lake Victoria, where the drowned shore line is sinuous. Rain, falling mainly November–December and March–May, increases from 20–30 in. in the southeast to 40–50 in. in the lake basin, although the weather is somewhat drier along the lake shores where storms tend to drift westward with the prevailing wind. Soils vary with topography, but are mostly derived from granite. Wooded grassland with acacia is characteristic.

The regional headquarters is at Musoma. The population is dense near the lake, where cotton is grown together with maize (corn), millet, peanuts, rice and sesame. Farther east the population is sparse. The main tribes are the Sita, Kuria, Luo, Kwaya and Zanaki. Pastoralism is everywhere important, despite the prevalence of the tsetse fly, and there is fishing from the lake shores. Part of the region lies within the Serengeti national park where a great wealth of wild life is a tourist attraction. There

are gold mines in North Mara and in Musoma, where the Kiabakari mine is the largest producer in Tanganyika. Lake steamers call at Musoma, which is connected by road with Kenya and central Tanganyika through Mwanza, and by air with Nairobi and Mwanza. (J. M. Ke.)

MARAS (MARASH), a city of Turkey and capital of a mountainous *il* (province) of the same name, is situated east of the Ceyhan Nehri (ancient Pyramus river), on the edge of a fertile plain below Ahir Dagi in the Taurus mountains, 80 mi. N.N.E. of Iskenderun. Population, 54,447 in 1960, is heavily Armenian.

The city, on the Cilicia-Kurdistan railway line and near the southern outlets of three important mountain passes (from Gök-sun, Elbistan and Malatya), is a centre of light industry and commerce. An old Seljuk castle towers above the town, which has several mosques, churches and schools, including an American mission and college. During most of the year the climate is temperate.

Maras was one of the post-Imperial Hittite city-states during the early 1st millennium B.C., known as Marqasi (Markasi) to the conquering Assyrians. A variety of sculptured monuments of that period, including a gate lion inscribed with Hittite hieroglyphs, have been discovered. In Roman times it reappears as Germanicia Caesarea (later Germanicia Marasion, or on coins Caesarea Germanice) of the region then known as Commagene (hence the Armenian name Kermanig). It was conquered by Muslims before 700 A.D., and was subsequently rebuilt by the Khalif Mu'awiya. It figured in the struggles with the Byzantines; after 770, however, it remained in the hands of Harun al-Rashid (*c.* 800), who strengthened its fortifications. The crusaders captured it in 1097 during their march on Antioch, and the Seljuks took it in 1147. During the 16th century it became part of the Ottoman empire.

MARAS IL (area 5,634 sq.mi.) had a population of 389,857 in 1960. It is drained by the Ceyhan Nehri. There are rich mineral deposits (iron, silver) near Maras city, and wheat, rice and legumes are grown in the fertile areas. (J. Pl.)

MARAT, JEAN PAUL (1743–1793), one of the most virulent journalists of the French Revolution and a leader of the extremists in the Convention, was born at Boudry, in the principality of Neuchâtel, Switz., on May 24, 1743, the son of a Sardinian father and a Swiss mother. After studying medicine in Bordeaux and Paris, he became a physician in London and received an honorary degree of doctor of medicine from the University of St. Andrews in 1775. He published several tracts on philosophical and scientific subjects and one on politics. After returning to France he held the post of physician to the bodyguard of the comte d'Artois (later Charles X of France) from 1777 to 1783, combining with it a lucrative private practice of medicine. He continued to publish scientific and philosophical works that won some recognition, but he failed to secure election to membership in the Académie des Sciences, which he most desired.

At the beginning of the French Revolution in 1789, Marat became a political journalist. After issuing some tracts favouring the Revolution, he began to publish, on Sept. 12, a daily paper which, from Sept. 16, carried the name *Ami du Peuple*. Assuming the role of friend of the people, the guardian of their interests and the denouncer of their enemies, Marat at first expressed confidence that the Revolution could be achieved by the co-operation of Louis XVI and the National Assembly. By early October, however, he was berating the municipality of Paris and certain deputies and ministers at Versailles; on Oct. 8 he was condemned by the Paris court of the Châtelet for abetting the attack on Versailles of Oct. 5–6. He then went into hiding for a time, but soon resumed publication. Because of his virulence the Châtelet ordered his arrest in Jan. 1790, but he escaped and fled to England.

Returning in April 1790, Marat directed his invective against almost every conspicuous person. His appeal was no longer to the middle class, but to the workers and the poor, whom he called upon to form popular clubs to direct the Revolution. Suspecting counterrevolutionary activities in many places, he grew more and more immoderate. By midsummer 1790 other journalists

were following his lead, and together they made a formidable attack on the advocates of moderation. Marat gradually won the confidence of many of the lower classes as their political self-consciousness awakened, in no small measure because of his dramatic tirades against "suspects." His pamphlet, *C'en est fait de nous* (July 26, 1790) called for violence: "Five to six hundred heads cut off would have assured your repose, freedom, and happiness. A false humanity has held your arms and suspended your blows. It will cost the lives of millions of your brothers . . . The National Assembly will do nothing more for the people's welfare." This diatribe brought an indictment from the National Assembly, but Marat, in hiding, continued to publish his journal. After the royal family's flight from the capital (June 20, 1791), he urged the people to elect a temporary dictator, apparently meaning himself, to rid them of their enemies, and he demanded the execution of Louis XVI. When the National Assembly took no such action, Marat dubbed many of its deputies "traitors," but soon found his own position so precarious that he again fled from Paris. As a candidate for the Legislative Assembly in Sept. 1791, he received only two votes, and in December he retired to England. Even so his journal's reputation was so great that during his absence several papers appeared purporting to be his *Ami du Peuple*.

In the spring of 1792 Marat returned to Paris and began once more to publish his paper. His opposition to the declaration of war against Austria brought an indictment against him on May 3, but he went into hiding again and managed to continue publication. His frequent hiding was rapidly undermining his health. By midsummer, suspecting the authorities and the generals on the frontier of treason, he urged the Parisians to rise, to secure the royal family as hostages, to place the deputies under surveillance and to substitute patriots for the treacherous generals. His appeals probably contributed to the insurrection of Aug. 10, which led to the suspension of the monarchy. After this revolution, Marat came out of hiding. The military disasters of August led him to write: "Rise and let the blood of traitors flow again. It is the only means of saving the *patrie*." On Sept. 2, when the Paris populace began the lynchings known as the September massacres, he joined the Paris committee of police and surveillance; and on the following day he approved the massacres. He continued his journal and was elected to the Convention as a deputy for Paris (Sept. 9).

Though previously he had not advocated a republican form of government, Marat accepted the republic decreed on Sept. 22, 1792; and on Sept. 25 he changed the name of his paper to *Journal de la République française*. He conceived of the Revolution as a movement for the welfare of the lower classes, though he had little faith in the ability of the people to govern themselves and often urged them to choose a dictator. Since king, clergy and nobles seemed to have been vanquished, the enemies of the people were now the rich, whose property must be shared with the poor. Marat demanded the trial of Louis XVI by the Convention and voted for his execution (Jan. 1793). He also favoured the establishment of the Revolutionary tribunal and of the committee of public safety, which eventually became the instruments of the Terror. Since the Girondins (*q.v.*) disagreed with him, Marat launched a vitriolic attack on them in his journal and found himself a target for their denunciation in the Convention. In the Paris club of the Jacobins, of which he was then president, he accused the Girondins of complicity with General Dumouriez on the latter's desertion to the Austrians. The Convention, under Girondin leadership, passed a decree (April 14), indicting Marat for preaching pillage and murder, for attempting to destroy the sovereignty of the people and for urging the dissolution of the Convention. Marat's acquittal by the Revolutionary tribunal (April 24) was a serious blow to the Girondins; and on June 2 the Convention, now dominated by him, ordered the arrest of the Girondin leaders.

By this time, Marat was too ill to profit from his triumph. As early as 1788 he had contracted a skin disease, which had been aggravated by living in underground hiding places; and now his lungs were infected as well. He could find relief from pain only

by warm baths. The rebellions encouraged by the Girondins in the provinces called forth his demands for ruthless suppression. On July 13, 1793, a young follower of the Girondins from Normandy, Charlotte Corday (*q.v.*), gained entrance to Marat's apartment and stabbed him to death in his bath. (See also FRANCE: History: September Massacres; FRENCH REVOLUTION.)

There is an edition of Marat's works by A. Vermorel (1869). His correspondence is edited by C. Vellay (1908).

MARATHA (MAHRATTA, MAHRATTI), a major people of India, famed in history as yeoman warriors and champions of Hinduism. Their homeland is Maharashtra (*q.v.*), the Marathi-speaking region of peninsular India, which extends from Goa, Bombay city and Thana district on the Arabian sea eastward for 800 mi. to a point about 100 mi. east of Nagpur.

The term Maratha is used in three overlapping senses: within the Marathi-speaking region it refers to the single dominant Maratha caste or to the group of Maratha and Kunbi castes, which included between 7,000,000 and 9,000,000 persons in the 1960s (see MAHAR); outside Maharashtra, the term often loosely designates the entire regional population speaking the Marathi (*q.v.*) language, numbering more than 27,000,000; used historically, the term denotes the regional kingdom founded by the Maratha leader Sivaji in the 17th century and expanded to the status of an empire by his successors of many castes in the 18th century.

The Maratha caste, or group of castes, is a largely rural class of peasant cultivators, landowners and soldiers. Some Marathas and Kunbis have at times claimed Kshatriya (*q.v.*) standing, and supported their claims to this rank by reference to clan names and genealogies linking themselves with epic heroes, Rajput clans of the north, or historic dynasties of the early medieval period (see CASTE [INDIAN]). Beginning in the 1920s and led by the Chhatrapati maharaja of Kolhapur, many Marathas evidenced a new interest in education, put on the sacred thread of the twice-born Hindu castes, and declared that they would continue to employ Brahman priests to conduct their rites only if the Brahmans would recite the Vedic words previously denied to Marathas as presumed members of the low-caste Shudra class. This non-Brahman movement, strongest in southwestern Maharashtra, symbolized the rise of Marathas to modern political awareness as well as their opposition to the previous Brahman control of many higher offices and professions.

The Maratha and Kunbi group of castes is divided into sub-regional groupings of coast, western hills and Deccan plains, among which there is little intermarriage. Within each sub-region, clans of these castes are classed in social circles of decreasing rank. A maximal circle of 96 clans is said to include all true Marathas, but the lists of these 96 clans are highly various and disputed. Beyond this outer circle are many clans that still claim to be Marathas, and still further out are the many allied Kunbi groups. A structure of similar type tends to take shape in each subregion through repeated marriages in which grooms of the higher clans take brides from equal or lower clans, preferring by custom to marry their own mothers' brothers' daughters. In western Maharashtra, about 1930, several millions of former Kunbis in search of prestige and wider political solidarity began calling themselves by the formerly aristocratic caste name, Marathas. In the areas of Khandesh, Berar and Nagpur, however, the caste name Kunbi is retained throughout the social hierarchy.

In physical type the large Maratha group of castes shows much variation by subregion. Occasional roundheadedness and a relatively low incidence of blood type B distinguish Marathas from the averages of the Indian population as a whole and suggest minor genetic affiliations toward the west. However, the same features join Marathas with many other apparently indigenous peoples of western India.

The once-powerful Maratha empire holds an important place

in the history of India. It is often stated that British conquest or annexation in India succeeded Muslim rule under the Mogul empire, and to a considerable extent that was the case. However, the principal power and the widest sovereignty that the British overthrew in India was that of the Maratha empire. During the earlier Muslim invasions beginning in the 12th century A.D., the Marathas do not seem to have made much resistance. The historic rise of the Marathas occurred in a time of Hindu religious reform and unrest under the narrowly Muslim policies of the Mogul emperor Aurangzeb (q.v.). In the 17th century Sivaji (q.v.) led his fellow Marathas against the Muslims. Although he and his fighting officers were Hindus of humble caste, his ministers were Brahmans. When the Mogul empire absorbed the Bijapur kingdom he defied the emperor. He imparted a self-reliant enthusiasm to his countrymen; his outnumbered mountaineer infantry proved desperately courageous, his cavalry unusually daring. Sivaji seized hill forts and plundered neighbouring territories until he held the entire western half of Maharashtra. The new state which he founded was maintained in the face of violent resistance after his death, and the Maratha upsurge continued on a widened scale. At Poona, the centre of Maratha territories, power passed in the 18th century to a line of Chitpavan Brahmans serving as peshwas (prime ministers) to the weaker descendants of Sivaji. Peshwa Baji Rao I founded the Maratha empire in 1739 by annexing a large part of northern India; ultimately a number of independent or loosely allied Maratha states were established at Baroda, Indore, Gwalior, Berar, Nagpur, Tanjore and elsewhere, supplanting the Moguls. The armies of the Maratha empire, although drawn from all parts of India (see PINDARI) in enormous numbers (the cavalry alone included about 100,000 men), began to encounter difficulties in attempting to adopt the modern methods of the British and French advisers who entered Maratha service. Thus, when Ahmad Shah Durrani (q.v.) invaded from Afghanistan, the Marathas were badly defeated near Delhi (1761). However, it was collision with the British that finally shattered the Maratha confederation. Between 1778 and 1818 the British (see WELLINGTON, ARTHUR WELLESLEY) fought three wars with the disunited Maratha powers which led to full British supremacy. MARATHI (or *Marāṭhī*) is the name of an important Indo-Aryan language spoken in western and central India.

Marathi occupies an irregular triangular area of approximately 100,000 sq.mi., having its apex about the district of Balaghat in the Madhya Pradesh (old Central Provinces) and for its base the western coast of the peninsula from Daman on the Gulf of Cambay in the north to Karwar on the open Arabian sea in the south. It covers parts of Maharashtra and Madhya Pradesh states with numerous settlers in central India and Madras, and is also the principal language of Goa and of the northwestern portion of Hyderabad. The standard form of speech is Poona in Maharashtra, and in its various dialects it covers the larger part of that state; it became the official language of Maharashtra in 1966.

Dialects.—Besides the standard form of speech, there is only one real dialect of Marathi, viz., Konkani (*Kōṅkaṇī*), spoken in the country near Goa. There are also several local varieties; the Marathi of the Deccan, that of Madhya Pradesh (including Berar) and that of the northern and central Konkani are distinguishable. In the southern part of the district of Ratnagiri this latter Konkani variety of Marathi gradually merges into the true Konkani dialect through a number of intermediate forms of speech. There are also several broken jargons, based upon Marathi, employed in the hill country.

Relations With Other Indo-Aryan Languages.—Marathi has to its north, in order from west to east, Gujarati, Rajasthani, Western Hindi and Eastern Hindi. To its east and south it has

the Dravidian languages, Gondi, Telugu and Kanarese. Marathi does not merge into any of the cognate neighbouring forms of speech, but possesses a distinct linguistic frontier. This isolated character of Marathi is partly due to the barrier of the Vindhya range which lies to its north and partly to the fact that none of the northern languages belongs now to the Outer Band, but they are in more or less close relationships to the language of the Midland (according to G. A. Grierson's classification). Eastern Hindi is more closely related to Marathi than the others, and in its bordering dialects may be found few traces of the influence of Marathi.

Written Character.—Marathi books are generally printed in the Nagari character, and this is also used in private transactions and correspondence. In the Maratha country it is known as the *Bālbōdh* ("instructing children," i.e., "easy") character. A cursive form of Nagari called *Mōḍī*, or "twisted," is also employed as a handwriting. It is said to have been invented in the 17th century by Balaji Avaji, the secretary of the celebrated Sivaji. Each word can be written as a whole without lifting the pen from the paper.

Origin of the Language.—The word "Marathi" signifies the language of the Maratha country. It is the modern form of the Sanskrit *Māhārāṣṭrī* just as "Maratha" represents the old *Māhārāṣṭra*, or Great Kingdom. *Māhārāṣṭrī* was the name given by Sanskrit writers to the Prakrit spoken in Māhārāṣṭra, the great Aryan kingdom extending southwards from the Vindhya range to the Kistna, broadly corresponding to the southern part of Bombay state and to the state of Hyderabad. This *Māhārāṣṭrī* became the form of Prakrit employed as the language of lyric poetry and of the formal epic (*kāvya*). Dramatic works were composed in it, and it was the vehicle of the noncanonical scriptures of the Jaina religion. The oldest work in the language is the *Sattasai*, or "Seven Centuries of Verses," compiled at Pratisthāna on the Gōdāvarī, the capital of King Hāla, at some time between the 3rd and 7th centuries A.D.

General Character of the Language.—The Prakrits fall into two well-defined groups, an Inner, Śaurāṣēni, and its connected dialects on the one hand, and an Outer, *Māhārāṣṭrī*, Ardhamāgadhī and Māgadhī with their connected dialects on the other. These two groups differ in their phonetic laws, in their systems of declension and conjugation, in vocabulary and in general character. Suffixes such as *-alla*, *-illa*, *-ulla*, etc., can be added to any noun, adjective or particle in *Māhārāṣṭrī* and Ardhamāgadhī, but are hardly ever met in Śaurāṣēni. These give rise to numerous secondary forms of words, which give a distinct flavour to the whole language.

Vocabulary.—*Māhārāṣṭrī* Prakrit, the most independent of the Outer languages, was distinguished by the large proportion of *dēśyas* (vocables whose origin cannot be traced to original Indo-Aryan sources) found in its vocabulary, and the same is consequently the case in Marathi, although the proportion of *tatsamas* (words identical with Sanskrit words) to *tadbhavas* (words derived from Sanskrit) in the language is fairly high. The proportion of Persian and, through Persian, of Arabic words in the Marathi vocabulary is comparatively low.

Phonetics.—In the standard dialect the vowels are the same as in Sanskrit, but *r* and *l* only appear in words borrowed directly from that language (*tatsamas*). Final short vowels (*a*, *i* and *u*) have all disappeared in prose pronunciation, except in a few local dialects, and final *i* and *u* are not even written. After an accented syllable a medial *a* is pronounced very lightly, even when the accent is not the main accent of the word. Almost the only compound consonants which survived in the Prakrit stage were double letters, and in Marathi these are usually simplified, the preceding vowel being lengthened in compensation. It is not usual to lengthen the vowel in compensation in Konkani, which appears to contain many relics of the old Prakrit (*Saurāṣṭrī*) spoken in the Gujarat country before the invasion from the Midland.

On the whole, the consonantal system is much the same as in other Indian languages. Nasalization of long vowels is very common, especially in Konkani. The palatals are pronounced as in

Sanskrit, in words borrowed from that language or from Hindustani, and also in Marathi *tadbhavas* before *i, ī, ē* or *y*. In other cases they are pronounced *ts, tsh, dz, dzh* respectively. There are two *s*-sounds in the standard dialect which are very similarly distinguished: *ś*, pronounced like an English *sh*, is used before *i, ī, ē* or *y*; and *s*, as in English "sin," elsewhere. In the dialects *s* is practically the only sibilant used, and that is changed by the vulgar speakers of Konkani to *h*. Aspirated letters show a tendency to lose their aspiration, especially in Konkani. Generally speaking, Marathi closely follows Māhārāṣṭrī when that differs from the Prakrits of other parts of India. There is, similarly, both in Marathi and Māhārāṣṭrī a laxness in distinguishing between cerebral and dental letters.

Declension.—Marathi retains the three genders, masculine, feminine and neuter. In Marathi the neuter denotes both inanimate things and animate beings when both sexes are included, or when the sex is left undecided. In the Konkani the neuter gender is further employed to denote females below the age of puberty. Numerous masculine and feminine words, however, denote inanimate objects. The rules for distinguishing the gender of such nouns must be learned from the grammars. For the most part, but not always, words follow the genders of the Sanskrit originals. Strong bases in *ā*—and these do not include *tatsamas*—are masculine, and the corresponding feminine and neuter words end in *ī* and *ē* respectively. Sex is usually distinguished by the use of the masculine and feminine genders, and large and powerful inanimate objects are generally masculine, while small delicate things are generally feminine. In the case of some animals sex is distinguished by the use of different words.

A pleonastic suffix of *-(a)ka* (masculine and neuter) could in Sanskrit be added to any noun, whatever the termination of the base might be. Modern forms made with this pleonastic suffix and ending in *ā, ī* or *ē* are called strong forms, while all those made without it are called weak forms. As a rule the fact that a noun is in a weak or strong form does not affect its meaning, but sometimes the use of a masculine strong form indicates clumsiness or hugeness. Other pleonastic suffixes are employed in Marathi, usually with specific senses. Thus the suffix *-illa* generally forms adjectives, while *-ḍa-ka* implies contempt.

The synthetic declension of Sanskrit and Prakrit has been preserved in Marathi more completely than in any other Indo-Aryan language. In the formation of the plural the Prakrit declensions are very closely followed by Marathi.

The usual postpositions are: (1) Instrumental: *nē*, plural *nē*, "by." (2) Dative: *lā*, plural also *nā*, "to" or "for." (3) Ablative: *hām, ūm*, "from." (4) Genitive: *tsā*, "of." (5) Locative: *āi*, "in."

The accusative is usually the same as the nominative, but when definiteness is required the dative is employed instead. The termination *nē*, with its plural *nē*, is really the oblique form, by origin a locative, of the *nā* or *nō*. The suffix *nā* of the dative plural is derived from the same word. For the postposition *lā*, "for the benefit of," compare Hindi *liyē* and Gujarati *lidhē*. The genitive *tsā* is really an adjective meaning "belonging to the house," and agrees in gender, number and case with the noun which is possessed. The suffixes *tsā, cī, cē*, are derived from the Sanskrit suffix *īyakas*, Prakrit *caō*, which is used in much the same sense.

Strong adjectives, including possessive adjectives, can be declined like substantives, and agree with the qualified noun in gender, number and case. Weak adjectives are not inflected in modern prose, but are inflected in poetry. Comparison is effected by putting the noun with which comparison is made in the ablative case.

The pronouns closely follow the Prakrit originals. There is no pronoun of the third person, its place being supplied by the demonstratives. In all the plural is employed honorifically instead of the singular.

Conjugation.—Marathi has two conjugations. The first as a rule consists of intransitive verbs, and the second, corresponding to the *e-* or causal-class, of transitive verbs, but there are numerous exceptions.

In Marathi the old present has taken on the meaning of a habitual past. It is also the base of the Marathi future, which is

formed by adding *l*, or in the first person singular *n*, to the old present. In the second person singular the *l* has been added to a form derived from the Prakrit *uṭṭhasi*, which is also the origin of the old present *uṭṭhēs*. The remaining tenses are modern forms derived from the participles. The conjunctive participle is derived from the Apabhramśa form *uṭṭhiu*, to which the dative suffix *n* (old Marathi, *ni, niyā*) has been added.

Various tenses are formed by adding personal suffixes to the present, past or future passive participle. When the subject of the verb is in the nominative the tense so formed agrees with it in gender, number and person. In the present, the terminations are relics of the verb substantive, and in the other tenses of the personal pronouns.

The present tense is formed by compounding the present participle with the verb substantive. Further tenses are similarly made by suffixing, without compounding, various tenses of the verb substantive to the various participles.

Literature.—The modern vernacular literature of the Maratha country arose under the influence of the religious reformation inaugurated by Rāmānuja early in the 12th century. The earliest writer is Nāmdēv (13th century), whose hymns in honour of Vithoba, a personal form of Vishnu, are found in the Sikh *Ādi Granth*. Dnyānōbā, a younger contemporary, wrote a paraphrase of the Sanskrit *Bhagavad Gītā*, which is still much admired. Sivaji was a disciple of Rāmdās (1608–1681), who exercised great influence over him, and whose *Dāsbōdh*, a work on religious duty, is a classic. Contemporary with Rāmdās and Sivaji was Tukārām (1608–1694), a Śūdra by caste, the greatest writer in the language. Being unsuccessful both in his business and in his family relations, he abandoned the world and became a wandering ascetic. His *Abhangs* or "unbroken" hymns are famous in the country of his birth, but do not rise to any great height as poetry. Other Marathi poets are Śrīdhār (1678–1728), who translated the *Bhāgavata Purāṇa*, and the learned Mayūra or Mōrōpant (1729–1793). Mahipati (1715–1790) was an imitator of Tukārām, who collected the popular traditions about national saints.

Lāvāṇis or erotic lyrics by various writers are popular, and by western standards hardly proper. The *Pawāḍas* or war ballads, mostly by nameless poets, are sung everywhere throughout the country. There is a small prose literature consisting of narratives of historical events (the so-called *Bakhars*), moral maxims and popular tales.

Konkani once had a literature of its own, which is said to have been destroyed by the Inquisition at Goa. Temples and manuscripts were burned wholesale. Under Roman Catholic auspices a new literature arose, the earliest writer being an Englishman, Thomas Stephens (Thomaz Esteyāo), who came to Goa in 1579, wrote the first Konkani grammar and died there in 1619. Among other works, he was the author of a Konkani paraphrase of the New Testament in metrical form. See also INDO-ARYAN LANGUAGES.

Grierson, *Linguistic Survey of India*, vol. vii (1905). (ET. B.)

MARATHON, BATTLE OF, was fought in Sept. 490 B.C. in northeastern Attica on the plain, about 2 mi. wide and 5 mi. long, between Marathon village and the sea. The Persian fleet, based on Eretria (see GRECO-PERSIAN WARS), landed a strong force of cavalry, infantry and archers on the southern part of the beach. At Athens the people decided, on Miltiades' proposal, to send 9,000–10,000 heavy-armed infantry to Marathon, while other forces defended their walled city. They also sent a runner, Philippides or Pheidippides, to Sparta. He returned next day to report that the Spartans would only leave at the end of a religious festival in six days' time. Meanwhile the Athenians, reinforced by 1,000 Plataeans, held the lowest foothills facing the Persian position.

The Athenian command was headed by Callimachus, a civil official (polemarch). He presided over ten generals who, according to Herodotus, took operational command for one day each.

Of these, five wished to await the Spartans and five to attack if a chance arose. Callimachus decided in favour of the latter, headed by Miltiades (*q.v.*), to whom his four supporters gave their days of operational command. The Athenian infantry could not face the Persian cavalry in the plain, but they narrowed their distance from the enemy by felling trees at night and moving them as obstacles into the plain. The Persians remained on the defensive, expecting the impetuous Greeks to attack and be outflanked by the Persian cavalry.

Shortly before dawn some Ionians serving with Persia came to the Greeks at the felled trees and reported "the cavalry are away." Miltiades saw his chance. He thinned the centre and strengthened the wings of his infantry line, charged at dawn a mile across the plain and struck the Persian infantry with strong momentum. Although considerably outnumbered, the Greek infantry had longer spears and swords and heavier protective armour of bronze than the Persians, who wore turban, tunic and trousers and carried wicker shields. The Greek wings defeated their opponents and wheeled inward. Meanwhile the Persian centre drove the Greek centre backward, but as the Greek wings wheeled they outflanked and defeated the Persian centre at a point which is still marked by a high mound, covering the ashes of the Greek dead. The Greeks pursued vigorously, but the Persian fleet came inshore and rescued the fugitives. As it put out to sea, a message was flashed to it by shield signal from the hills, presumably by a Greek traitor. Turning, the fleet sailed for Athens. Most of the Athenian army marched rapidly to Athens and arrived in time to contest any landing. The Persians departed, having lost 6,400 men as compared with 192 Athenian dead.

Many points are disputed. No one knows why the cavalry were absent. Perhaps the horses were delayed when being watered at the springs in the northern plain.

MARATHON RACE, a modern road race first staged at the revival of the Olympic games at Athens, Greece, in 1896. It commemorates the legendary feat of a Greek soldier, who in 490 B.C. is supposed to have run from Marathon to Athens, a distance of 22 mi. 1,470 yd., to bring news of his countrymen's victory over the Persians.

Michel Bréal of the Sorbonne at Paris originated the idea that the commemorative race should be added to the Olympic games program and, appropriately, the first marathon winner was a Greek, Spyros Louis.

Not until 1924 was the Olympic marathon distance standardized at 26 mi. 385 yd. The distance of the first race at the 1896 Olympics was 24 mi. 1,500 yd. At Paris (1900) the distance was 40 km. (24.85 mi.); at St. Louis, Mo., (1904), 40 km.; at the 1906 unofficial Olympic games at Athens, 26 mi.; at London (1908), 26 mi. 385 yd.; at Stockholm (1912), 24 mi. 1,725 yd.; at Antwerp (1920), 26 mi. 990 yd.; at Paris (1924), 26 mi. 385 yd. From 1924 on each succeeding Olympic marathon was run over a 26 mi. 385 yd. course. The reason for the additional 385 yd. in 1908 was that the British Olympic committee decided to start the race from the royal residence at Windsor castle and finish in front of the royal box in the stadium at London.

Because marathon courses are not standardized, the International Amateur Athletic federation does not list a world's record for the event. Except for the Olympic games championship, perhaps the most coveted honour in marathon running is victory in the Boston (Mass.) Athletic association race, held annually after 1897. Athletes from all parts of the world have participated. For a period of 11 years (1945–56) the winners were exclusively from nations other than the United States; they represented Greece, Korea, Canada, Sweden, Japan, Guatemala and Finland.

The South African Comrades' marathon is run over a 54 mi. 1,100 yd. course. One year the race is from Durban to Pieter-

maritzburg, the next from Pietermaritzburg to Durban. When the race starts from Durban, the course is uphill to an elevation of 3,000 ft. in the first 18 mi., and there is a rise of 500 ft. in 1 mi. near the end of the course. It was in this race that Arthur F. H. Newton, one of the most remarkable all-time distance runners, won his first success. In 1922, at the age of 39 and with no previous athletic experience, he won this endurance run from 87 other runners. In 1925, when 42, he ran the course in 6 hr. 14 min. 30 sec. Indoors, at Hamilton, Ont., in 1931, Newton ran 152 mi. 540 yd. in 24 hr. At the age of 51, he ran 100 mi. on the Bath-to-London road in 14 hr. 7 min. 10 sec.

Another example of the fact that in the marathon road race older runners have a chance for victory was Clarence De Mar of the U.S. who won the Boston Athletic association marathon for the seventh time in 1930. He began road racing in 1909 against the advice of his physician, who predicted he would die of heart disease, but De Mar outlived the doctor. In 1951 when 63 De Mar started and finished in his 1,000th road race.

Because so many races of this type were won by veterans, it was believed that a younger runner would not have a chance in a major event. However, in 1951 Shigeki Tanaka, a 19-year-old Japanese boy, won the Boston Athletic association marathon in 2 hr. 27 min. 45 sec.

In the matter of preparation for a 26 mi. 385 yd. road race it is considered necessary to train over that distance. At the 1952 Olympic games, however, Czech Emil Zatopek set an Olympic record of 2 hr. 23 min. 3.2 sec., even though he had never run the distance before, his only training being in preparation for his victories in the 5,000- and 10,000-m. races. Zatopek's record was broken in 1960 by Ethiopian Bikila Abebe, who covered the distance, barefooted, in 2 hr. 15 min. 16.2 sec.

MARATTI (MARATTA), CARLO (1625–1713), Italian painter who became one of the two leading painters of the Roman school in the later 17th century (the other being G. B. Gaulli). He was born on May 13, 1625, at Cammerino in the Marches. He went early to Rome where he studied under Andrea Sacchi. His reputation was established with his first public work, the "Nativity" (1650, S. Giuseppe dei Falegnami, Rome). A few years later he was noticed by Pope Alexander VII, and thereafter he secured an almost uninterrupted series of important commissions for altarpieces in Italian churches. Among these are "The Mystery of the Trinity Revealed to St. Augustine" (c. 1655, Sta. Maria dei Sette Dolori), "The Appearance of the Virgin to St. Philip Neri" (c. 1675, Palazzo Pitti, Florence), and "The Virgin With St. Charles Borromeus and Ignatius" (c. 1685, Sta. Maria in Vallicella). He also executed a number of decorative ceiling frescoes in Roman palaces, and he was the most distinguished portrait painter in Italy during this period. His portraits include "Pope Clement IX" (Hermitage, Leningrad) and several of visiting Englishmen.

Maratti's early work shows the influence of Sacchi, through whom he learned to admire chiefly the art of Annibale Carracci and Raphael. Thus he became a convinced advocate of classicism at least in theory, in opposition to the baroque painters, Pietro da Cortona, Gaulli and Padre Pozzo. But Maratti was only partly a classicist in practice. His work shows to the full the baroque quality of magnificence, and he was wholeheartedly engaged in the task of representing with the utmost splendour the dogmas of the Counter-Reformation. Maratti died in Rome on Dec. 15, 1713.

MARAZION, a small seaport and seaside resort in Mount's Penwith rural district of Cornwall, Eng., on the shore of Mount's bay, 13 mi. E.S.E. of Land's End by road. Pop. (1961) 1,352. A causeway of boulders and pebbles passable at low tide links the township with St. Michael's Mount (*q.v.*). It has an ancient reputation as a market town and its name is probably derived

from the Cornish words *marchas* ("market") and *bichan* ("small"). A charter of incorporation was granted by Elizabeth I to Marazion in 1595 but borough privileges were lost in the time of Edward VI because of the troubles of the religious rebellion. Marazion owed its former prosperity to the throng of pilgrims who came to visit St. Michael's Mount. It is now a quiet town in surroundings of much beauty. Market gardening is extensively carried on and there is a fishing industry. The inscribed stones in the churchyard of St. Hilary, 1 mi. distant, date from the 4th century, one being in honour of Constantine the Great.

MARBECK (MERBECKE), JOHN (c. 1505–c. 1585), English composer, organist and author, known for his setting of the Anglican liturgy. Some recently discovered evidence suggests the acceptance of c. 1505 as the date of his birth, rather than c. 1510 as has been heretofore assumed. Marbeck was apparently in Windsor in 1531 and, as far as is known, remained there throughout his life. His name appears in the records of St. George's chapel, Windsor, as organist (1541–42). In 1544 he was sentenced to the stake for heresy but was pardoned through the intervention of Bishop Gardiner of Winchester. At that time his "greate worke," his English *Concordance* to the Bible, was taken from him and destroyed. On his release he began it again and, under Edward VI, it achieved publication in an abbreviated form in 1550; in the same year his most famous musical accomplishment, *The Book of Common Prayer Noted* (i.e., set to musical notes), was printed. This setting of the liturgy was superseded by the revisions of 1552, but interest in it was revived by the Oxford Movement in the 19th century. By that time, however, the traditional context of Marbeck's work had been lost.

During the last ten years of his life Marbeck published six books on religious subjects that show an uncompromising dedication to the principles of the Calvinist Reformation. Of his music, only three Latin compositions survive complete: a Mass, *Per arma iustitiae*, an antiphon and a carol. These, together with an antiphon lacking the tenor part, were published in vol. x of *Tudor Church Music* (1929). *The Book of Common Prayer Noted*, together with Cranmer's *First Litany* (1544), has been issued in a facsimile edition, edited by J. Eric Hunt (1939).

See Robert Stevenson, "John Marbeck's 'Noted Booke' of 1550," *The Musical Quarterly*, xxxviii (1951); R. R. Terry, "John Merbecke," *A Forgotten Psalter and Other Essays* (1929).

MARBLE, a metamorphic rock used in many classic sculptures and buildings. Technically, the term (from the Greek *mar-maros*, "stone," or "boulder") is restricted to granular limestones and dolomites that have been recrystallized under the influence of heat, pressure and aqueous solutions in metamorphic environments (see **METAMORPHISM**); commercially, it includes all decorative calcareous rocks that can be polished, as well as certain serpentines (verd antiques).

Marbles in the petrographic sense are massive and consist of a mosaic of calcite grains which under the microscope rarely show any traces of crystalline form but are traversed by minute cracks appropriate to the rhombohedral cleavage of calcite. Particularly in the more severely deformed rocks, the grains show stripes indicating polysynthetic twinning and may be elongated perceptibly in a particular direction or even crushed.

These marbles occur very often interbedded with mica schists, phyllites, gneisses and granulites, and are commonest in the older Paleozoic and pre-Cambrian layers of the earth's crust which have been deeply buried in regions of extreme folding and igneous intrusion such as the Appalachian belt of the eastern United States. The passage of limestones rich in fossils into true marbles as they approach such metamorphic regions is a common phenomenon; occasionally the recrystallization of the rock has not completely obliterated the organic structures; e.g., at Carrara, Italy, and at Bergen, Norway.

Most of the white and gray marbles of Alabama, Georgia and western New England and that from Yule, Colo., are recrystallized rocks, as are a number of Greek and Italian statuary marbles famous from antiquity which are still quarried. These include the Parian marble, the Pentelic marble of Attica in which Phidias,

Praxiteles and other Greek sculptors executed their principal works and the snow-white Carrara marble used by Michelangelo and Antonio Canova favoured by modern sculptors. The exterior of the National Gallery of Art in Washington, D.C., is of Tennessee marble, and the Lincoln memorial contains marbles from Yule, Colo., Alabama (roof transparencies) and Georgia (Lincoln statue).

Even the purest of the metamorphic marbles, such as that from Carrara, contain some accessory minerals, and in many they form a considerable proportion of the mass. The commonest are quartz in small rounded grains, scales of colourless or pale yellow mica (muscovite and phlogopite), dark shining flakes of graphite, iron oxides and small crystals of pyrite.

Many marbles contain other minerals which are usually silicates of lime or magnesia. Diopside is very frequent and may be white or pale green; white bladed tremolite and pale green actinolite are found; the feldspar encountered may be a potassic variety, but is more commonly a plagioclase such as albite, labradorite or anorthite. Scapolite, various kinds of garnet, vesuvianite, spinel, forsterite, periclase, brucite, talc, zoisite, wollastonite, chlorite, tourmaline, epidote, chondrodite, biotite, sphene and apatite may be mentioned as possible accessory minerals. Pyrrhotite, sphalerite and chalcopyrite may also be present in small amounts.

These minerals represent impurities in the original limestone which reacted during metamorphism to form new compounds. The alumina represents an admixture of clay; the silicates derive their silica from quartz and from clay; the iron came from limonite, hematite or pyrite in the original sedimentary rock. In some cases the original bedding of the calcareous sediments can be detected by mineral banding in the marble. The silicates, if present in any considerable amount, may colour the marble; e.g., green from green pyroxenes and amphiboles, brown from garnet and vesuvianite, yellow from epidote, chondrodite and sphene. Black and gray colours result from the presence of fine scales of graphite.

Bands of calc-silicate rock may alternate with bands of marble, or form nodules and patches, sometimes producing interesting decorative effects, but these rocks are particularly difficult to finish because of the great difference in hardness between the silicates and carbonate minerals.

Later physical deformation and chemical decomposition of the metamorphic marbles often produces attractive coloured and variegated varieties. Decomposition yields hematite, brown limonite, pale green talc and, in particular, the green or yellow serpentine derived from forsterite and diopside which is characteristic of the ophicalcites or verd antiques. Earth movements may shatter the rocks, producing fissures afterward filled with veins of calcite; in this way the beautiful brecciated or veined marbles are produced. Sometimes the broken fragments are rolled and rounded by the flow of marble under pressure, and pseudoconglomerates result.

The so-called onyx marbles consist of concentric zones of calcite or aragonite deposited from cold-water solutions in caves and crevices and around the exits of springs. They are, strictly speaking, neither marble nor onyx, for true onyx is a banded chalcedony composed largely of silicon dioxide. Onyx marble was the "alabaster" of the ancients, a source of confusion since alabaster now is defined as a calcium sulfate rock (see **GYPsum**). These marbles are usually brown or yellow due to the presence of iron oxide.

Well-known examples include the *giallo antico* ("antique yellow marble") of the Italian antiquaries, the reddish-mottled Siena marble from Tuscany, the large Mexican deposits at Tégali near Mexico City and at El Marmol, Calif., and the Algerian onyx marble used in the buildings of Carthage and Rome and rediscovered near Oued-Abdallah in 1849.

Unmetamorphosed limestones showing interesting colour contrasts or fossil remains are used extensively for architectural purposes. The Paleozoic rocks of Great Britain, for example, include "madrepore marbles" rich in fossil corals and "encrinital marble" containing crinoid stem and arm plates with characteristic circular cross sections. The shelly limestones of the Purbeck forma-

tion and the Sussex marble, of Mesozoic age, consist of masses of shells of fresh water snails embedded in blue, gray or greenish limestone. They were a favourite material of medieval architects and may be seen in Westminster Abbey and a number of English cathedrals. Black limestones containing bituminous matter, which commonly emit a fetid odor when struck, are widely used; the well known *petit granit* of Belgium is a black marble containing crinoid stem plates.

Uses.—Marbles are used principally for buildings and monuments, interior decoration, statuary, table tops and novelties. Colour and appearance are the most important qualities overall. Resistance to abrasion, which is a function of cohesion between grains as well as the hardness of the component minerals, is important for floor and stair treads. The ability to transmit light is important for statuary marble, which owes its luster to light penetrating from $\frac{1}{2}$ to $1\frac{1}{2}$ in. and being reflected at the surfaces of deeper-lying crystals. Brecciated, coloured marbles, onyx marble and verd antique are used principally for interior decoration and for novelties. Statuary marble, the most valuable variety, must be pure white and uniform in grain size. For endurance in exterior use marble should be uniform and nonporous to prevent the entrance of water that might discolour the stone or cause disintegration by freezing, and it should be free from impurities such as pyrite that might lead to staining on weathering. Calcite marbles exposed to atmospheric moisture made acid by carbon dioxide and sulfurous and other gases maintain a relatively smooth surface during weathering, but dolomite limestone may weather with an irregular, sandy surface from which the dolomite crystals stand out.

The principal mineral in marbles is calcite (*q.v.*); the fact that calcite varies in hardness, light transmission and other properties in various directions has a number of practical consequences in the preparation of some marbles. Calcite crystals transmit more light in one direction than in others, so that slabs prepared for uses in which translucency is significant are cut parallel to that direction. The bending of marble slabs has been attributed to the directional thermal expansion of calcite crystals on heating. The basal faces of calcite crystals are less rapidly soluble than those at right angles; a number of marble tombstones from the 1800s, cut so as to expose the basal faces, have withstood weathering better than those not so prepared.

Quarrying.—The use of explosives in the quarrying of marble is very limited because of the danger of shattering the rock. Instead, channeling machines utilizing chisel-edged steel bars make cuts about two inches wide and several feet deep. Wherever possible, advantage is taken of natural joints already present in the rock, and cuts are made in the direction of easiest splitting ("rift" or "grain"), which is a consequence of the parallel elongation of platy or fibrous minerals. The marble blocks outlined by joints and cuts are separated by driving wedges in drill holes. Mill sawing into slabs is done with sets of parallel iron blades which move back and forth and are fed by sand and water. The marble may be machined with lathes and carborundum wheels, and is then polished with increasingly finer grades of abrasive. (See also QUARRYING.)

Even with the most careful quarrying and manufacturing methods, at least half of the total output of marble is waste. Some of this material is made into chips for terrazzo flooring and stucco wall finish. It is in various localities put to most of the major uses for which high-calcium limestone is suitable (see LIMESTONE).

MARBLEHEAD, a town of Essex county, Mass., U.S., is located 17 mi. N.E. of Boston. Built upon a rocky promontory,

the town has narrow, twisted, hilly streets and a character of quaint charm. Among its historic buildings are the Jeremiah Lee mansion (1768), St. Michael's church (Episcopalian; 1714), the Old Brig (c. 1720), the Old Tavern (1680) and the Elbridge Gerry house.

Marblehead, originally part of Salem, was first settled in 1629 by a group of rugged fishermen from the Channel Islands and Cornwall, Eng. The village was known for its unruliness and disinclination to abide by many of the laws of the Puritan colony. It was incorporated as a separate town in 1649 and in the colonial period was an important commercial, fishing and shipbuilding port. After the passage of the Boston Port act (1774), it was made the port of entry in place of Boston, but its merchants invited the Boston merchants to use their wharves and warehouses. During the American Revolution many vessels set out from this port, the most famous being the "Lee," commanded by John Manley, which in Nov. 1775 captured the "Nancy," with a valuable and much needed cargo of military stores. The schooner "Hannah," manned and fitted there, was the first American warship regularly commissioned (Sept. 2, 1775, by Gen. George Washington) by authority derived from the continental congress. The port declined in importance after the War of 1812 and in the 19th century Marblehead turned to the manufacture of shoes, rope and cordage. The harbour, formed by a rocky peninsula known as Marblehead Neck, provides safe anchorage for craft of all kinds and has become a noted yachting centre. Marblehead is a suburban, residential and resort town. Manufactures include boats and marine equipment. For comparative population figures see table in MASSACHUSETTS: *Population*. (L. G. BA.)

MARBLES: see CHILDREN'S GAMES AND SPORTS.

MARBOT, JEAN BAPTISTE ANTOINE MARCEL-LIN, BARON DE (1782–1854), French general, author of memoirs on the Napoleonic period, was born at La Rivière, a château near Altilac, on Aug. 18, 1782. His father, Antoine Marbot, a landowner, was a general in the French Revolutionary Wars from 1793 and died during the defense of Genoa in 1800. The young Marbot was aide-de-camp successively to Pierre Augereau (at Jena and at Eylau in 1807), Jean Lannes (in Spain and at Essling in 1808) and André Masséna (at Wagram and in Portugal in 1809). Promoted major and then colonel of Belgian light cavalry in 1812, he fought in the battles on the Dvina and Berezina rivers in Russia (1812) and on the Katzbach in Silesia (1813). He was wounded by an arrow in the battle of Leipzig. Colonel of hussars in 1815, he was promoted general by Napoleon on the eve of Waterloo.

In exile after Waterloo, Marbot returned to France in 1819. His *Remarques critiques* (1820) on Gen. Joseph Rogniat's treatise on war admirably set out the human factors of war in contrast with Rogniat's pure theory. Napoleon read the book in St. Helena and in his will left Marbot a legacy to encourage him to write more. A work on the new French army followed in 1826. The influence of the house of Bourbon-Orléans brought Marbot back to service in 1829; and when Louis Philippe became king in 1830 he chose Marbot to be aide-de-camp to Ferdinand, duc d'Orléans. They were at the siege of Antwerp and served together in Algeria.

Marbot died in Paris on Nov. 16, 1854. His *Mémoires*, written for his children, were not published until 1891 (Eng. trans. 1892). More than any other work they revived interest in the incidents and personalities of the first empire. Their inaccuracy, however, is only too evident, and many of the exploits that Marbot brilliantly recounts are known to be fiction. (I. D. E.)

MARBURG (MARBURG AN DER LAHN), a university town of Germany which after partition of the nation following World War II was in the *Land* (state) of Hesse, Federal Republic of Germany. It is situated on the Lahn river, 96.6 km. (60 mi.) N of Frankfurt am Main by rail. Pop. (1961) 44,853.

The name Marburg was first mentioned in 1130 and according to tradition the town gained civic rights in 1211. Marburg's oldest church, the Kilian (used for administrative offices), Romanesque in style, dates from that period. The Philipps-Universität, founded in 1527, was Europe's first Protestant university.

Onyx marble quarried near Sulsun City, Calif.

White marble from Carrara, Italy

Fossiliferous marble. The fossils are corals, stromatopores and bryozoans. Fernbrook, New South Wales, Australia

Rose garnet marble quarried near Xalostoc, Mexico

Brecciated marble from Siena, Italy

Marble breccia from Portugal

Verdoso marble from West Rutland, Vt.

The early history of Marburg is associated with St. Elizabeth (*q.v.*), who went from the Wartburg to Marburg in 1228 and spent the rest of her life there in charitable works. Her bones are preserved in a golden shrine, a masterpiece of the Rhenish goldsmiths' craft, in the church of St. Elizabeth, completed in 1335. Above the Lahn rises the castle of the landgraves, the cradle of the Land of Hesse. The first part of the castle (the knights' chamber and the chapel) was begun in 1277 and the last part (the east wing) was completed in 1493. In 1529 Philip the Magnanimous summoned Luther and Zwingli and other Protestant reformers to the castle for the Marburg disputations (*see* MARBURG, COLLOQUY OF). Marburg has the Staatsbibliothek, one of the most important libraries in the Federal Republic. The Central Research Institute for German is associated with the university.

The town's economy rests on the university and tourist traffic and also a number of industries in applied arts, one of the most important being the Marburg art potteries. Marburg is a popular conference town; about 100 conferences and exhibitions take place yearly. The town is surrounded by woods and the old town affords many subjects of interest.

Marburg's open-air theatre in the castle grounds is dominated by a triad of Gothic arches, and in that setting German and other classics are produced annually. (B. St.)

MARBURG, COLLOQUY OF, the name given to a debate on the Eucharist (*q.v.*), held on Oct. 1-4, 1529, at Marburg, Ger., between the Reformers of Germany and Switzerland, which had far-reaching consequences for the history of the Reformation.

A majority resolution against the Reformation by the second diet of Speyer in April 1529 (*see* REFORMATION: *German and Swiss Reformers*) caused the "Protestation" by 19 German territories and prompted the landgrave Philip (*q.v.*) of Hesse to organize a federation of the "Protestants" which was to include also some Swiss cantons. Since the Lutherans had always insisted on a common confession as the basis of a federation, the landgrave revived his plan of a colloquy as a means of settling the controversy on the Eucharist which since 1524 had been dividing the adherents of the Reformation. The colloquy, summoned for Michaelmas at Marburg, was "a political action" (Walther Köhler), caused by the perils threatening the Reformation, prepared and accompanied by diplomatic negotiations between the landgrave and the participant states (mainly Saxony, Strasbourg, Zürich, Basel).

Preliminary discussions on Friday, Oct. 1, between Martin Luther and John Oecolampadius, Huldreich Zwingli and Philipp Melancthon, the four colloquists, preceded the colloquy proper, which was held in four sessions from Saturday morning to Sunday afternoon in the presence of the landgrave Philip, Duke Ulrich of Württemberg, the delegates from the participant territories and up to 60 guests. The point at issue was the meaning of the words of Christ: "This is my body." Luther defended the traditional, Catholic, literal understanding against the spiritualizing interpretation by a humanistic Protestantism which was unable to accept the idea that in the sacrament the true, essential body of Christ is received orally. This was a genuine "contention of faith" between two concepts of the divine revelation in Christ, which according to Luther and Zwingli excluded one another, while Martin Bucer, who as a member of the delegation from Strasbourg spoke at the end of the colloquy, believed that they could be reconciled.

The colloquy was, despite some tense moments, dignified and Christian. After its breakdown on Sunday, Oct. 3, the landgrave, who wanted some tangible result, asked Luther to formulate what agreement existed between the parties. Accordingly, on the following day Luther composed the 15 articles of Marburg, on the basis of articles agreed upon at Wittenberg before the departure for Marburg (later called Articles of Schwabach). The Articles of Marburg stated what was regarded as the common doctrine of the German and the Swiss Reformation on God, the incarnation, the person of Christ, original sin, atonement, justification and faith, "the external word," baptism, works, "confession or seeking of counsel," secular authority, human traditions, infant baptism and the Lord's Supper. The carefully worded 15th article men-

tions points concerning which there had never been a difference of opinion between the Reformers and which had hardly been touched upon in the colloquy and puts the dissent in the words that "at present we are not agreed as to whether the true body and blood of Christ are bodily present in the bread and wine"—the question that had been the only object of the colloquy. The articles were read, alterations suggested and made, and the final draft signed by the theologians. Since the first 14 articles had not been discussed at the colloquy and the short time available on Monday made any thorough discussion impossible, they should not be regarded as the real result of the Marburg colloquy. But they provided Philip of Hesse with the syncretism he had wanted for the Protestant cause. Both these articles and those of Schwabach were in 1530 partially embodied in the Augsburg Confession (*q.v.*).

MARC, FRANZ (1880-1916), German painter, one of the leaders of the "Blue Rider" Expressionist movement, was born in Munich on Feb. 8, 1880. His father was a minor landscape and genre painter. Marc studied at the Munich academy under Wilhelm Diez. A trip to Paris in 1903 brought him into contact with Impressionism, while the Art Nouveau movement in Munich made him conscious of the problems of formal structure. Perhaps the strongest influence on his early work was Van Gogh, but he did not fulfill the potentialities of his genius until he discovered the nonobjective paintings of Wassily Kandinsky (*q.v.*) with their pure colour and form. In 1911 he and Kandinsky edited the book *Der Blaue Reiter*, one of the great documents of modern art. The almanac also gave its name to a significant movement in Expressionism: the "Blue Rider." Whereas Kandinsky renounced the objective, Marc was drawn to nature, especially the animal motif, in which he sought a pantheist empathy with the vibrations and rhythms of nature. In 1913 and 1914 he created his most important paintings, "The Tower of Blue Horses," the "Fate of the Beasts" and "The Unhappy Tyrol." Influenced by non-objectivity, Cubism and Futurism, he worked with sonorous colours and crystalline forms which interpenetrate to create an organic harmony. He used colour and form to dismantle the material and the objective and to help create the world of the spirit. Finally, he painted a series of entirely nonobjective paintings. In 1914 Marc joined the German army; he was killed near Verdun on March 4, 1916.

MARCANTONIO (MARCANTONIO RAIMONDI): *see* RAIMONDI, MARCANTONIO.

MARCASITE, a mineral with the same chemical composition as pyrite, being iron disulfide, FeS₂, but crystallizing in the orthorhombic instead of the cubic system. Apart from crystalline form, the appearance and physical characteristics of marcasite (sometimes known as white iron pyrite) are very similar to those of pyrite, and in the absence of distinct crystals it is difficult to distinguish between the two species. The colour is pale bronze-yellow; on freshly fractured surfaces the colour is tin-white, but this rapidly tarnishes on exposure to air. The lustre is metallic and brilliant; the streak is greyish black; the hardness is 6 to 6.5; the specific gravity is 4.89. In the course of time, specimens of marcasite usually disintegrate, forming ferrous sulfate and sulfuric acid. In nature marcasite is frequently altered to hydrated iron oxide, goethite (*q.v.*) or limonite (*q.v.*). Under weathering conditions it is less stable than pyrite.

Distinctly developed single crystals of marcasite are rare; more often crystal aggregates occur twinned on a prism plane producing pentagonal stellate groups of fine crystals. This frequent twinning gives rise to characteristic forms, with many re-entrant angles, to which the names "spear pyrites" and "cockscomb pyrites" are applied. The commonest state of aggregation is that of

and the author's own views on the subject, and the book is a valuable contribution to the literature of the subject.

The book is written in a clear and concise style, and is well illustrated with numerous examples and diagrams. It is a valuable reference work for all those concerned with the study of the subject, and is also a useful text book for students of the subject.

dukes of Richmond and Lennox (*see* RICHMOND, EARLS AND DUKES OF), in whose family it has since remained, being used as a courtesy title for the eldest son of the family during his father's lifetime. This English peerage must be carefully distinguished from the Scottish earldom of March.

Scottish Earls.—The Scottish earls of March were descended from CRINAN, father of Duncan, king of Scotland from 1030 to 1040, who was murdered by Macbeth. MALDRED, another son of Crinan, married Ealdgyth, daughter of Uhtred, earl of Northumberland, and of Elgiva, daughter of the Anglo-Saxon king Aethelred II. Maldred's son COSPATRIC or GOSPATRIC (d. c. 1075) was made earl of Northumberland (1067) by William the Conqueror, but he was deprived of this position (1072) and fled to Scotland where his cousin Malcolm III granted him Dunbar and adjoining lands. His son COSPATRIC (d. before Aug. 1139) witnessed the charter of Alexander I founding the abbey of Scone (c. 1115) and was perhaps killed fighting on the Scottish side at the battle of the Standard near Northallerton in Aug. 1138. His son, the third COSPATRIC (d. 1166) left two sons, the younger of whom was the ancestor of the earls of Home. The elder son, WALTHEOF or WALDEVE (d. 1182), was one of the sureties for the carrying out of the treaty of Falaise (Dec. 1174), arranging the release of the Scottish king William the Lion who had been captured by English forces while attacking Alnwick. The name of Dunbar, derived from the family estates, became a hereditary surname in the time of Waltheof's son PATRICK (d. 1232). This Patrick, styled 4th earl of Dunbar, was keeper of Berwick castle and married Ada, King William's illegitimate daughter. His son PATRICK (d. 1248) started out on the 7th crusade but died at Marseilles. His son PATRICK (d. 1289), the 6th earl, supported the Anglophile party in Scottish politics, helping to overthrow the "national" party led by the Comyns in 1255. In the same year he was nominated a guardian of the young king Alexander III.

PATRICK DUNBAR (d. 1308), 7th earl of Dunbar, was the first of his line to be called earl of March. He was referred to as *comes de Marchia* at the Brigham parliament of 1290. He claimed the crown of Scotland in 1291 in right of his great grandmother Ada, but soon withdrew and did fealty (1296) to the English king Edward I. In the subsequent wars he took the English side and was appointed (1298) commander of the English forces south of the Forth.

PATRICK DUNBAR (c. 1285–1368), 8th earl of Dunbar and 2nd earl of March, helped Edward II to escape after the English defeat at Bannockburn (1314) but then joined the Scottish patriots, fighting with them in 1332–33 at the battles of Dupplin and Halidon hill. His countess, known in Scottish history and romance as "Black Agnes," daughter of Thomas Randolph, earl of Moray, conducted a spirited defense of Dunbar castle when it was besieged (1338) by the earl of Salisbury. Both Earl Patrick's sons predeceased him; he therefore resigned his earldom to the crown and it was regranted to his greatnephew and heir male, GEORGE DUNBAR (d. c. 1416–20) who became the 9th earl. He was made warden of the marches (1372), accompanied James, earl of Douglas, on his foray into England and commanded the Scots after Douglas was killed at Otterburn (1388). Having been badly treated by King Robert III, by his son the duke of Rothesay and by the Douglasses, he renounced his allegiance (1400) and fled to England, subsequently fighting on the English side at the battle of Homildon hill (1402). At the battle of Shrewsbury (1403) Dunbar fought against the Percys and Owen Glendower, with whom Douglas was now allied. He was forfeited but returned to Scotland (1409) after the death of Robert III and was restored to his earldom by the regent Albany.

His son GEORGE DUNBAR (d. c. 1455–57), 10th earl of Dunbar and 4th earl of March, was one of the negotiators (1423–24) for the release of James I from captivity in England; Dunbar was knighted at that king's coronation. But on the doubtful ground that the regent had had no power to reverse Patrick Dunbar's forfeiture, James II seized Dunbar castle in 1434 and the earl fled to England. The parliament at Perth (Jan. 1435) declared his lands and titles forfeited to the crown.

The earldom of March, thus forfeited, was conferred (1455) by

James II on his second son ALEXANDER, afterward duke of Albany. But this prince later entered into correspondence with Edward IV of England and the earldom of March and the barony and castle of Dunbar were again (1457) annexed to the crown of Scotland.

The Scottish earldom of March was next held from 1580 to 1586 by ROBERT STEWART, second son of John, 3rd earl of Lennox. By another creation, the title was then conferred (1697) on WILLIAM DOUGLAS, 2nd son of William, 1st duke of Queensberry. Since 1826 the earldom of March has been merged with the earldom of Wemyss. *See* ALBANY, DUKES OF; LENNOX, EARLS AND DUKES OF; QUEENSBERRY, EARLS, MARQUESSSES, AND DUKES OF.

MARCH, AUSIÀS (1397–1459), the greatest poet of the Catalan language, and the most vigorous poetic personality of the 15th century in the Iberian peninsula, was born of a noble family, probably at Gandia, and died at Valencia. As a young man he accompanied Alfonso the Magnanimous of Aragon to Sardinia and Corsica, and took part in the Neapolitan and Sicilian campaigns and in the attack on Djerba in 1424. He retired at 32 to his own estates and at 40 married the first of his two wives, a sister of Joanot Martorell, author of the most important of Catalan novels, *Tirant lo Blanc* (c. 1460).

March's outwardly uneventful life contrasts with his tormented verses, which chronicle the conflict between his sensuality and his passionate idealism, issuing in anguished contempt for the flesh and for his own weakness and that of his mistress, Teresa Bou, in yielding to it. Except for Petrarch, all the formative influences on March's poetry and on his attitude to life—the Provençal troubadours, Scholastic philosophy and the *dolce stil nuovo*—place him as a writer of the middle ages rather than of the Renaissance; his apparent modernity lies in his highly personal expression of his dilemma in starkly abstract verse, almost devoid of imagery, and uncompromising in its intellectual and metaphysical subtlety, except when his implacably analytical probing into his own nature yields to an outburst of despair and self-loathing.

March's poems are by convention divided into *Cants d'amor* and *Cants de mort* (respectively before and after his mistress' death), *Cants morals*, and the great *Cant espiritual*, in which he at last attains to a measure of serenity in the face of death. His influence on the Castilian poetry of the golden age was as great as that of his Castilian predecessors on his own work had been negligible.

March et ses prédécesseurs* (1912) and *Commentaire des poésies d'A. March* (1925); M. de Riquer, *Traducciones castellanas de A. March en la Edad de Oro* (1946) (F. S. R.).

MARCH, FRANCIS ANDREW (1825–1911), U.S. philologist, lexicographer and educator, whose special field of study was the English language, was born on Oct. 25, 1825, in Milbury, Mass. He graduated in 1845 from Amherst college where his attention was turned to the study of Anglo-Saxon by Noah Webster. After teaching in secondary schools and at Amherst, he went in 1855 as a tutor to Lafayette college, Easton, Pa., where in 1857 he became professor of English language and comparative philology—the first chair of the kind established. In 1907 he became professor emeritus.

In 1865 he published *Method of Philological Study of the English Language*, and in 1870 *A Comparative Grammar of the Anglo-Saxon Language*, a monumental work, and *An Anglo-Saxon Reader*, both marking a new era in the study of English in America. To the "Douglass Series of Christian Greek and Latin Classics," which he edited, he contributed *Latin Hymns* (1874). In 1879–82 March was director of the American readers for the Philological Society's *New English Dictionary*. His article "On Recent Discussions of Grimm's Law" in the *Transactions and Proceedings* of the American Philological association for 1873 in large part anticipated Verner's law. With his son, Francis Andrew March (1863–1928), who was also a professor at Lafayette and a noted lexicographer, he edited *A Thesaurus Dictionary of the English Language* (1903). March died in Easton on Sept. 9, 1911. Peyton Conway March (q.v.) was also his son.

MARCH, PEYTON CONWAY (1864–1955), U.S. army officer who served as army chief of staff, 1918–21, was born at Easton, Pa., on Dec. 27, 1864, and attended that city's Lafayette college, where his father was a professor. After graduation in 1884 he entered the U.S. Military academy at West Point, N.Y., graduating in the class of 1888. March served in the Philippines during the Spanish-American War as an artillery officer. From 1903 to 1907 he served on the army general staff and was for a short time stationed in Manchuria as an observer of the Russo-Japanese War. During World War I he was put in charge of U.S. artillery forces in France and in May 1918 was named chief of staff, U.S. army, with the rank of general. In this position he had to deal with many difficult problems of army organization, training and demobilization. He retired from active duty on Nov. 1, 1921.

March received many decorations and awards from his own and other countries; in 1953 congress passed a joint resolution of thanks for his military services to the nation. He died in Washington, D.C., on April 13, 1955.

See Peyton C. March, *The Nation at War* (1932).

MARCH (Lat. *Martius*), the third month of the modern calendar, has 31 days. According to tradition the earliest Roman calendar, ascribed to Romulus, had only ten named months, March through December, the "dead season" of midwinter being left undesignated; to these ten January and February were later added by Numa Pompilius. Though the historical evidence for these early calendars is disputed, it is clear, if only from the names of the numbered months (e.g. December, "tenth month"), that March was originally the first month, the starting point for the annual cycle of religious festivals. It was only in or after 153 B.C., when Jan. 1 was finally fixed as the date for new magistrates to take office, that the civil calendar prevailed over the religious, and January thus came to be regarded as the first month. Since early spring was the season for renewed activity both in agriculture and in warfare, March was appropriately named for the god Mars, who seems to have been originally both a god of war and the protector of vegetation. (See also **CALENDAR: Western Calendar**.)

Memorable dates in this month include March 15 ("the Ides of March"), on which Julius Caesar was assassinated, and St. Patrick's day, March 17. Since the Council of Nicaea (A.D. 325) the date of Easter, the chief movable feast of the Christian calendar, has been calculated from the vernal equinox, reckoned as March 21. Until the passage of the 20th amendment to the Constitution presidents of the United States were normally inaugurated on March 4. This amendment, adopted in 1933, modified the provisions of the 12th amendment and set the date for the inauguration on Jan. 20.

(F. R. WN.)

MARCHAND, JEAN BAPTISTE (1863–1934), French general and explorer celebrated for his occupation of Fashoda in 1898, was born at Thoissey, Ain, on Nov. 22, 1863. After four years' service in the marines and at the military school of St. Maixent, he was commissioned sublieutenant in 1887. On active service in Senegal in 1889, when he was twice wounded, he was made a chevalier of the Legion of Honour. Appointed captain in 1892, he took part in expeditions to the western Sudan and to the hinterland of the Ivory Coast from 1893 to 1895. He was then entrusted by the French government with the task of crossing Africa from the west to the White Nile at Fashoda (Kodok), in order to prevent the British from linking Egypt to Uganda. Marchand left Brazzaville in Jan. 1897 with a small force and reached Fashoda in July 1898. The Fashoda crisis between Great Britain and France ensued (see **EGYPT: History**). He was subsequently promoted commander of the Legion of Honour.

After the outbreak of the Boxer rebellion in China in 1900, Marchand joined the French expeditionary force in Peking, of which he became chief of staff. He resigned from the army in 1904 with the rank of lieutenant colonel. Recalled to active service in World War I, he rose to be general of division (April 1917). He retired again from the army in 1919, receiving the grand cross of the Legion of Honour. Marchand died in Paris on Jan. 13, 1934.

See J. Delebecque, *Vie du général Marchand* (1936).

MARCHAND, JEAN HIPPOLYTE (1883–1941), French painter, was born in Paris on Nov. 22, 1883. He studied with Leon Bonnat and Luc Merson (1902–06), but deserted conventional styles, and exhibited at the Salon des Indépendants in 1908. He visited Russia and England on several occasions. Though Marchand came under the influence of Cubism between 1910 and 1912, his work was not greatly affected by it. His human forms are treated with power and discretion, while his landscapes and still life are tinged with an intense melancholy. He died in Paris on Oct. 10, 1941.

MARCHE (La MARCHE), a province of France under the ancien régime, bounded in its ultimate form by Limousin in the south and southwest, by Poitou in the west, by Berry in the north, by Bourbonnais in the northeast and by Auvergne in the southeast, so that it corresponded, in terms of modern départements, to most of Creuse with a small fragment of Indre and much of northern Haute-Vienne (q.v.).

In ancient times the country was part of Limousin (q.v.), from which it was detached in the middle of the 10th century to form a separate frontier countship, march or mark, to protect Poitou and the rest of the duchy of Aquitaine against invasion, whether by the French king's troops from Berry or by Norman raiders from the Loire valley. The first count, Boso the Old (recorded in 944), belonged to the Poitevin house of Charroux, but his direct male line died out in 1091, and the countship then passed to the house of Montgommery, which sold it in 1177 to Henry II of England. Henry's son John gave it to Hugh IX of Lusignan in 1199 (see **LUSIGNAN**). After the death of Hugh XIII of Lusignan (1303), the countship was confiscated by the French king Philip IV in 1308.

Meanwhile the frontiers of the countship had undergone changes. Charroux in the west remained a fief of Poitiers; Bouscay in the northeast was gradually annexed to Berry; Combraille (the country round Chambon) in the east was taken by Auvergne in 1180; and the countship's only major acquisition was the viscounty of Aubusson, in the southeast (c. 1260). Moreover, a chain of fiefs depending directly on Poitiers, interspersed with ecclesiastical lordships, grew up to cut the countship practically into western and eastern halves, Basse Marche and Haute Marche. Basse Marche, on the middle Gartempe river, had Le Dorat and Bellac as its chief towns, Haute Marche, mainly on the Creuse, had Guéret, Ahun and eventually Aubusson.

Philip IV of France gave the countship to his third son, the future Charles IV, as an appanage in 1311 and made it a peerage for him in 1316. Charles in 1327 granted it to Louis I de Bourbon. It was held by a junior line of the Bourbons from 1342 to 1435, by a junior line of the house of Armagnac from 1435 to 1477, then by Pierre II de Bourbon (Pierre de Beaujeu) and by the constable Charles, duc de Bourbon. Confiscated by Francis I of France in 1527, it was granted successively to the widows of the French kings from 1574 to 1643. From the late 17th century to the end of the ancien régime the title was borne by sons of the princes de Conti.

Administratively, Basse Marche was from 1586 under the intendant of Limoges, but Haute Marche was under the intendant of Moulins (Bourbonnais). Judicially, the whole province depended on the parlement of Paris. The manufacture of tapestries at Felletin and at Aubusson dates from the 14th to the 16th centuries.

MARCHES, THE (Italian MARCHE), a region of central Italy, composed of the provinces of Ancona, Ascoli Piceno, Macerata and Pesaro-Urbino. Area 9,692 sq.km. (3,742 sq.mi.). Pop. (1961) 1,310,847. The Marches is a region of mountains and hills, the only pieces of level land being scattered along river valleys and on the Adriatic shore. Its mountain backbone is the Umbrian-Marchigian section of the Apennines; the administrative boundary between the Marches and neighbouring Umbria is the watershed between the Tyrrhenian and Adriatic slopes. The highest peak of the region is Monte Vettore (8,130 ft.). Except for the northernmost part, the hills of Montefeltro, the Marches is characterized by rivers running at right angles to the main Apennine crests out to the Adriatic, separated by low parallel ridges. The most im-

portant of these rivers are the Metauro, the Foglia, the Esino, the Potenza, the Chienti and the Tronto, the last named forming the boundary between the Marches and the Abruzzi. The upper valleys of these streams are narrow, often passing through deep gorges, while the lower sections are wider. The valley bottoms are thoroughly cultivated and most of the lower slopes are either in meadows or in well-tended fields.

The economy of the Marches is predominantly agricultural. Wheat and maize (corn) are the main cereals, and there are vineyards on all the sunny slopes, a white wine produced in the area being especially popular. The local type of cattle, beasts of burden rather than meat or milk producers, are known throughout Italy, and there are large numbers of horses, pigs, sheep and poultry. Fishing is important in several of the Adriatic ports, especially in Ancona and San Benedetto del Tronto. Industries are mostly small or medium sized and include shipbuilding in Ancona, paper in Fabriano, textiles in Iesi, musical instruments in Castelfidardo, pottery in Pesaro and Recanati. Ancona is the largest city and the only one with a natural harbour; Pesaro is the only other urban centre of any size on the seacoast. The other cities are hilltop settlements, like Urbino, Macerata and Ascoli Piceno, or valley centres, like Iesi and Fabriano. The main artery of north-west-southeast travel is the coast railroad, from Bologna through Rimini to Pesaro and Ancona and on to Foggia and Bari. Ancona also has a direct rail line to Rome. There are few secondary railroads, but a good network of roads links all settlements.

The Marches, originally inhabited by the Gauls and the Picenes, were incorporated early into the domain of Rome and became a single administrative unit as early as A.D. 292. During the early middle ages the southern part was ruled by the Lombards; the northern section, the so-called "Five Cities" along the Adriatic (Fano, Pesaro and others), was under the control of the Byzantine exarch of Ravenna. The name of Marches ("border province") appears during the 10th century; shortly afterward numerous "communes" constituted themselves into independent units. With the emergence of such powerful feudal families as the Montefeltro of Urbino and the Malatesta of Pesaro came turbulent times, aggravated by the desire of the popes to include the Marches in their domain. After the decline of the feudal lords, in the latter part of the 16th century, the Marches became part of the papal states, and remained thus until their incorporation in the kingdom of Italy in 1860.

(G. Kx.)

MARCHESI, MATHILDE (née MATHILDE GRAUMANN) (1821–1913), German singer and teacher, was born at Frankfurt am Main on March 24, 1821. In 1845 she went to Paris to study with Manuel García. She made her debut as a singer in 1849 but in 1854 began her teaching career. She taught at the conservatories of Vienna and Cologne as well as in London and Paris. In 1852 she married the Italian baritone Salvatore Marchesi, cavaliere de Castrone and marchese della Rajata (1822–1908), who was also a well-known teacher. Marchesi published works on the technique of singing and in 1897 a volume of reminiscences, *Marchesi and Music*. She died in London on Nov. 17, 1913. Her daughter, Blanche Marchesi (1863–1940), was a Wagnerian singer and a teacher. She published *Singer's Pilgrimage* (1923).

MARCIAN (396–457), Eastern Roman emperor 450–457, was born in 396 in Thrace, the son of a soldier. He followed his father's profession, but during the Persian war of 421 he was still a private. He later entered the service of Aspar (q.v.) and fought under him in 431 in Africa, where he became a prisoner of the Vandals. It is said that even at this date Gaiseric, the Vandal king, predicted his future greatness. When Theodosius II died in 450, Marcian had risen high in Aspar's service; and Theodosius' sister Pulcheria, who then chose Marcian as her husband, and Aspar had him appointed emperor on Aug. 25. In foreign policy Marcian was a man of peace, although he adopted a stiffer attitude toward Attila than Theodosius II had done and although there were minor troubles with the Saracens on the eastern frontier. But he refused to become entangled in war with the Vandals in Africa. In religion he was strictly orthodox, and the greatest event of his reign was the meeting of the fourth ecumenical council, which opened at Chalcedon on Oct. 8, 451 (see COUNCIL: Councils to the 9th

Century). In internal affairs Marcian was an energetic administrator. He saved money by refusing to pay tribute to the Huns, and he remitted taxation so far as he could, favouring the wealthier classes by abolishing the *foliis*, the tax on the property of senators. He also confined the expensive office of the praetorship to senators resident in Constantinople. The result was that at his death he left a well-filled treasury, and his reign was looked back upon as a golden age. Marcian died at the beginning of 457, and with him the Theodosian dynasty came to an end. His daughter Euphemia was married to Anthemius (q.v.), later emperor of the west. Marcian's successor was Leo I (q.v.).

MARCION (fl. 2nd century A.D.), the leader of a vigorous heretical movement in early Christianity, the most striking tenet of which was the doctrine of two Gods: one the Creator and Judge, the other the God whom Jesus revealed. Since nothing from Marcion's hand has survived, and any information about him must be derived from the occasional and often biased comments of such orthodox opponents as Tertullian (*Against Marcion*) and St. Epiphanius (*Panarion*), scant knowledge of the man himself is available. Obviously a person of considerable originality and force, he hailed from Sinope (Sinop) in Bithynia-Pontus, where his father is said to have been the Christian bishop. He appears to have become a shipowner and a man of some wealth. His early life is altogether obscure but toward the middle of the 2nd century he emerged as an influential teacher in Rome. It is likely that this activity in the Roman Church followed upon similar activity farther to the east. It has been argued that Polycarp's epistle to the Philippians (c. A.D. 130) reflects the presence and influence of Marcion in Macedonia. Having reached Rome (c. A.D. 137), he was associated for a time with Cerdo, an important Gnostic teacher, and it is possible that some of the features of his thought are to be ascribed to Cerdo's influence. But Marcion was not a true or typical Gnostic despite his dualism and docetism (q.v.). He thought of himself as being a devoted disciple of Paul, who, he claimed, was the only true apostle. Because he looked upon the Jewish Scriptures, which were also at that time the Scriptures of the early church, as belonging to the inferior Creator-God, he repudiated them and set up in their place for his followers a new scripture consisting of a gospel (closely resembling that of Luke) and the Epistles of Paul. He also composed the *Antitheses*, a work in which the law and the Gospel were sharply contrasted. Marcion was a gifted organizer as well as a brilliant and persuasive teacher, and the movement he established became both widespread and powerful. The date of his death is unknown. See also MARCIONITES; GNOSTICISM.

See A. von Harnack, *Marcion: das Evangelium vom fremden Gott* (1921 and 1924). (J. Kx.)

MARCIONITES. Marcion (q.v.) exercised a major influence upon the development of Christianity in the 2nd century, an influence to be seen both in what the church took from him—especially a renewed attention to the writings of St. Paul—and in the measures adopted to oppose what was quickly perceived to be a dangerous perversion of the Gospel. Marcion was not merely an exponent of heresy or the leader of a school of thought verging on Christianity but also a founder of churches that were at first serious rivals to orthodox Christianity and kept themselves in being for centuries.

Marcion's theology centred upon his conviction that Christianity was something wholly new. Unable to reconcile the God revealed in Jesus with the God described in the Old Testament, he severed the Christian revelation from its roots in past history and taught that Jesus had come to reveal the true God, as yet wholly unknown, a God of pure love who had now for the first time acted in the material universe by sending His Son to redeem men from it. The Old Testament was not rejected as untrue; it was revelation of a kind. But the god whom it truly revealed, the god of the Jews, the demiurge (q.v.), was an inferior being who had fashioned the material universe, including man, and ruled it on the principle of law and obedience. He was powerful, but not omnipotent; at best, he was just, at worst, capricious, wrathful and

violent. Although not in himself the principle of evil, he was not the principle of good. The Messiah of the Old Testament was not identified with the Son of the true God. In redeeming men from sin and death, Jesus, the Son of God, was also rescuing them from the demiurge, who would eventually pass away together with his material universe. In all this Marcion was convinced that he had the support of St. Paul, indeed that he alone properly understood the apostle. In Paul he saw, above all else, the antithesis between law—the principle of the demiurge, of the Old Testament and of the Jews—and gospel—the principle of the God of love and of redemption in Jesus. With law went rewards and punishments, justification by works of obedience, while to gospel belong faith, liberty and grace. He also made the most (and more) of Paul's distinction between flesh and spirit. It cannot be doubted that Marcion was genuinely trying to interpret St. Paul; that the contemporary church was showing signs of a legalism contrary to the spirit of Paul and had an inadequate understanding of his profoundest teachings; or that Marcion was honestly facing real problems—in general, the problem of evil, and, in particular, the problem of the character of God as described in the Old Testament. He refused to adopt the method of allegorical exegesis which removed the latter difficulty for most Christians in an age which knew little of biblical criticism or "progressive revelation."

On the other hand, it is equally clear that Marcion perverted the teaching of St. Paul and that his own views had certain other sources. How Marcion's doctrine was related to gnosticism (*q.v.*) has often been a matter of controversy. He was unlike some leading gnostic teachers in that he eschewed all theories of aeons and emanations from God, had no fantastic mythology of redemption and did not so classify men by their natures that salvation was assured to one class and denied to another: for him, salvation was received by faith in Jesus Christ, indeed in Christ crucified. But it seems wrong to distinguish him from the gnostics on the ground that, while they were primarily philosophers, he was essentially religious; for the gnostic systems were normally offered as religions of redemption from evil and death. Marcion's kinship with gnosticism is inescapably evident in his attitude to matter and to the flesh; matter (at least according to his early critics) he treated as the principle of evil, and the flesh, if not intrinsically evil (as he probably believed), was for him unworthy of redemption. Hence his Christology was docetic; Christ had no true human nature (*see* DOCETISM). Though Marcion emphasized the pace of the Cross and of suffering in redemption, it is doubtful whether he could consistently do this. Unlike Paul, he did not wrestle with the reconciliation of love and justice in one God, so that his doctrine of redemption, the core of his teaching, was after all shallow and un-Pauline. The same was probably true of his notion of faith and grace.

Marcion organized his followers into churches outwardly similar to those of the catholic church. They had an episcopal ministry, practised (illogically, his critics said) the sacraments of baptism and the eucharist and lived ascetically, renouncing marriage. Further, they possessed a Bible, the first fixed canon of Christian scriptures. Marcion accepted only St. Luke's Gospel and ten Pauline epistles (*i.e.*, he excluded the Pastorals and Hebrews); and these he mutilated, cutting out anything inconsistent with his own beliefs. Besides furnishing the epistles with prologues, Marcion gave his churches a guide to their interpretation in his *Antitheses*, a book that has not survived but that can be reconstructed in part from Tertullian's *Against Marcion*.

The existence of such churches compelled the catholic church to take Marcion very seriously. After the earlier skirmishers, such as Justin Martyr, Irenaeus attacked him, among the gnostics, in his *Against Heresies* (*c.* 185), as did Tertullian in his longest work, *Against Marcion* (*c.* 207), and elsewhere. It was easy to attack his arbitrary treatment of the text of those books which he himself accepted as Scripture, to press against him the argument from history and prophecy and to assert the necessary unity of the God of creation and redemption, the goodness of matter as God's creation and, therefore, the full reality of Christ's humanity (technically, Marcion's Christology was not only docetic but also modalist, the Son being conceived as no more than a manifesta-

tion of the Father); but also, if the church was to reject the dualism of good and evil (or imperfect) gods or of God and matter as the answer to the problem of evil, it had to develop its alternative solution. Hence the renewed emphasis upon the doctrine of the Fall evident in Irenaeus, Tertullian and Origen. Further, Marcion's misuse of St. Paul had to be countered by an even deeper interpretation of his essential message. This was largely provided by Irenaeus. Tertullian also emphasized the redemption of all creation (including the resurrection of the flesh) and brought out the continuity of sacred history: the good God had not been absent from his creation before the Incarnation. Marcion's canon produced a crystallization of the church's own, with apostolic authority as the criterion. Paul, of course, was accepted, but so were Peter and John. Other Gospels with apostolic authority were set with St. Luke's; and further attention was drawn to the importance of the apostles by the inclusion of Acts. More generally, apostolicity was advanced as a principal mark of the true church in reply to Marcion and to other gnostics who took too little account of history and of tradition or who claimed to have secret revelations of their own. The church appealed to the apostolic writings and to the tradition-preserved in churches of apostolic origin, seen in worship and in the apostolic rule of faith and guarded by the bishops in manifest succession of office in each local church—often, it was believed, from the days of the apostles themselves. Marcion did not create catholicism by causing a development, in reaction to himself, which would not otherwise have occurred: the concept of canonicity, respect for apostolic tradition, creeds and an authoritative ministry were none of them novelties. Rather he quickened the pace of the movement toward that presentation of "the catholic church" which is worked out in, for instance, Tertullian's *De praescriptione haereticorum*. That the dangers of excessive rigidity, traditionalism and institutionalism were not completely avoided is probable, and Montanism (*q.v.*) may be interpreted as in part a reaction from these aspects of catholicism. (*See* also Gnosticism.)

Marcionite churches spread rapidly through the empire, but the movement lost impetus in the west before the 3rd century was over. They probably merged into Manichaeism (*q.v.*). That they flourished longer in the east was shown by Cyril of Jerusalem (*c.* 350), who supposed that any city may contain a Marcionite conventicle; by Theodoret of Cyrrhus (in the middle of the 5th century), who converted many Marcionites in his diocese; and by Eznik's writings against those in Armenia. Clear traces of Marcionism proper were lost after the 7th century, but the dualism of the Marcionites, their suspicion of the flesh and their asceticism reappeared in other sects, such as the Paulicians and Bogomils, as well as in the Manichees. More modern tendencies among Christians to dismiss the Old Testament are often called Marcionism, while theologians who distrust natural theology and natural law sometimes express their understanding of the uniqueness of revelation in Christ in terms which recall those of Marcion himself.

BIBLIOGRAPHY.—The chief ancient authorities are Irenaeus and Tertullian, as cited above. Modern study is based on A. von Harnack, *Marcion: das Evangelium vom fremden Gott*, no. 45 of *Texte und Untersuchungen zur Geschichte der altchristlichen Literatur* (1921; 2nd ed. 1924), with his *Neue Studien zu Marcion* (1923) in which he replied to his chief critics. Harnack's views drew attention to Marcion's greatness and influence, but overstated them. *See* also E. C. Blackman, *Marcion and His Influence* (1948, 1950); also John Knox, *Marcion and the New Testament* (1942). (S. L. G.)

MARCOMANNI (MARCOMĀNI) were a German tribe who settled in the Main valley soon after 100 B.C. To escape Roman aggression in 9 B.C. they migrated east to Bohemia, where under their king Maroboduus they built an exceedingly powerful confederation of tribes. Tiberius was planning a major attack on them in A.D. 6, when he was recalled by revolt in Pannonia; but the kingdom broke up after a war with Arminius (*q.v.*) and in 19 Maroboduus became an exile in Roman territory. For many decades thereafter the Marcomanni and their neighbours the Quadi were clients of Rome, receiving frequent subsidies; and many Roman traders settled in their country. An attack by both tribes on Domitian in 88–89 was an isolated incident. But in 167 (probably) the Marcomanni with many allies invaded Pannonia

and penetrated into Italy. Marcus Aurelius expelled them, but was involved in war with them almost constantly till his death in 180, having apparently decided to annex their country. His plans were abandoned by his son Commodus, and from then on the Romans were on the defensive. The actual tribe is seldom mentioned again, but it doubtless formed part of the later "Alamannic" confederations.

MARCONI, MARCHESE GUGLIELMO (1874–1937), Italian physicist, the inventor of a practical system of radiotelegraphy, was born in Bologna on April 25, 1874, the son of an Italian country gentleman who had married the daughter of Andrew Jameson of County Wexford, Ire. Educated first in Bologna and later in Florence, Marconi then went to the technical school of Leghorn, where he studied physics under Vincenzo Rosa and had every opportunity of investigating electromagnetic (or hertzian) wave technique, following the earlier mathematical work of James Clerk Maxwell and the experiments of Heinrich Hertz, Édouard Branly, Sir Oliver Lodge, Augusto Righi and others.

In 1894 Marconi began experimenting at his father's estate in Pontecchio, near Bologna, using comparatively crude apparatus: an induction coil with a spark discharger controlled by a Morse key at the sending end and a simple coherer at the receiver. After preliminary experiments over a short distance, he first improved the coherer and made it self-restoring in operation; then, by systematic tests, he showed that the range of signaling was increased by using a vertical aerial with a metal plate or cylinder at the top of a pole connected through the spark gap to a similar plate on the ground. In this way, the range of signaling was increased to about $1\frac{1}{2}$ mi., and Marconi had convinced himself of the possibilities of this new system of communication. It was at this period also that he conducted some simple experiments with reflectors around the aerial to concentrate the radiated electrical energy into a beam instead of spreading it in all directions.

As he received little encouragement to continue his experiments in Italy, he went to England, and in Feb. 1896 he arrived in London and met William Preece, engineer in chief of the post office, who offered him assistance and encouragement. Marconi filed his first patent in England in June 1896 and, during that and the following year, he gave a series of successful demonstrations, in some of which he used balloons and kites to obtain greater height for his aerials. He was able to send signals over distances of up to 4 mi. on Salisbury plain and to nearly 9 mi. across the Bristol channel. These tests, together with Preece's lectures on them, attracted considerable publicity both in England and abroad; and, in June 1897, Marconi went to La Spezia, where a land station was erected and communication was established with Italian warships at distances of up to 12 mi.

There was, however, still much skepticism about the useful application of this means of communication and a lack of interest in its exploitation. But Marconi's cousin Jameson Davis, a practicing engineer, financed his patent and was instrumental in the formation of the Wireless Telegraph and Signal Co., Ltd., the name of which was changed in 1900 to Marconi's Wireless Telegraph Co., Ltd. John Ambrose Fleming, who was to patent the first two-electrode thermionic valve in 1904, became scientific adviser to the company, the efforts of which for some time were devoted to assisting Marconi in his continuous endeavour to show to the full the possibilities of radiotelegraphy. A further step was taken in 1899, when a wireless station was established at South Foreland, Eng., for communicating with Wimereux in France, a distance of 31 mi.; in the same year British battleships exchanged messages at 75 mi.

In Sept. 1899 Marconi equipped two U.S. ships to report to newspapers in New York city the progress of the yacht race for the America's cup. This was another great success, arousing world-wide excitement and leading to the formation of the American Marconi company. The following year the Marconi International Marine Communication Co., Ltd., was established for the

purpose of installing and operating services between ships and land stations. In 1900, also, Marconi filed the famous patent No. 7777 for "Improvements in Apparatus for Wireless Telegraphy." This was based on the earlier work of Sir Oliver Lodge in tuning wireless transmitters and receivers, enabling several stations to operate on different wave lengths without interference.

Marconi's great triumph was, however, yet to come. In spite of the opinion expressed by some distinguished mathematicians that the curvature of the earth would limit practical communication by means of electric waves to a distance of 100–200 mi. Marconi succeeded in Dec. 1901 in receiving at St. John's, Nfld. signals transmitted across the Atlantic ocean from Poldhu in Cornwall, Eng. This achievement created an immense sensation in every part of the civilized world; and, though much remained to be learned about the laws of propagation of radio waves around the earth and through the atmosphere, it was the starting point of the vast development of radio communications, broadcasting and navigation services that took place in the next 50 years, in much of which, moreover, Marconi himself continued to play an important part.

During a voyage on the U.S. liner "Philadelphia" in 1902, Marconi received messages from distances of 700 mi. by day and 2,000 mi. by night. He thus first discovered the fact that, because some radio waves travel by reflection from the upper regions of the atmosphere, transmission conditions are sometimes more favourable at night than during the day. It was in 1902 also that Marconi patented the magnetic detector, and during the next three years he developed and patented the horizontal directional aerial. Both of these devices improved the efficiency of the communication system. In 1910, assisted by H. J. Round, he received messages at Buenos Aires, Arg., from Clifden in Ireland over a distance of about 6,000 mi., using a wave length of about 8,000 m. Two years later Marconi introduced the timed-spark system of generating pseudocontinuous waves in place of the damped trains of waves produced by the older spark transmitters. This effected a considerable improvement in the selectivity of transmission and reception with a further gain in efficiency. The system was used for several years at many important long-distance stations, and Marconi used it to send the first messages ever transmitted by radio from England to Australia, in Sept. 1918.

In spite of the rapid and widespread developments then taking place in the various aspects of radio and its applications to communication, to navigation and to the safety of life at sea, Marconi's intuition and urge to experiment toward greater accomplishments were by no means exhausted. It was in 1916, during World War I, that he saw the possible advantages of using shorter wave lengths. For example, the shorter waves permitted the use of reflectors around the aerial, which in wartime minimized the interception of the transmitted signals by the enemy and also effected an increase in signal strength. After tests in Italy (20 years after his original experiments with reflectors), Marconi continued the work in Great Britain with C. S. Franklin and, on a wave length of 15 m., received signals over a range of 20–100 mi. In 1923 the experiments were continued with G. A. Mathieu on board the steam yacht "Eletra," which had been specially fitted up. From a transmitter of 1 kw. at Poldhu, signals were received at a distance of 1,400 mi., much louder than those from Caernarvon on a wave length several hundred times as great and with 100 times the power at the transmitter. Thus began the development of short-wave wireless communication which, with the use of the beam aerial system for concentrating the energy in the desired direction, constitutes the basis of nearly all modern long-distance radio communication. It was in 1924 that the Marconi company obtained a contract from the post office for the establishment of short-wave communication between England and the countries of the British Commonwealth.

A few years later Marconi returned to the study of still shorter waves and, with the aid of valve-oscillator technique, examined the range possibilities of wave lengths of about half a metre. At these very short wave lengths, a parabolic reflector of moderate size gives a considerable increase in radiated power in the desired direction. Experiments conducted off the coast of Italy on the

yacht "Elettra" soon showed that useful ranges of communication could be achieved with low-powered transmitters. In 1932 Marconi installed a radiotelephone system using very short wave lengths between the Vatican and the pope's palace at Castel Gandolfo. In later work, Marconi once more demonstrated that even radio waves as short as 55 cm. are not limited in range to the horizon or to optical distance between transmitter and receiver.

Marconi received many honours and several honorary degrees: he was created a knight of Italy (1902); made a freeman of Rome (1903); awarded the Nobel prize for physics, the Albert medal of the Royal Society of Arts and, in the United States, the Franklin and John Fritz medals (1909); appointed an honorary Grand Cross of the Victorian Order (1914); sent as plenipotentiary delegate to the peace conference in Paris (1919), in which capacity he signed the peace treaties with Austria and with Bulgaria; created *marquess* and nominated to the Italian senate (1929); and chosen president of the Royal Italian Academy (1930). Marconi died in Rome on July 20, 1937, and was accorded a state funeral by the Italian government. At his own wish, he was buried at his native town of Bologna.

(R. L. S.-R.)

MARCUS, SAINT, pope in 336 (Jan. 18–Oct. 7) or, as other sources claim, from 337 to 340, is credited with having established the right of bishops of Ostia to consecrate new popes. He also is said to have founded the present church of S. Marco in Rome, and another over the catacomb of Balbina, but a letter alleged to have been sent by him to Athanasius is now regarded as spurious. His feast day is Oct. 7.

(G. E. McC.)

MARCUS AURELIUS ANTONINUS (121–180), Roman emperor 161–180, was born on April 26, 121. His father's father was Annianus Verus (three times consul, and prefect of the city), his mother's father Calvisius Tullus Ruso, his aunt the wife of Antoninus Pius. Thus he was related to, and inherited the wealth of, several families of the "new establishment" of Rome who had risen to power and influence under the Flavian emperors. His original name was Marcus Annianus Verus; when Antoninus was adopted to be Hadrian's successor in 138 he in his turn adopted the young M. Annianus, along with Lucius Ceionius Commodus, the son of Hadrian's original choice for the succession, and the youths were renamed M. Aelius Aurelius Verus and L. Aelius Aurelius Commodus, respectively. Marcus, intelligent and serious, became dissatisfied with the traditional education in Greek and Latin rhetoric and devoted himself to the Stoic philosophy and the law. He was consul in 140, 145 and 161, and worked untiringly at the side of Antoninus, learning the business of government. In 145 he married his cousin, Antoninus' daughter Annia Galeria Faustina.

On March 7, 161, Antoninus died, and Marcus (henceforth Emperor Caesar M. Aurelius Antoninus Augustus) became emperor; he associated Commodus with him in this position (as Emperor Caesar L. Aurelius Verus Augustus), and for the first time the Roman empire had two joint emperors of equal constitutional status and powers—but not equal *auctoritas*, for although L. Verus has suffered by comparison with Marcus it seems probable that the serious work of government was done throughout by Marcus. He was tragically unlucky in having to spend most of his principate fighting frontier wars and combating the effects of plague and demoralization.

In 161 there was an invasion of Syria by the Parthians. The war that followed (162–166) was nominally under the command of L. Verus, though its successful conclusion, and the overrunning of Armenia and Mesopotamia, were the work of subordinate generals, notably Gaius Avidius Cassius. The returning armies brought back with them a plague which raged the length and breadth of the empire for many years. In 167 or 168 (the chronology of the northern wars is subject to controversy) Marcus and Verus together set out on a punitive expedition across the Danube, and behind their backs a horde of German tribes invaded Italy in strength and numbers reminiscent of the days of Gaius Marius and besieged Aquileia. The military weakness of the empire stood revealed; desperate measures were adopted to fill the depleted legions and imperial property was auctioned to provide emergency funds. Marcus and Verus fought the Germans off with

success, but in 169 Verus died. Three years of fighting were needed, with Marcus in the thick of it, to restore the Danube frontier, and three further years' campaigning in Bohemia were enough to bring the tribes beyond the Danube to peace, at least for a time. Egypt, Spain and Britain were at the same time troubled by rebellions or invasions. In 175 Avidius Cassius, who was virtually a kind of prefect of all the eastern provinces, took the occasion of a rumour of Marcus' death to proclaim himself emperor; he controlled Egypt. Marcus made peace in the north with those tribes not already subjugated, and prepared to march against Avidius, but Avidius was assassinated by his own soldiers. Marcus then took the opportunity to make a tour of pacification and inspection of the east, visiting Antioch, Alexandria and Athens—where, like Hadrian, he was initiated into the mysteries of Eleusis. During the journey the empress Faustina died, and was accorded honours similar to those paid to her mother (*see ANTONINUS PIUS*).

In 177 Marcus proclaimed his son Commodus joint emperor, and in 178 the Danube wars were resumed. Marcus was determined to pass from defense to offense and further expansion of Rome's northern boundaries, and his determination seemed to be winning success when, on March 17, 180, he died suddenly at his headquarters, having just had time to commend Commodus to the chief advisers of the regime. Commodus very soon called a retreat, which may have been the right policy, though he is censured for it; certainly Marcus' expansionism had been called in question before he died, and the northern wars must have been costly.

Marcus had not much time or energy left to initiate original trends of civil policy. Many lines of development, some valuable, some pernicious, continued steadily as they had done ever since Flavian times. The emperor was now supreme legislative authority, and both the help given by the senate in running the empire and also the initiative of local governments had declined—the subjects of Rome had lapsed into a "paternalistic" frame of mind, in which all responsibility was laid on the emperor all the time, and this crushing burden could only with difficulty be sustained by one man. That there were now two equal Augusti is therefore not surprising; it needs only to be emphasized that constitutionally there was no territorial division—Marcus and Verus, and later Marcus and Commodus, were joint emperors over all, like the ancient consuls. The senate was treated with grave respect. It had changed its character in that many (perhaps half) of its members were non-Italian, making it a kind of universal club of administrators; as individuals, however, senators still held most of the important posts. The equestrian civil service continued to grow, and the role of permanent secretaries and praetorian prefects in the inner counsels of government was by Marcus' time very great.

The financial policy of Marcus is not easy to estimate. Antoninus Pius had left a substantial treasury surplus, and though the wars were expensive Marcus was not parsimonious; in 178 he followed Hadrian in granting an enormous remission of tax arrears, and like Antoninus he gave huge largesses. It is not certain therefore that his sales of imperial property were due to more than temporary stringency. There does not seem to have been a general increase in taxation, and though debasement of the silver content of the coinage was proceeding all the time it was not yet on a dangerous scale. On the other hand the financial structure of the empire was too rigid to meet emergencies; there was no real reserve.

The field of activity which was most congenial to Marcus, as to his predecessor, was the law. Numerous measures were taken and judicial decisions made, clearing away harshnesses and anomalies in the private law, improving the lot of the weak and helpless—widows, slaves, minors—and recognizing the claims of blood as against those of the agnatic family. Under Marcus that celebrated elementary handbook was written from which modern knowledge of the classical law of Rome is largely derived: the *Institutes* of Gaius; and works of interpretation and the beginnings of systematic treatment of administrative law were undertaken. Yet two anomalies must be mentioned. Firstly, it was in the

Antonine period that the law became a respecter of persons in a new way; the distinction was more and more sharply made between *honestiores* (upper class) and *humiliores* (lower class), and the sanctions imposed on them—harsher always for the *humiliores*. Secondly, in relation to Christianity: there was no systematic persecution of Christians under Marcus Aurelius; the legal situation remained as it had been under Trajan and Hadrian: Christians were *ipso facto* punishable, but not to be sought out, and if they ran into the embraces of martyrdom by their inflexible and deliberate stubbornness, that was their fault. This illogical position did little harm in times of general security and prosperity, but when and where security and prosperity were threatened the local population might rise against Christians, a governor might be forced to act and the central authority took the view that the law must take its course. Of this nature were the martyrdoms of Lyons in 177, and it appears that Christian blood flowed more profusely in the principate of Marcus Aurelius the philosopher than it had done before.

One of the world's famous and influential books is the *Meditations* or "soliloquies" of Marcus Aurelius. To what extent he intended them for eyes other than his own is uncertain; they are fragmentary notes, discursive and epigrammatic by turn, of his reflexions in the midst of battle and administration, by which he kept alive in himself the Stoic precepts learnt from his teacher in his youth, and so nerved himself for his enormous tasks. In no sense are they original philosophy, but they give a valuable picture of what Stoicism as a practical way of life meant to a high-minded Roman of the 2nd century. Perhaps the most interesting thing about them is that they—the inmost thoughts of a Roman emperor—are written in Greek; to such an extent had the union of cultures become a reality. There is no reason to doubt that Marcus' *Meditations* reflect his life, which was noble and self-sacrificing.

Apart from the *Meditations* the most enduring monument of Marcus is the column erected to his memory which now stands in Piazza Colonna in Rome, a worthy successor to that of Trajan, with a spiral frieze in very high relief telling (whether chronologically or not) the story of the Danube wars in a brutally realistic and dramatic style.

MARCY, WILLIAM LEARNED (1786-1857), U.S. politician, state governor and cabinet member, was born in Southbridge, Mass., on Dec. 12, 1786. He graduated from Brown university, Providence, R.I., in 1808, studied law, was admitted to the bar in Troy, N.Y., and began practice there in 1810. During the War of 1812 he served as captain of volunteers and took part in the storming of the British post at St. Régis, Que., on Oct. 22, 1812. As editor of the *Troy Budget* he was a vigorous supporter of Martin Van Buren (then a member of the New York senate), and when Van Buren's followers acquired control of the legislature in 1821 Marcy became adjutant general of the New York militia. From 1823 to 1829 Marcy was comptroller of the state and became a leading member of the Albany regency, a group of powerful Democratic politicians at the state capital. After serving as an associate justice of the New York supreme court in 1829-31, he entered the U.S. senate in Dec. 1831. In a senate speech defending Van Buren against an attack by Henry Clay,

Marcy made the remark that, "to the victor belong the spoils of the enemy," and thereby became known as a champion of the "spoils system," the policy of removing political opponents from office and replacing them by political friends. He resigned from the senate in Jan. 1833 to become governor of New York, serving in that capacity for six years.

In 1844 Marcy was recognized as one of the leaders of the "Hunkers," or regular New York Democrats, and an active opponent of the "Barnburners" under Van Buren. He was secretary of war in President Polk's cabinet in 1845-49, ably discharging his duties during the Mexican War. From 1853 to 1857 he served as secretary of state in the cabinet of President Pierce.

As secretary of state, Marcy issued the "Dress Circular" of 1856 which recommended that, whenever practicable, U.S. diplomatic agents abroad should "appear in the simple dress of an American citizen." In 1867 this recommendation was enacted into law by congress. In 1853 Marcy secured approval of the Gadsden treaty which adjusted the boundary dispute between Mexico and the United States and added a substantial area to the federal domain. His diplomatic capabilities were put to an even greater test the following year by the Black Warrior case in which he prudently avoided war with Spain. Marcy was not averse to obtaining Cuba in an honourable manner, and it was at his suggestion that James Buchanan, J. Y. Mason and Pierre Soulé, ministers respectively to Great Britain, France and Spain, met at Ostend and Aachen in Oct. 1854 to discuss the Cuban question. But the resulting Ostend Manifesto (*q.v.*) was too extreme and Marcy promptly disavowed it. In domestic affairs Marcy was a shrewd but honest partisan; in diplomacy he was a broadminded, patriotic statesman, endowed with vigour rather than brilliancy of intellect. He died at Ballston Spa, N.Y., on July 4, 1857.

See S. F. Bemis et al. (eds.), *The American Secretaries of State and Their Diplomacy* (1927-29). (N. A. G.)

MAR DEL PLATA, Argentine coastal city, primarily important as a seaside resort and known to Argentines as the "Pearl of the Atlantic," located 250 mi. S. of Buenos Aires, in Buenos Aires province. Pop. (1960) 203,093. Settled in the 1850s as site for a meat-salting plant, Mar del Plata did not become a resort area until the early 20th century. Extensive beaches, a pleasant climate, night clubs and a government-controlled casino add to the tourist attraction. The harbour is an important port for the Argentine fishing fleet, and large canneries have been built to process the catch. (Js. R. S.)

MARDI GRAS: see CARNIVAL; SHROVE TUESDAY.

MARDIN, the capital of the *il* (province) of Mardin in south-eastern Turkey, lies about 30 mi. N.W. of Nusaybin on a branch line of the Istanbul-Baghdad railway. Pop. (1960) 27,390. It is situated on the southern slopes of a broad highland, rising to an altitude of 3,450 ft., and overlooks extensive limestone plateaus. The Mardin highland receives relatively more rainfall than its lower surroundings. Summer is very hot and the temperature may reach 42° C. (108° F.); in winter the average January temperature is 3° (37°). On a nearby hill are the remains of a citadel, founded in Roman times and refortified during the medieval period. The town is an active trading centre of local importance and on the caravan route between east and west. A main road leads west to Urfa and so to Aleppo in Syria via Gaziantep; a good highway runs northwest to Diyarbakir. Another road runs south-east through Nusaybin to the Tigris and connects with Mosul and Baghdad in Iraq.

MARDIN IL (pop. [1960] 353,411; area 4,921 sq.mi.) is bounded on the south by Syria. It is agriculturally rich, the principal products being wheat, barley and sesame. Some wool is produced and there is a small cotton and woollen weaving industry. The population is mixed and includes (in addition to Turks) Arabs, Kurds and a medley of Asians, including "Jacobites" or members of the Syrian Monophysite Church.

(N. Tu.; E. Tu.; S. Er.)
MARDONIUS (d. 479 B.C.), Persian general who was nephew of King Darius I (*q.v.*) and married to Darius' daughter Artazostra. In 492 he was sent to succeed Artaphernes in the settlement of Ionia with a special commission to attack Athens and

Eretria. Contrary to the usual Persian policy, he restored democracies in Ionia. After this he crossed the Hellespont and invaded Thrace and Macedonia. His fleet was wrecked off Athos with enormous loss; because of this setback he was deprived of his command. According to Herodotus, Mardonius was, from motives of ambition, one of Xerxes' instigators in the invasion of Greece. After the Persian defeat at Salamis he persuaded Xerxes to return to Asia and himself stayed behind with a large army. He was defeated by Pausanias and killed at Plataea in Sept. 479. See GRECO-PERSIAN WARS.

MARDUK, the chief god of the city of Babylon and the national god of Babylonia. (As such he was eventually called simply Bel, "lord"; see BEL.) His name, probably Sumerian, is of uncertain meaning: "calf of the sun," "young buffalo of the sun," "infant sun" (i.e., of spring). Theophoric names of the early 2nd millennium B.C. contain the element "Marduk." Marduk's name predominates in official inscriptions of the reign of Ammiditana, the third successor of Hammurabi. In Hammurabi's own reign (c. 1800 B.C.), Marduk is styled "son of Ea" (Sumerian Enki, "Lord of the Earth"), the god of the fresh-water ocean and of wisdom. Marduk's "Enlilship" or lordship over the great gods of heaven, the Igigi, is attributed to Anu, god of the sky, and to Enlil, god of the atmosphere. A poem, known from its opening words as *Enuma Elish*, and probably dating from the end of the 2nd millennium B.C., relates Marduk's rise to such pre-eminence that he is the god of 50 names, each one that of a deity or of a divine attribute. Because it is his mission to conquer the monster of primeval chaos, Tiamat, to him are given all the powers and prerogatives of all gods. He becomes "lord of the gods of heaven and earth, king of the gods of heaven and earth, king of all gods and kings and lord of all lords." All nature, including man, owes its existence to him; the destiny of kingdoms and subjects is in his hands. He is the source of law and civilization (see also CREATION, MYTHS OF).

Deities whose functions Marduk appropriates retain their place and prestige, however. His own chief cult centre as national god is the capital city of Babylon; while his son Nabu (q.v.) reigns supreme at nearby Borsippa. In the heart of Babylon were the temples Esangila, "the abode of the lord of Babylon, the supreme god Marduk," and Etemenanki, which was a storied tower or ziggurat, with a shrine of Marduk on the top; and subsidiary buildings (see BABYLON). In Esangila the poem *Enuma Elish* was recited every year at the New Year festival.

In poems and hymns Marduk is celebrated as "benefactor" and "merciful." A poem, whose contents have caused it to be named "the poem of the righteous sufferer," expresses thanks to him for his saving intervention. As god of medicine, equal in knowledge to his father, Ea, he is much invoked in incantations and exorcisms.

The lady of Marduk is Sharpanit (Sarpanitum), "brilliant as silver," who "shines resplendent among the stars." Her name is also written Zerbanitu, "who created seed." Other goddesses also are named as ladies of Marduk: Gula, Ishtar, Nana, Shala. His star is Jupiter, under various names: Shulpae, Saggemgar, Nebiru. He is also identified with the sun, the moon and other heavenly bodies. Animals sacred to him are horses, dogs and especially the so-called dragon with forked tongue which adorns his city's walls. On the oldest monuments Marduk is represented holding a triangular spade or hoe, interpreted as an emblem of the fertility and vegetation which are his gifts. He is also pictured on foot, walking or on his war chariot. His tunic is adorned with stars; in his hand is the sceptre and for armour he carries bow, spear, net or thunderbolt. An image of Marduk survives on a great lapis-lazuli inscription of the 9th century B.C., found at Babylon.

Kings of Assyria, too, do honour to Marduk and Sharpanit on inscriptions. Sargon II (722-705 B.C.) claims the consent of Marduk to his victorious entry into Babylon and is lavish with gifts to his shrine. Other Assyrian kings follow suit. An acrostic hymn in the dialect of Assyria in honour of the god and his spouse was composed in the name of King Ashurbanipal (669-630). Cyrus II the Great of Persia claimed that he was called by Marduk to overthrow Nabonidus of Babylon (556-539) because that king

had preferred some other god to Marduk. Under Cyrus and the Seleucids, temples of Marduk were rebuilt. See BABYLONIA AND ASSYRIA: Religion; Assyro-Babylonian Pantheon; see also references under "Marduk" in the Index.

MARE CLAUSUM and **MARE LIBERUM** (Lat. for "closed sea" and "free sea"), in international law terms associated with the historic controversy which arose out of demands on the part of different states to assert exclusive dominion over areas of the open or high sea. Thus Spain and Portugal laid claim to exclusive dominion over whole oceans, Great Britain to the narrow seas, and so on. These claims gave rise to vigorous opposition by other powers and led to the publication of Hugo Grotius' work *Mare liberum* (1609). In *Mare clausum*, written in 1617-18 and published in 1635, John Selden asserted "that the sea by the law of nature or nations is not common to all men but capable of private dominion or property as well as the land." A formula was found, on the other hand, by Cornelis van Bynkershoek in his *De dominio maris* (1702), for the restriction of dominion over the sea to the actual distance which could be protected by cannon range; i.e., three marine miles (see WATERS, TERRITORIAL).

MAREDSOUS, the first Benedictine abbey established in Belgium after the 1830 Revolution, was founded near Namur in 1872 by the family of Desclée de Tournai and colonized by monks from Beuron in Germany under a young Belgian, Hildebrand de Hemptinne. In 1878 the foundation was erected into an abbey. From the beginning it has been an active centre of Benedictine life and learning, with special interest in liturgical and historical studies. *Le Messager des Fidèles*, first published at Maredsous in 1884 as a liturgical review by Gerard van Caloen, was enlarged in scope to become the *Revue Bénédictine* in 1890. Among its most distinguished historians were Germain Morin, Ursmer Berlière and Philibert Schmitz. Columba Marmion, abbot 1909-23, wrote outstanding works on spiritual discipline. Daughter houses of Maredsous are Mont-César in Louvain (founded 1899), Glenstal in Ireland (1927) and Gihindamuyaga in Rwanda (1959).

(M. M. CH.)

MAREE, LOCH, a fresh-water loch in the county of Ross and Cromarty, Scot. Its name commemorates St. Maelrubha or St. Maree, who in 671 founded a monastery at Applecross and a chapel on Isle Maree. The lake is 12½ mi. long from Kinlochewe, at the head of the dam erected in the 16th century (or earlier) by the iron smelters of the Cheardach Ruardh, or Red Smiddy, on the river Ewe, by which it drains to the sea. Its greatest breadth is just over 2 mi. at Slattadale, and the greatest depth 367 ft. There are more than 30 islets, covering an area of nearly 1 sq.mi. and lying mostly north and east of Slattadale. The largest is Eilean Subhainn, or St. Swithin's Isle, which contains two small lakes. For two-thirds of its length the loch is flanked by mountains. On the northeast the principal heights are Ben Slioch (3,217 ft.), Ben Lair and Benn Airidh Charr, and, on the southwest, the peaks of Ben Eay, four of which exceed 3,000 ft. Sea trout and salmon are taken in the loch. The National Nature reserve at Kinlochewe was the first of its kind established in Great Britain.

MARÉES, HANS VON (1837-1887), German painter, was born at Elberfeld on Dec. 24, 1837. In 1853 he went to Berlin, where he studied for two years under Steffeck. For the next eight years he worked chiefly in Munich, coming under the influence of the historical school, and in 1864 he went to Italy, where he lived for about 20 years. He also traveled in Spain and France and spent some time in Berlin. In 1873 he received his most important commission, the painting of frescoes in the library of the Zoological museum at Naples. Although ambitious, Marées lacked self-confidence, and in the latter part of his life ceased to

exhibit his work. He died in Rome on June 5, 1887, a disappointed and practically unknown man. When his works were collected at the Munich exhibition in 1891, their value became apparent, as in "The Oarsmen," a subject he often painted.

MAREMMA, a district of central Italy along the Tyrrhenian coast, largely within the Tuscany region, includes the coastal stretch from south of Leghorn to the Campagna di Roma, as well as the Apennine foothills overlooking the coast. In Etruscan and Roman times the Maremma was well settled and famed for its farms, which were drained by subterranean canals. Among the Etruscan towns situated on hilltops, Populonia, Cosa, Tarquinii and Caere were the largest, and several ports handled Etruria's foreign trade. During the later years of the empire the region declined rapidly, drainage was neglected, malaria became endemic and the Maremma, until the early 20th century, served only as a winter grazing ground for herds from the Apennines. Beginning in 1951 the Maremma Land Reform agency spent considerable sums on the region, and new farms, roads and rural service centres were built, changing the face of the Maremma beyond recognition. Much was undone in 1966 when torrential rainstorms and the flooding of the Ombrone river inundated the land, with disastrous loss of livestock and equipment. (G. Kh.)

MARENGO, BATTLE OF, a battle fought 4½ mi. E.S.E. of Alessandria in Piedmont, Italy, between the French under Napoleon Bonaparte and the Austrians under Michael Melas on June 14, 1800, early in the Napoleonic Wars (q.v.). Having brought his army into Italy via the St. Bernard pass in May, Bonaparte moved westward to threaten the Austrians' rear. A number of oversights in the execution of his fundamentally sound strategy immediately before the battle came very close to causing the destruction of Bonaparte's army, for they enabled Melas to concentrate 30,000 men and more than 100 guns with which to launch an unanticipated attack on the French army's 19,000 men and 14 cannon early on June 14. By late afternoon the French, who resisted stubbornly, had been obliged to yield considerable ground. The Austrians' advance, however, was too deliberate, and gave Desaix time to march a division to Bonaparte's support. When he arrived the Austrians were forming a large column to press home their advantage. About 5 p.m. Desaix's men came into action against the head of the column; Desaix fell in the attack that drove back the leading Austrian troops, whose confusion was completed when Kellermann's 400 cavalry charged their flank. The Austrians were given no time to recover their balance, and surprise soon yielded to panic. The French now assumed the offensive along the entire front, and by nightfall the Austrians were in full rout. Next day Melas signed a convention by which the Austrians evacuated northern Italy west of the Mincio river. The French had lost about 4,000 men, the Austrians 9,500. (J. H. N.)

MARENZIO, LUCA (1553/54–1599), the greatest Italian madrigalist of his generation, was born in Coccaglio. He may have served as a choirboy in the nearby town of Brescia. By 1578 he was in service with Cardinal Luigi d'Este in Rome, where he remained until 1586. In 1588 he went to Florence, where he worked with the circle of musicians and poets associated with Count Giovanni Bardi, and later returned to Rome to serve Cardinal Cinzio Aldobrandini. In 1594 he visited Sigismund III of Poland, was in Rome in the summer of 1595 but returned to Poland in 1596. In 1598 he was in Venice, and was later appointed musician at the papal court. He died in Rome, Aug. 22, 1599.

Marenzio published a large number of madrigals and villanelle and five books of motets. His sacred works are colourful and impressive, but he is best known for his madrigals. Marenzio's early works are influenced by M. Ingeneri, but he soon developed an individual technique rarely surpassed in elegance and expressiveness. His extended forms depend upon subtle contrasts of emotional tension. He liked writing for high voices but varied his brilliance with sentiment and gravity. He was a daring harmonist: his chromaticism occasionally leads to advanced enharmonic modulations, and he sometimes leaves dissonances unresolved for dramatic effect. He exerted a strong influence on Monteverdi, Gesualdo and Hassler, and was much admired in England, where his works were first printed in N. Yonge's *Musica Transalpina* (1588).

See Madrigals ed. by A. Einstein, *Publikationen älterer Musik*, vol. iv, 1 (1929), vol. vi (1931); A. Einstein, *The Italian Madrigal* (1949); H. Engel, *Luca Marenzio* (1956). (B. L. Tr.)

MARE'S-TAIL, the popular name for an aquatic herb known botanically as *Hippuris vulgaris*, which forms the family Hippuridaceae. It is little cultivated, being of some interest in the bog or pond gardens. Some botanists divide the family into several species. Mare's-tail grows on margins of lakes, ponds and similar localities and has a submerged stout creeping rootstock, from which spring many jointed cylindrical stems bearing numerous narrow leaves close set in whorls. The minute greenish flowers are borne in the leaf axils. Like many fresh-water plants it has a wide distribution, occurring in arctic and temperate regions in the northern hemisphere and in southern South America.

MARET, HUGUES BERNARD, DUC DE BASSANO (1763–1839), French diplomat and statesman of the Napoleonic period, was born in Dijon on July 22, 1763. He embarked on a career as a lawyer; but from July 1789, in the early stages of the French Revolution, he and Maurice Méjean began publishing the debates of the Constituent Assembly in the *Bulletin de l'Assemblée*. In Jan. 1790 this *Bulletin* was merged in C. J. Panckoucke's *Moniteur universel*, for which Maret continued to provide impartial reports of debates until the dissolution of the assembly in Sept. 1791. Though he was a member of the moderate club of the Feuillants he was brought into the diplomatic service by Dumouriez, then minister of foreign affairs, in 1792 (probably in April).

After the withdrawal of the British legation from Paris, Maret was sent on a mission to London in Nov. 1792 and had two sympathetic but fruitless interviews with Pitt in December. Another mission after Louis XVI's execution was also unsuccessful: Maret arrived in London on Jan. 30, 1793, and the Convention in Paris declared war on Feb. 1. Sent in July 1793 to take up a post as French diplomatic agent in Naples, Maret was captured on his way by the Austrians in the territory of the Graubünden (Grisons) and detained till Jan. 1796. He took part in the French negotiations with the British at Lille from July 1797, but these were broken off after the *coup d'état* of Fructidor (Sept. 4).

When Napoleon Bonaparte returned from Egypt, Maret became one of his supporters. After the *coup d'état* of Brumaire (Nov. 1799) he was appointed secretary to the consuls and then secretary of state; and in 1804 his post was raised to the rank of ministry. He had the official section of the *Moniteur* under his control, accompanied Napoleon on all his campaigns of 1805–09 and was created duc de Bassano in 1809.

On April 17, 1811, Maret replaced J. B. Nompère de Champagny as minister of foreign affairs and was thus responsible for the treaties with Prussia (Feb. 1812) and with Austria (March 1812) which preceded the French invasion of Russia. He followed Napoleon as far as Vilna in 1812 and was also with him in the campaign of 1813. In Nov. 1813, however, he was replaced by Armand de Caulaincourt as minister of foreign affairs. He then resumed his post as minister-secretary of state, which he lost on Napoleon's fall in 1814 but held again in 1815 during the Hundred Days.

Exiled on the second Bourbon Restoration, Maret lived in Friuli and then at Trieste till he was allowed to return to France in Jan. 1820. After the revolution of July 1830 Louis Philippe made him a peer of France. Finally, on Nov. 10, 1834, Maret took office as prime minister and minister of the interior; but his cabinet lasted only five days. He died in Paris on May 13, 1839.

Maret was upright, hard-working and completely devoted to Napoleon, but some have blamed him for submissively adopting his master's foreign policy without explaining its dangers to him.

See A. A. Ernout, *Maret, duc de Bassano* (1878); C. P. M. Miles (ed.), *The Correspondence of W. A. Miles*, 2 vol. (1890). (C. E. Du.)

MAREY, ÉTIENNE JULES (1830–1904), French physiologist and inventor, was born March 5, 1830, at Beaune (Côte-d'Or). After receiving his bachelor's degree at Beaune in 1849, he studied medicine in Paris, where he received the M.D. degree in 1859. In 1860 he invented the sphygmograph, an instrument for recording graphically the features of the pulse and the varia-

tions in blood pressure. In 1867 he was appointed to the chair of natural history in the Collège de France. He wrote extensively on the circulation of the blood, cholera, terrestrial and aerial locomotion, experimental physiology and graphic methods in physiology. He also was a pioneer in the development of the motion picture. In order to study the flight of birds, in 1882 he invented a photographic camera with magazine plates that took a series of photographs; the pictures could be combined to represent movements. In 1894 he adapted the motion-picture camera to the microscope. He died in Paris on May 16, 1904. (T. E. K.)

MARGARET, SAINT, a virgin martyr and one of the 14 Auxiliary saints or Holy Helpers, who, according to the purely fictitious legend, rejected marriage with the prefect Olybrius at Antioch and was beheaded in consequence, after undergoing trials of remarkable extravagance. Her feast day is July 20. The story is substantially that of St. Marina of Antioch in Pisidia (July 17 in the Greek calendar). The name Marina is the Latin equivalent of the Greek name Pelagia, and the St. Margaret legend is one of the family of pious romances whose starting point seems to have been the historical St. Pelagia (q.v.); among the others are those of SS. Eugenia, Theodora of Alexandria and another Marina (or Mary). It is accordingly very doubtful whether this St. Margaret ever existed.

See H. Delehaye, *The Legends of the Saints* (1962). (D. AR.)

MARGARET, SAINT, OF SCOTLAND (c. 1045–1093), queen consort of Malcolm III (Canmore; see MALCOLM), granddaughter of the Anglo-Saxon king Edmund Ironside, daughter of Edward Aetheling and sister of Edgar (q.v.) the Aetheling. She was brought up at the Hungarian court, where her father was in exile. After the battle of Hastings, the widow and children of Edward fled for safety to Scotland, and c. 1070 Margaret married Malcolm, in spite of her leanings toward a religious life. Through her influence over her husband and his court, she promoted the interests of the English population conquered by the Scots in the previous century, as well as those of the church in conformity with the Gregorian reform. She died in Edinburgh on Nov. 16, 1093, and was canonized by Innocent IV in 1249. Some early calendars have her feast on Nov. 16, others on June 19, but it was fixed eventually on June 10. See also SCOTLAND: History.

See the account of her by her chaplain and confessor, Turgot, afterward bishop of St. Andrews, *Acta Sanctorum*, vol. ii of June (1867), Eng. trans. by W. Forbes-Leith (1884); R. L. G. Ritchie, *The Normans in Scotland* (1954). (PL. GN.)

MARGARET (1353–1412), queen of Denmark, Norway and Sweden, was born in 1353, the daughter of Valdemar IV of Denmark. She was married in 1363 to Haakon VI of Norway. On her father's death in 1375 she procured the election of her infant son Olaf as king of Denmark; and in 1380 Olaf also succeeded Haakon as king of Norway. After Olaf's death (1387) Margaret, who had ruled both kingdoms in his name, was in 1388 chosen "sovereign lady and ruler" of Norway and Denmark. She then turned to Sweden, where the nobles, in arms against their unpopular king Albert of Mecklenburg, appealed to her for help.

At a conference held at Dalaborg castle in March 1388, the Swedes were compelled to accept all Margaret's conditions, elected her "sovereign lady and ruler" or regent and engaged to accept from her any king that she chose to appoint. On Feb. 24, 1389, Albert, who had returned from Mecklenburg with an army of mercenaries, was taken prisoner at Asle near Falköping and Margaret was now the mistress of three kingdoms. Only Stockholm, then almost entirely a German city, still held out; fear of Margaret induced both the Mecklenburg princes and the Wendish towns to hasten to its assistance; and the Baltic and the North sea swarmed with the privateers of the *Viktualien brödre* or *Vitalianer*, so called because their professed object was to revictual Stockholm. Finally the Hanseatic league intervened, and by the compact of Lindholm (1395) Albert was released by Margaret on promising to pay 60,000 marks within three years. The Hanseatic league meanwhile was to hold Stockholm in pawn. Since Albert failed to pay his ransom within the stipulated time, the league surrendered Stockholm to Margaret in Sept. 1398, in exchange for confirmation of all its commercial privileges.

It had been understood that Margaret should, at the first convenient opportunity, provide the three kingdoms with a king who was to be her nearest kinsman, and in 1389 she proclaimed her infant cousin, Eric of Pomerania, king of Norway. In 1396 homage was also rendered to him in Denmark and Sweden, Margaret reserving to herself the office of regent during his minority. To weld the three kingdoms still more closely together, Margaret summoned a congress of the three councils of state and other magnates to Kalmar in June 1397; and on Trinity Sunday, June 17, the joint coronation of Eric united the kingdoms. The terms of a perpetual union also were discussed, and a draft is still extant. This much-discussed Kalmar document, the clauses of which tended to prevent amalgamation by insisting that each country should retain its own laws and customs and be administered by its own dignitaries, was never ratified. Considering its restriction of the royal power, Margaret probably rejected the proposal, but she avoided every appearance of an open rupture.

Eric was declared of age in 1401, but Margaret remained the real ruler of Scandinavia. As long as the union was insecure, Margaret had tolerated the presence near the throne of "good men" from all three realms (the *rigsraad*, or council of state, as these councilors began to be called); but their influence was always insignificant. In every direction the royal authority remained supreme. The Danish national assemblies had already fallen into disuse after 1377; the offices of high constable and earl marshal were left vacant; and Margaret ruled through her court officials acting as superior clerks. Margaret also recovered for the crown all the landed property which had been alienated since the 1360s in Denmark and Sweden. This so-called "reduction," or land-recovery, was carried out with the utmost rigour, and hundreds of estates fell to the crown. Margaret also reformed the Danish currency. In foreign politics she maintained a clever system of neutrality but she spared no pains to recover lost Danish territory. Gotland she purchased from its actual possessors, Albert of Mecklenburg and the Livonian Order, and the greater part of Schleswig was regained in the same way. Margaret died suddenly on board her ship in Flensburg harbour on Oct. 28, 1412.

MARGARET (THE MAID OF NORWAY) (1282 or 1283–1290), queen of Scotland, was the only child of Eric II, king of Norway, and Margaret, daughter of Alexander III, king of Scotland. Eric's wife died in 1283, soon followed by her only surviving brother, and the Scottish magnates accepted Margaret as heir to the throne (1284). After the death of Alexander III on March 18–19, 1286, she was proclaimed queen (July 1286). Edward I of England, her greatuncle, arranged a marriage between her and his son Edward, papal dispensation for which was granted on Nov. 16, 1289. The marriage treaty (July 18, 1290, confirmed by Edward on Aug. 28) included some safeguards of Scotland's independence. On the voyage from Norway, Margaret fell ill, and died in Orkney, then still Norwegian territory, late in Sept. 1290. The bishop of Bergen returned with her body to Bergen, where she was buried. In 1301 a woman from Lübeck who claimed to be Margaret was burned near Bergen as an impostor. By Margaret's death an ancient line became extinct. A court presided over by Edward I chose as her successor (1292) her distant cousin John de Balliol, and for more than 20 years Scotland suffered foreign domination and civil war.

See A. O. Anderson, *Early Sources of Scottish History A.D. 500 to 1286*, vol. ii (1922); A. Lang, *History of Scotland*, vol. i, 5th ed. (1929). (M. O. AN.)

MARGARET (MARGARET TUDOR) (1489–1541), queen consort of James IV of Scotland, was the eldest daughter of Henry VII, king of England, and was born at Westminster on Nov. 29, 1489. She married James IV of Scotland on Aug. 8, 1503, but the scanty dowry given by her father wrecked any chance of improved relations between the two kingdoms, despite the treaty of perpetual peace which accompanied the marriage. The rest of Margaret's life was an unending series of intrigues, first with one

political faction, then with another, her conduct being mainly influenced by considerations affecting her pocket.

Margaret was crowned in Edinburgh in March 1504. Between 1507 and 1510 she gave birth to two sons and a daughter, all of whom died in infancy. She gave birth to a son in 1512 who succeeded his father as James V and in 1514 she bore a posthumous son, Alexander, created duke of Ross, who died within two years. A dispute over a legacy with her brother, Henry VIII, was a contributory cause of the war that ended at Flodden, where James IV was killed in Sept. 1513. By his will Margaret was appointed sole guardian of the infant king, James V. At this time Scotland was divided mainly into two parties: one in favour of alliance with England and the other with France. The leader of the pro-French party was John Stewart, duke of Albany (*see* ALBANY, DUKES OF), next heir to the crown of Scotland after Margaret's sons. Margaret herself generally inclined to the English faction; and when Albany returned to Scotland from France on the invitation of the Scottish parliament in the spring of 1515, the conflict verged on civil war. Margaret's marriage to Archibald Douglas, earl of Angus (*see* ANGUS, EARLS OF), on Aug. 6, 1514, had alienated many of the nobility, especially the earls of Arran and Home, and made her entirely dependent on the house of Douglas. It also furnished the parliament with a pretext, in July 1515, for removing her from the offices of governor and tutor in favour of Albany. She fled to England in September, where she bore to Angus a daughter, Margaret (afterward countess of Lennox), who was the mother of Lord Darnley.

In 1516 Margaret went to her brother's court in London, while Angus, much to his wife's displeasure, returned to Scotland, where he made peace with Albany, was restored to his estates and formed a liaison with a daughter of the laird of Traquair. The rivalry between the French and English factions in Scotland was complicated by the struggle of Arran and Angus for supreme power in the absence of Albany in France (1517-21), where at the instance of Henry VIII he was detained by Francis I. Margaret, quarreling with her husband, at first sided with Arran and began to agitate for a divorce from Angus. In this she was probably aided by Albany, who found an unexpected ally in Margaret who was temporarily alienated from the English party by Henry VIII's opposition to her divorce. When Albany returned to Scotland in 1521 his association with Margaret gave rise to the accusation that it was with the intention of marrying her that he favoured her divorce from Angus. As Albany was strongly supported by the Scottish parliament, Angus found it necessary to withdraw to France till 1524. During these years there was constant warfare between the English and the Scots on the border but in May 1524 Albany was obliged to retire finally to France. Henry VIII continually aimed at securing possession of his nephew, the king of Scots, but he was proclaimed king in July 1524. Margaret married Henry Stewart, second son of Lord Avondale, immediately after her divorce from Angus in 1527. With her new husband, who was created Lord Methven in 1528, she became for a time the ruling influence in the counsels of James V. But when her desire to arrange a meeting between James and Henry VIII in 1534 was frustrated by the clergy and the council, Margaret in her disappointment revealed certain secrets to Henry which led to her being accused by her son of betraying him for money and of acting as an English spy. She died at Methven castle on Oct. 18, 1541.

(G. S. P.)

MARGARET OF ANGOULÊME (1492-1549), queen consort of Navarre from 1527 and one of the outstanding figures of the French Renaissance both as the patron of humanists and reformers and as the author of the *Heptaméron*, was born at Angoulême on April 11, 1492, the daughter of Charles de Valois-Orléans, comte d'Angoulême, and Louise of Savoy. Though her first marriage (1509), to Charles, duc d'Alençon, was not very satisfactory, she became the most influential woman in France, next to her mother, when her brother acceded to the kingdom as Francis I (1515). Widowed in 1525, she was next married, in 1527, to Henry II of Navarre (Henry d'Albret). Her brother could not fulfill his promise of recovering Navarre south of the Pyrenees for the couple from the Spaniards, but his generosity enabled Margaret to keep

small courts at Nérac in Gascony and at Pau in Béarn and to continue her distinguished patronage of artists and writers.

Margaret extended her protection both to men of purely literary genius and to the advocates of doctrinal and disciplinary reform in the church. François Rabelais, Clément Marot, Bonaventure des Périers and Étienne Dolet were all included in her circle. Any sympathy that she may have had with Lutheranism can only have come from her attachment to St. Paul's teaching, on which she accepted the views of Jacques Lefèvre d'Étaples and Guillaume Briçonnet; and she was certainly not a Calvinist. On her deathbed she asserted that she had supported the Reformers, not because she agreed with all their beliefs, but out of "pure compassion." Her personal religious inclinations seem to have been toward a sort of mystical pietism, which she carried to such extremes that her correspondence with Briçonnet is barely intelligible. She wanted reform within the Catholic Church. Having always sought to dissuade Francis I from intolerant measures, she disapproved of the persecution launched after the "affair of the Placards" in 1534 (*see* FRANCE: *History*; HUGUENOTS). When Francis intensified the persecution of heretics and freethinkers, Margaret could do nothing to save Des Périers, Dolet or Marot.

By her first husband she had no children; but by Henry II of Navarre she had a daughter, Jeanne d'Albret (1528-72; mother of the future Henry IV of France), and a son who died in infancy. She soon became estranged from Henry II and could not maintain a happy relationship with her Calvinist daughter. Her brother was her cynosure, and she survived him by less than three years, dying at Odos-en-Bigorre on Dec. 21, 1549.

Of Margaret's literary works, the most important is the *Heptaméron*, constructed on the lines of Boccaccio's *Decameron* and consisting of 72 short stories (out of a planned 100) told by a group of travelers delayed by a flood on their return from a Pyrenean spa. Originally published in 1558 under the title *Histoire des amants fortunez*, it was reissued in 1559 by Claude Gruget, who gave it the name *Heptaméron*. Its dedication to Jeanne d'Albret, together with internal evidence, left no room for doubt as to its authorship, but it is very likely that Margaret engaged members of her court to collaborate with her on it. The stories, illustrating the triumphs of virtue, honour or quick-wittedness and the frustration of vice and hypocrisy, with a strong element of satire against licentious and grasping monks and clerics may be taken as characteristic of the atmosphere of Margaret's court. The best edition is by A. Le Roux de Lincy (4 vol., 1880) from which J. S. Chartres prepared an English translation (5 vol., 3rd ed., 1928).

A devotional poem of Margaret's, the *Miroir de l'âme pécheresse* (1531), was translated by Elizabeth of England as *A Godly Meditation of the Soul* (1548). The *Marguerites de la marguerite des princesses* (1547; modern ed. F. Frank, 4 vol., 1873) are miscellaneous poems and farces, mostly artificial and elaborate in style. Her best verse is to be found in *Les Dernières Poésies* (a long published by A. Lefranc (1896) and including *Les Prisons* (a long allegory) and *Le Navire* (a remarkable expression of her despair at Francis I's death; cf. the later edition of this by R. Marichal, 1956). There is also an edition of her *Lettres* by F. Génin (4 vol., 1841-42).

MARGARET OF ANJOU (1429-1482), queen consort of Henry VI, king of England, was the daughter of René I of Anjou, the titular king of Naples, and was born on March 23, 1429, at the Chateau Keure in her father's duchy of Lorraine. She was brought up in Anjou by her grandmother, Yolande of Aragon, and was betrothed to Henry in 1444 as part of a truce between England and France. They were married at Titchfield abbey on April 23, 1445. At this time she had the assets of youth, beauty and an amenable husband. But she had come to England bringing not a dowry, for her father was penniless, but the shame of surrender; for her marriage had been bought by a secret promise to cede the English holds in Maine. Furthermore, as the match had

been negotiated by the earl of Suffolk, she regarded him as her best friend in England. But he was fast becoming a controversial figure, and the queen, who had a vigorous and passionate nature, fell into the blunder of regarding his allies, the Beauforts, as her allies, and his enemies, the dukes of Gloucester and York, as her foes. The result was that she quickly became involved in the party struggles herself; and the popular hatred of her was increased by the disasters in France and by her covetous and imperious behaviour. Perhaps inspired by her husband's example, she founded in 1448, with Andrew Docket, Queens' college, Cambridge; but as a childless queen her influence was limited, in spite of her talents and ambition. However, on Oct. 13, 1453, she bore her only son, Edward, and from that moment she threw all her tireless energies into the defense of his rights. To her indomitable spirit the cause of Lancaster owed much of its endurance; to her implacable determination it owed much of its failure.

It was her misfortune that a few months before her son was born her husband went mad. The natural head of the government in these circumstances was the duke of York whose ambitions Margaret suspected. By persistently treating him as a foe she finally made him one. By 1455 he was convinced that Margaret and the head of the Beauforts, the duke of Somerset, were plotting his destruction. The result was the first battle of St. Albans (May 1455), the death of Somerset, the capture of the king, and York's control of the government. But Margaret was tireless in opposition, and in 1456 succeeded in ousting him and his friends from the government. Thenceforward relations deteriorated until in 1459 the war for which both sides had been preparing broke out. After a Yorkist defeat at Ludlow Margaret embittered the struggle by a wholesale proscription of her opponents in the parliament of Coventry. When the Yorkists had won the battle of Northampton (July 1460), she refused to accept the compromise by which York was declared heir to the throne. Instead she sought help in Scotland, which lost her much support in England. She forfeited even more when, after the death of the duke of York at the battle of Wakefield (Dec. 1460), she marched south with wild Scottish and northern troops who pillaged even altar vessels. Hatred of her was increased by the vindictive executions which she instigated after the second battle of St. Albans (Feb. 1461). After the disaster of Towton in March no course was left but for her, with her son and husband, to take refuge in Scotland.

But she refused to accept defeat. A year later she went to France, obtained help for a temporarily successful expedition to Northumberland, but finally had to seek refuge in the family possessions in Bar. There young Edward was educated to be king of England. To this end Margaret was prepared in 1470 to be reconciled with her former bitter enemy, the earl of Warwick, and agreed to marry her beloved son to his younger daughter Anne; but she did not trust Warwick and after his success and Henry's restoration she still remained in France. At last on April 14, 1471, she was induced to land with her son at Weymouth, the very day that Warwick was killed by Edward IV's forces at Barnet. Her last hope was to reach Wales and there raise Lancastrian supporters, but Edward IV foresaw the danger and caught up with her army at Tewkesbury. In the crushing defeat of her forces there on May 4, 1471, her son was killed and she was captured; less than three weeks later her husband was murdered in the Tower of London. She was now a broken woman, with nothing left to live for. Louis XI ransomed her under the treaty of Picquigny in 1475 and she returned to France in Jan. 1476. She lived for six years in Bar and Anjou, in poverty and dependent for sustenance on Louis XI, who in return made her surrender her claims to her father's inheritance. She died near Saumur on April 25, 1482, and was buried in Angers cathedral.

Myers, in the *Bulletin of the John Rylands Library*, vol. 40 (1957-58) and vol. 42 (1959-60). (A. R. M.)

MARGARET OF FRANCE (MARGUERITE DE VALOIS) (1553-1615), queen consort of Navarre, famous as LA REINE MARGOT,

was born at St. Germain-en-Laye on May 14, 1553, the daughter of Henry II of France and Catherine de Médicis. From the moment when she took her place at court in 1569 she played a part in the Wars of Religion: her relations with her brothers, Charles IX and the duc d'Anjou (later Henry III of France), were often strained, and she had an early liaison with Henry, duc de Guise. On Aug. 18, 1572, she was married, in Paris, to the Protestant Henry de Bourbon, king of Navarre (the future Henry IV of France), in order to seal the peace between Catholics and Protestants; but six days later the massacre of St. Bartholomew's day began. Subsequently, refusing to be parted from Henry of Navarre, she promoted the understanding between him and her youngest brother, François, duc d'Alençon, a leader of the moderate Catholics. Her role in the ensuing conspiracies cost the life of her lover, the seigneur de La Môle (Joseph de Boniface), in 1574. Later Henry III of France banished her to the inaccessible castle of Usson in Auvergne (1586); but with Guise's help she made herself mistress of the place. The collapse of the League in Auvergne left her unable to maintain herself against her husband; but when he demanded the annulment of their childless marriage so that he could marry Gabrielle d'Estrées, she withheld her consent till Gabrielle was dead (1599). Henry then married Marie de Médicis (1600), but Margaret retained her royal title. Five years later she was allowed to return to Paris, where she lived in magnificent style, free to pursue her amours, till her death on March 27, 1615. Her brilliant *Mémoires* (composed at Usson c. 1595-96), her poems and her letters were edited by L. Lalanne (1858). She was naturally the idol of Brantôme, but many lampoons were written against her, notably *Le Divorce satirique*.

Williams, *Queen Margot*, 2nd ed. (1911); J. H. Mariéjol, *La Vie de Marguerite de Valois* (1928); G. Dodu, *Les Valois* (1934). (P. ER.)

MARGARET OF PROVENCE (c. 1220-1295), queen consort of Louis IX of France, was the eldest daughter of Raymond Berengar V (IV), count of Provence. She was married to Louis at Sens on May 27, 1234, and crowned the next day. Though the young king's mother, Blanche of Castile, had arranged the marriage, she was jealous of her daughter-in-law, whom she supervised strictly; Jean, sire de Joinville, tells several stories of Blanche's separating the royal couple, and Louis himself seems sometimes to have behaved brusquely to Margaret.

Margaret accompanied Louis on the seventh crusade (1248-54) and showed great courage at Damietta, reinspiring the crusaders after the defeat at Mansurah (Feb. 1250), where Louis was captured by the Muslims. Blanche died in 1252, and Margaret, after returning to France, tried occasionally to meddle in politics. Though she was usually checked by the king's intransigence, she may have done something to improve relations between Louis and Henry III of England, who in 1236 had married her sister Eleanor. On the other hand she resented the fact that her father, who died in 1245, had by his will of 1238 left Provence to her youngest sister Beatrice, who in 1246 was married to Charles of Anjou, a brother of Louis IX (see CHARLES I of Naples). After Louis IX's death (1270) she did all that she could to thwart Charles's ambitions. She survived Louis, to whom she had borne 11 children, by 25 years, dying near Paris on Dec. 21, 1295.

(M. PAC.)

MARGARET OF AUSTRIA, princesses who governed the Netherlands for their Habsburg kinsmen in the 16th century.

MARGARET OF AUSTRIA (1480-1530), duchess of Savoy from 1501, was born in Brussels on Jan. 10, 1480, the daughter of the Austrian archduke Maximilian (see MAXIMILIAN I, Holy Roman emperor), by his consort Mary of Burgundy. She was betrothed in June 1483 to the dauphin, later Charles VIII of France, but he repudiated her in 1491 and sent her back to the Netherlands in 1493. Next, in April 1497, she was married to the infante Don John of Aragon, heir apparent to the Spanish kingdoms; but in

Oct. 1497 he died. Finally, in Dec. 1501, she was married to Philibert II, duke of Savoy; on his death (Sept. 1504), she caused a splendid tomb to be built at Brou, in Bresse. After her brother Philip's death (1506), Maximilian in March 1507 named her regent of Netherlands for the infant Charles (see CHARLES V, Holy Roman emperor). She pursued a strongly pro-English policy and avoided hostilities against France till England, as well as Maximilian and Spain, undertook them. Charles was declared of age to rule in Jan. 1515, but reappointed Margaret to the government of the Netherlands by a series of acts of 1518-20. It was she who, with her sister-in-law Louise of Savoy, negotiated the "Ladies' peace" of Cambrai between Charles and the French king Francis I (1529). Margaret died at Mechelen in the night of Nov. 30-Dec. 1, 1530.

MARGARET OF AUSTRIA (1522-1586), duchess of Parma from 1550, was born at Oudenarde in Flanders in summer 1522, the natural child of the emperor Charles V and Johanna van der Gheenst. She was married on Feb. 29, 1536, to Alessandro de' Medici, duke of Florence, who was murdered in Jan. 1537. She was next married, in Nov. 1538, to Ottavio Farnese, whose claim (1547) to the duchy of Parma was allowed by the papacy in 1550 but obstructed by Philip II of Spain (the power occupying Piacenza) till 1556. In May 1559, however, Philip named Margaret governor general of the Netherlands. As the revolt of the Netherlands gathered strength, Margaret tried in vain to conciliate the nobility. When the duke de Alba arrived with a Spanish army (Aug. 1567), she offered her resignation. Philip soon accepted it, and she left Brussels for Italy in Dec. 1567. While her son Alessandro Farnese was commander in chief in the Netherlands, Philip in March 1580 entrusted Margaret with the civil administration there again; but in Dec. 1581 Alessandro was officially named governor general, and in July 1583 Margaret was finally relieved of her functions. She left for Italy again in Sept. 1583 and died at Ortona on Jan. 18, 1586.

See, for the elder Margaret, Jane de Iongh, *Margaret of Austria* . . . , Eng. trans. (1953); for the younger, F. Rachfahl, *Margaretha von Parma* . . . (1898).

MARGARET OF CARINTHIA (called MAULTASCH because her mouth [*Maul*] was like a pocket [*Tasch*]) (1318-1369), countess of Tirol, was the daughter of Henry, duke of Carinthia and count of Tirol. In Sept. 1330 she was married to the nine-year-old John Henry of Luxembourg, son of King John of Bohemia and younger brother of the future Holy Roman emperor Charles IV. On her father's death (1335) she inherited Tirol, but Carinthia had to be ceded to the house of Habsburg (1336). Her marriage, however, was unhappy, and the Tirolese disliked the way in which Charles governed the country for his brother; so she and the Tirolese estates expelled John Henry in 1341. The Wittelsbach emperor Louis IV the Bavarian upheld her, annulled her marriage on the ground of John Henry's impotence (Feb. 1342) and gave her instead to his own son Louis, margrave of Brandenburg, regardless of their being within the prohibited degrees of affinity. These proceedings infuriated at once the papacy (which ought to have been consulted about the new marriage) and the Habsburgs (who still coveted Tirol), as well as the aggrieved house of Luxembourg. The Tirolese also rose against their rulers, but Margaret withstood them till her husband had suppressed the rebellion. Finally Charles of Luxembourg, secure in the German kingship after Louis IV's death (1347), left Louis of Brandenburg in possession of Tirol. Louis, however, died in 1361, and his and Margaret's only son, Meinhard III, in 1363. Then the Habsburg Rudolf IV of Austria induced Margaret to cede Tirol to himself (Sept. 29, 1363). Retiring to Vienna, she died there on Oct. 3, 1369.

MARGARINE (OLEOMARGARINE) has been variously defined during its history. In the U.S. it is defined in the standard of identity promulgated under the federal Food, Drug and Cosmetic act as a plastic food prepared from one or more vegetable and animal fats intimately mixed with one or more variations of cow's milk together with table salt and several other permitted optional ingredients in small quantities. It may also be defined as a plastic, solid, fat food consisting of 80% (U.S. legal minimum) edible fat, which carries dispersed in it the balance of the

product, namely, an aqueous portion consisting primarily of skim milk and salt.

The ingredients in margarine, then, are those found in its edible fat portion and in its milk portion. The edible fats used have varied widely since the 1870s when the manufacture of margarine began, the trend having been from the animal fats predominantly in use earlier to the vegetable fats predominantly in use by the mid-20th century in the U.S.; these are principally cottonseed, soybean, peanut and corn oils. In European countries whale oil has been and is widely used, but it was never common in the U.S.

Usually there are such ingredients as vitamins A and D, vegetable lecithin, emulsifiers and similar materials dissolved in the liquid fats used in making margarine, while in the milk portion there are dissolved the salt and other ingredients readily mixable with milk. These two portions are then thoroughly mixed to produce an emulsion which is chilled to a solid, kneaded to a suitable mass and packaged.

Margarine was developed in the late 1860s by the French chemist Hippolyte Mège-Mouriès, who not only received recognition for his achievement in France and other European countries, but was also granted a U.S. patent in 1873. Out of Mège-Mouriès' early experience and process, which was unduly complicated, there grew the generally simple process in the 1870s and 1880s in the U.S. of churning the melted margarine fat blend with milk and salt, solidifying the churned mixture by chilling with cold water, working mechanically (kneading) the chilled mass to a plastic consistency and packaging, all by means of typical butter-working equipment of the time.

Primarily as a result of the efforts of competitive industries, margarine was subjected in the United States and elsewhere to severe restrictive legislation. The Oleomargarine act of 1886 was the earliest significant U.S. legislation on the subject. This law, together with subsequent amendments to it (1902, 1930), imposed a prohibitive tax on yellow margarine, levied high licence fees on all manufacturers, wholesalers and retailers of the product, and in other respects subjected the manufacture and sale of this food to numerous restrictions. The result was not only to prevent margarine from reaching its normal consumption level but for a very long time to prevent the sale of any yellow margarine. There was also a wave of similar state legislation, in which practically every state took part.

An important development in margarine processing occurred in the mid-1930s. Before that time, most vegetable fat margarine was made from imported oils, such as coconut, palm and palm kernel oils. While these oils were perfectly wholesome, the anti-margarine groups used this situation to support the continued restrictions on margarine and even to advocate additional ones on the basis that such use of foreign oils was inimical to the best interests of the U.S. farmer. After considerable research, manufacturers of margarine in the U.S. finally found in the mid-1930s how to make a satisfactory margarine from domestic vegetable oils. The resultant increase in the use of cottonseed and soybean oils stimulated the interest of cottonseed and soybean farmers and processing groups in the elimination of discriminatory restrictions on margarine; in the 1940s consumer groups in the U.S. also became interested in the elimination of this legislation.

The efforts of domestic, agricultural and consumer groups to have margarine freed from what they considered unfair legislation have culminated in success in 1950, when congress repealed all the federal taxes and licence fees on margarine made in the U.S. This action was followed by similar action of state legislatures, and within a relatively short time thereafter, most of the state prohibitions against yellow margarine were repealed.

In addition to the development of the use of domestic vegetable fats in margarine, other improvements by modern scientific methods were made. In 1923 it was first fortified with vitamins A and D. In 1941, following extensive public hearings, the United States Food and Drug administration established a definition and standard of identity for margarine which, in turn, were revised and brought up to date in 1952. This standard prescribed the mandatory and the optional ingredients to be used in the manufacture of margarine, and served not only as government recognition of the

wholesomeness of the product, but also as a protection to the consumer. As a result of these developments and other scientific advances, margarine has been accepted by the U.S. public to an extent comparable with its acceptance in many European countries.

Nutritionally, the value of margarine as a food fat is primarily as a source of food fuel (calories) and of other nutritional factors. From the early 1950s, all margarine manufactured in the U.S. was fortified with at least 15,000 U.S.P. units of vitamin A to the pound. In the late 1950s (mostly 1956–60) there developed an increased interest in the relation of polyunsaturated fat to health. This resulted in a marked shift in the fat ingredients of margarine to include such fats (see OILS, FATS AND WAXES: *Physical and Chemical Properties and Hydrogenation*).

MARGARITA, CLEMENTE SOLARO, CONTE DELLA (1792–1869), Piedmontese statesman who stood for the old order during the Italian Risorgimento, was born at Mondovì on Nov. 21, 1792. He entered the diplomatic service of Sardinia-Piedmont in 1816 and went to Naples. From 1826 to 1834 he was minister plenipotentiary in Spain. He was appointed minister of foreign affairs by King Charles Albert in 1835.

Della Margarita's policy was to keep his country neutral, avoiding alliance either with France or with Austria. In home affairs he protected the church and refused to support liberal reforms. When agitation for constitutional reform grew too strong, Charles Albert dismissed him in Oct. 1847.

Della Margarita, whose *Memorandum storico-politico* (1851) was an apology for his administration, opposed projects for a united Italy as he felt that the sacrifice of Piedmontese independence was too great a price to pay. From 1854 to 1860 he was deputy for San Quirico in the Piedmontese parliament and led the clerical opposition to Cavour. Not elected to the first parliament of the new kingdom of Italy, he retired from politics in 1860 and died in Turin on Nov. 12, 1869.

See M. Monaco, *Clemente Solaro della Margarita* (1955).

MARGARITA ISLAND (ISLA DE MARGARITA), also known as the Isle of Pearls, is the largest of 70 islands making up the state of Nueva Esparta (q.v.) in Venezuela, and is about 12 mi. N. of the peninsula of Araya. Of the 89,492 persons in the state in 1961, nearly 75,000 were on the island. Margarita is about 40 mi. long from east to west, has an area of 414 sq.mi. and a coast line of 198 mi., with many natural harbours. It is in reality two islands joined by a low, narrow isthmus. The highest elevation on the island is the peak of Macanao, 2,493 ft. After 1950 the government enlarged its road-building program, and in 1957 the official claim was that the island had 200 mi. of improved roads. There is an airport at Porlamar. Water is a fundamental problem of the island population; drinking water is brought from the mainland. Farming and grazing is carried on but the island is a net importer of foodstuffs.

La Asunción (pop. [1961] 5,541), on the eastern end of the island, is the capital of the state. It was founded in 1524 by Marcelo Villalobos. Porlamar (pop. [1959 est.] 22,763), is the most important city. It is the centre of a pearl fishing industry that dates back to the early 16th century and which is closely controlled by the government in order to guarantee its continuance. Pampatur (pop. [1959] 1,823), the leading port, is located on a protected bay. Juangriego (pop. [1959] 4,718), located on the north side of the island, is a major fishing centre; its canned

products are sold throughout the nation.

Tile and ceramics are manufactured on the island. Shoes and hats made from sisal, produced locally, have a national market. The building of fishing boats is an established industry, as is the manufacture of salt. After World War II Margarita won favour as a tourist area.

The island of Margarita was discovered by Columbus in 1498 on his third voyage. The pearl industry of Margarita and the surrounding islands sprang up soon thereafter. The life span of the Indian divers was short and the raiding of the mainland for replacements led to bloody reprisals by the natives. In 1561 the crazed Lope de Aguirre ravaged the island before menacing the mainland. Fifteen years later (1576) it was visited by British pirates. In 1662 Pampatur was razed by the Dutch. For a long time Margarita was attached to Cumaná, but in the 18th century it was made administratively independent. Its traders rendered invaluable assistance to the revolutionists in the wars of independence; Simón Bolívar used the island as a base of operation in 1816, and the Spanish general Pablo Morillo was driven from its shores in 1817. In recognition of its contribution to the independence movement Margarita, with the surrounding smaller islands, was renamed Nueva Esparta ("New Sparta").

The population of Margarita is predominantly indigenous; the Spanish ancestry is traceable chiefly to the Canary Islands. Since 1920 the island has attracted immigrants from abroad, but at the same time many islanders have migrated to the mainland in search of favourable employment. There are on the island a *liceo* (high school) and three institutions which provide commercial instruction. (J. J. J.)

MARGATE, a municipal borough and seaside resort of Kent, Eng., lies at the southeast end of the Thames estuary 16 mi. N.E. of Canterbury by road. Pop. (1961) 45,708. During the summer it is served by pleasure steamers from London. The municipality owns 9 mi. of sea front with its fine sands, and has built promenades along almost the whole distance, which includes Cliftonville and Westbrook, Westgate-on-Sea and Birchington and provides concert pavilions and winter gardens, tidal bathing pools and many other means of recreation for the huge influx of summer visitors who provide the town's chief source of income. The jetty is 1,240 ft. long and the pier 760 ft. There is a small harbour and some fishing is carried on. A large industrial estate for light industry has been developed south of the town.

Margate was originally known as St. John's, Thanet, and the flint church of St. John the Baptist, founded in 1050, contains some portions of Norman architecture and many brasses. The port was an ancient and senior noncorporate limb of Dover, and at the time of the siege of Calais it contributed 15 ships of small tonnage. A pier existed before 1500 but, the amount of grain shipped being small, the *droits* (dues) were insufficient to keep it in repair. In 1750 Margate became known as a bathing place with fine sands and in 1777 the pier was rebuilt. The stone pier, badly damaged in the storms of 1953 when the harbour light (1829) was destroyed, has been repaired. In 1835 the town was still a liberty of Dover and no right of citizenship could be acquired. In 1857 it was incorporated, and the borough was extended to include the resorts of Westgate-on-Sea, Birchington and the parish of Garlinge in 1935. Margate suffered considerably from air raids and cross-channel bombardment in World War II. The early 15th-century gateway of the manor house of Daundelyon, now Dent-de-Lion farmhouse, remains between Margate and Westgate. The foundation of a Roman villa was discovered at Tivoli, south of Margate, in 1924. At Quex park is the Powell-Cotton museum of natural history and ethnography.

MARGAY (*Felis wiedii*), an American wildcat found from far southwestern Texas to Paraguay, east of the Andes. It is 2 ft. long, with tail 18 in., resembling the larger ocelot in colour, but with more elongate spots and a longer tail. The head is more rounded. The name tiger cat is applied loosely to the margay and several other American wildcats. (J. E. H.L.; X.)

MARGELAN, a town in the Fergana oblast of the Uzbek Soviet Socialist Republic, U.S.S.R., is situated in the southwest of the Fergana valley 1½ mi. from Gorchakovo station on the

Andizhan-Kokand railway and 5 mi. N. of Fergana city. Pop. (1959) 67,990. It has been celebrated for its silk since the 10th century and is now the most important silk spinning and weaving centre in the U.S.S.R. Margelan is famous for a type of brightly coloured iridescent silk used for women's clothes all over central Asia. It was called Stary (Old) Margelan (1876–1907) as opposed to Novy (New) Margelan (subsequently renamed Fergana).

(G. E. Wz.)

MARGGRAF, ANDREAS SIGISMUND (1709–1782), German chemist whose name is especially associated with the discovery of sugar in beetroot, was born at Berlin, March 3, 1709. He studied chemistry at Berlin and Strasbourg, medicine at Halle, and mineralogy and metallurgy at Freiberg, and returned to his native city in 1735 as assistant to his father, who was chief apothecary at the court. In 1738 he was elected to the Berlin Academy of Sciences, which in 1754 put him in charge of its chemical laboratory and in 1760 appointed him director of its physics class. He died in Berlin, Aug. 7, 1782. Marggraf's discovery of beet sugar in 1747 led to development of the beet sugar industry. He introduced the microscope as an aid to chemical inquiry and used this instrument to detect the presence of minute sugar crystals. In another research dealing with the nature of alum, he showed that one of the constituents of that substance, alumina, is contained in common clay, and that it is quite distinct from lime. He explained and simplified the process of obtaining phosphorus from urine, and made some observations on phosphoric acid; but though he noted the increase in weight that attends the oxidation of phosphorus he remained an adherent of the phlogistic doctrine. For his time he was a skilful chemical analyst.

His papers were presented to the Berlin academy, and with the exception of a few of the latest were collected in two volumes of *Chymische Schriften* in 1761–67.

MARGHILOMAN, ALEXANDRU (1854–1925), Rumanian statesman noted for his role in World War I, was born at Buzău on July 4, 1854. After studying law and political science in Paris he returned to Rumania and was elected deputy in 1884. He first became a member of the government in 1888. One of the Junimist group of young conservatives, Marghiloman believed that Rumania's interests demanded co-operation with Germany and Austria-Hungary; but on the outbreak of war in 1914 he advocated neutrality. In 1916, as leader of the Conservative party, he was offered a seat in Ion Brătianu's cabinet, but he refused it because he could not endorse Rumania's declaration of war on the Allied side. He remained in Bucharest during the German occupation and, as president of the Rumanian Red Cross, was able to act as mediator between the occupying authorities and the population. He rejected German proposals that, in order to conclude peace, he should form a government in Bucharest, in rivalry to King Ferdinand's government in Iași. After Rumania's surrender in March 1918, however, he went to Iași and at the king's request took office as prime minister to sign a peace treaty with the Central Powers (May 7, 1918; never ratified). His cabinet fell on Nov. 8, 1918, with the defeat of the Central Powers, and he played no further part in Rumanian politics. He died at Buzău on May 10, 1925. His memoirs appeared in 1927.

(B. Br.)

MARGIN, a term in finance meaning the amount by which the value of collateral provided as security for a loan exceeds the amount of the loan. This excess represents the borrower's equity contribution in a transaction that is partly financed by borrowed funds; thus it provides a "margin" of safety to the lender over and above the collateral that is pledged. The size of the margin that is required varies with the type of collateral, the stability of its market price, expectations with regard to its future price and the credit standing of the borrower.

The term margin is used especially in connection with transactions in securities and commodity futures. When securities are purchased "on margin" the buyer supplies only a percentage, or margin, of the purchase price and borrows the remainder from his broker, pledging the security as collateral for the loan. A fall in the price of the security subsequent to the purchase reduces the margin available to the lender and the customer may be called upon to restore his margin to a prearranged level. This level is

determined by the lending broker, but may not be below minimum levels stipulated by the organized exchange in which the transaction takes place.

In addition, minimum initial margin requirements on loans made for the purpose of purchasing securities are required in the United States by the federal reserve board under authority granted by the Securities Exchange act of 1934. The purpose of the margin requirement is to prevent excessive use of credit for speculation in stocks. Dealings on margin are not allowed on British stock exchanges.

(Ea. S.)

MARGINAL GROUPS. This term is used in two ways by sociologists: one refers to certain racially mixed groups; the other to a group leaving one cultural background but not yet accepted by a second cultural community. In societies throughout the world there are people of mixed or uncertain genetic origin who are not recognized as members of the dominant racial group and who refuse to accept racial classification among a socially subordinate group, or minority. These become the "marginal groups." Ohio State university sociologist and anthropologist Brewton Berry, author of *Almost White* (1963), has identified the Melungeons (in Tennessee), the Guineas (West Virginia), the Jackson Whites (New York–New Jersey), the Keating Mountain group and the Pools (Pennsylvania), the Croatans (Georgia and the Carolinas), the Dominickers (Florida) and other groups throughout the U.S. south and in New England. In other countries there are the métis in Canada and the mestizos (*q.v.*), or cholos, in Bolivia, Colombia, Ecuador and other Latin-American countries.

Commonly in the United States, a Negro is socially defined as anyone who has any known trace of Negro ancestry, despite the many legal definitions that specify one-fourth or one-eighth Negro ancestry as defining a Negro (*see* NEGRO, AMERICAN). With the extensive intermingling that has gone on for over 350 years in North America, practically all socially defined Negroes have varying degrees of admixture of white ancestry, and a great number have some American Indian ancestry. Appearance is not a perfect guide, either to the actual amount of genetic intermingling or to the public acceptance of a given person as being of a specific race. Only one thing is certain: if a community defines a person as a Negro, he is treated as a Negro.

The phenomenon of *group self-hatred* is well known among certain minority groups who are considered as proper objects for prejudice and discrimination by the majority group (*see* MINORITIES). That is, there are individuals who despise themselves because they are members of despised minorities, yet they cannot break away from the group because of their physical appearance, their social obligations or their public identification. Some of the American Negroes who have group self-hatred also have been living together as a group in the same community for many generations. They have developed distinctive traditions and a way of life characteristic of a community of people living together and more or less isolated from the larger society over a period of time. One of their most important characteristics is their group self-hatred, which manifests itself in a vigorous denial that they are Negro. In one important way they are right, since they are not predominantly Negro in a scientific, biological sense. But they are partly Negro, and are socially defined as Negro by the majority of the population, and of these things they are very much aware. They are thus marginal—accepted neither by whites nor by Negroes, while they themselves refuse the racial identification which both of the other groups give them as Negroes.

Another such group is the Cajuns of Louisiana and Alabama. They claim ancestry, probably accurately, from the French Acadians (Cajun is a corruption of Acadian) who were driven out of Canada by the English in the 18th century and who took up residence in the French colony of Louisiana. What they fail to acknowledge is that their French ancestors amalgamated with Negroes and probably also with American Indians. They insist that they have pure Caucasoid ancestry, which neither the whites nor the Negroes of their communities accept. So the Cajuns live an isolated existence: the whites will not associate with them, and they will not associate with the Negroes. What makes their situation ironic is that many of the French-descended "whites" of

Louisiana who call themselves "Creoles" also have some admixture of Negro ancestry. But the Creoles have managed to get themselves publicly identified as white, while the Cajuns have not.

The Croats of Georgia and the Carolinas are another such group, with ancestry predominantly a mixture of Indian and Negro. They reject a Negro ancestry and insist on being called Indians. The whites and the Negroes in their communities know of their Negro ancestry, but because of their aggressive refusal to be treated like the other Negroes, they occupy a distinctive, but segregated, position in the community. In other nations where race identifications are very important socially (as in South Africa and Southern Rhodesia) the mixed bloods are accorded a legal status, as "Coloureds," different from that of the pure-blooded Negroes, and therefore have a recognized, though inferior, position in the society (see CAPE COLOURED). In the United States, where practically all Negroes are mixed bloods and where the dominant whites identify anyone with any known Negro ancestry as Negro, the mixed bloods must either identify themselves as Negro or else become a "marginal group"—calling themselves something which nobody else recognizes to be true.

Marginal groups have also been defined by sociologists Robert E. Park and Everett Stonequist to be those in transition between two cultures, regardless of their genetic characteristics. Members of an immigrant group, for example, having abandoned the society of their ancestors, are still not fully accepting of, or accepted in, the host society into which they have moved. The character of being marginal is even more keenly defined for the children, who feel completely alienated from the society of their ancestors but are still not fully accepted into the society where they now dwell. The main studies of these "marginal men" have been among the offspring of European immigrants to the United States, but the problem has been observed, too, among migrants from the rural south to the industrial cities of the north, where they have been disparagingly classified as "hillbillies." Group self-hatred usually characterizes these cultural marginal groups just as it does the racial ones. In all cases, they are between two larger groups, but part of neither.

MARGOLIOUTH, DAVID SAMUEL (1858-1940), British Arabic scholar who enjoyed an almost legendary reputation among the Islamic peoples and the oriental scholars of Europe, was born in London on Oct. 17, 1858, the son of an Anglican missionary to the Jews. Educated at Winchester and New college, Oxford, he devoted himself to Arabic studies and in 1889 became Laudian professor of Arabic at Oxford. He took an active part in the Royal Asiatic society, was awarded its triennial gold medal in 1928 and was its president, 1934-37. He held many other honours. In addition to several works on the history of Islam, which became the standard English treatises on the subject, he edited and translated many important Arabic texts, including the *Letters of Abu al-'Ala* (1899), Yakut's *Dictionary of Learned Men*, six volumes (1907-27) and (with H. F. Amedroz) *The Eclipse of the 'Abbasid Caliphate*, seven volumes (1920-21). He died in London on March 22, 1940.

See the *Proceedings of the British Academy*, vol. xxxvi (1940).

MARGRAVE (Ger. MARKGRAF), originally the count (q.v.) at the head of a mark or march, one of the great military zones of command established by Charlemagne and his successors on the frontiers of the Frankish empire; e.g., the Breton march, the Spanish march, the march of Gothia, the march of Friuli. The German kings of the Saxon dynasty, Otto I, Otto II and Otto III, created a new system of marks in the 10th century, giving particular attention to their eastern frontier. A margrave was expected not only to secure the frontier but also to push it forward into Slav or pagan territory, as did Gero, the Billungs, the margraves of Meissen and Albert I the Bear (qq.v.). Some of the margraves

grew into hereditary principalities; thus the Bavarian Ostmark became the duchy of Austria, the Steiermark became the duchy of Styria, the Saxon Nordmark became the electorate of Brandenburg. Later, however, the margraves of Baden were so styled simply because their ancestor had held the mark of Verona in 11th-century Italy; the Hohenzollern margraves of Ansbach and of Bayreuth likewise echoed their ancestor's title to Brandenburg.

(C.-E. P.)

MARGUERITE, the popular name for several plants of the family Compositae, especially *Chrysanthemum frutescens*, a shrubby perennial with smooth leaves cut pinnately into narrow segments and flower heads two or three inches across produced singly in summer and autumn on slender erect stalks. The ray florets, which may be white or pale yellow, surround a yellow disk. It is a native of the Canary Islands, and a favourite for decoration and for greenhouse cultivation, window boxes and open ground in the summer. The golden marguerite or yellow camomile (*Anthemis tinctoria*) has golden yellow flowers and somewhat woolly stems and leaves. The plant is propagated from cuttings taken in autumn from old plants and placed in sandy loamy soil in cold frames. In England marguerite, moon-daisy or oxe-eye daisy indicates *Chrysanthemum leucanthemum*. The African subshrub *Felicia amelloides*, known in cultivation as blue daisy, is also called the blue marguerite. In France *la marguerite* is applied to the common daisy (q.v.).

MARGUERITTE, PAUL (1860-1918) and **VICTOR** (1866-1942), French novelists, both born in Algeria, where their father, Gen. Jean Auguste Margueritte (1823-1870), who later distinguished himself at the head of the 1st Cavalry division and met his death near Sedan in Sept. 1870, was commanding a garrison. Paul, who was born at Laghouat on Feb. 1, 1860, recalled his Algerian childhood in *Le Jardin du passé* (1895). Educated at the free school for officers' sons at La Flèche, he worked at the ministry of education from 1881 to 1887. He published his first book, *Mon Père*, in 1884 and was originally one of the Naturalist group of writers, but broke with them when he signed the manifesto of "the Five" against Émile Zola's *La Terre* in 1887. He had already published *Tous quatre* (1885), *La Confession posthume* (1886) and *Maison Ouverte* (1887); there followed *Pascal Gêfosse* (1887), *Amants* (1890), *La Force des choses* (1890), *Sur le Retour* (1892), *Ma grande* (1892), *La Tourmente* (1894), *Âme d'enfant* (1894) and *L'Eau qui dort* (1896). In 1896 he began his collaboration with his younger brother Victor (born at Blidah on Dec. 1, 1866), who, after serving as a lieutenant in a dragoon regiment, left the army to devote himself to literature. The two brothers published jointly *Pariétaire* (1896), *Poum, aventures d'un petit garçon* (1897) and *Une époque*, a series of four novels on the events of 1870-71, comprising *Le Désastre* (1898), *Les Tronçons du glaive* (1901), *Les Braves Gens* (1901) and *La Commune* (1904). Besides these historical novels, they wrote novels on moral questions and pamphlets on marriage and the emancipation of women, including *Femmes nouvelles* (1899), *Deux vies* (1902) and *Le Prisme* (1905). Their collaboration ceased in 1907.

Paul Margueritte was one of the first members of the Académie Goncourt, having been nominated for a seat in Edmond's will (see GONCOURT). Among his later books were *Souvenirs de jeunesse* (1906-08), *La Flamme* (1909), *La Faiblesse humaine* (1910), *L'Embusqué* (1916) and *Jour* (1918). He died at Hossegor (Landes) on Dec. 30, 1918.

Victor published by himself *La Prostituée* (1907), *Jeunes filles* (1909), *La Garçonne* (1922) and *Ton corps est à toi* (1927). The last two provoked an indignant moral outcry, as also, for different reasons, did his books on the war, *Les Criminels* and *Appel aux consciences* (both 1925). He died at Monestier, Isère, on March 23, 1942. (R. DL.)

MARI, an ancient Syrian city marked by the site of TALL HARIRI, was situated on the right bank of the Euphrates about 7 mi. N.N.W. of Abu Kemal near the frontier with Iraq. Excavations directed by A. Parrot were initiated in 1933 and were still in progress in the 1960s. The periods at which the city was occupied range from the Parthian and Sasanian (2nd century B.C.—

7th century A.D.) through the Neo-Babylonian and Assyrian back to Hammurabi, 18th century B.C., when the place, ruled over by a local king named Zimri-Lim, enjoyed a glorious period of prosperity for about 30 years. It was then destroyed by the Babylonians who, after defeating Rim-Sin of Larsa, deemed it necessary to control the important trade routes which ran along this stretch of the middle Euphrates.

A series of buildings, many of them on a grand scale, were continuously re-erected between 3000 and 2000 B.C. They include a ziggurat, temples to Ishtar, Nin-har-sag and Dagan. Remains of the Jamdat Nasr period (c. 3100 B.C.) have also been found, and still earlier occupations probably remain to be discovered.

Associated with the temples was an important series of statuary in alabaster and calcite, of the period known as Early Dynastic III, mostly inscribed with Semitic names of kings, viziers, priests and other dedicants. It is, however, the great palace at Mari, founded in the 19th century B.C., which has been the most remarkable of the many discoveries at that site. It occupied an area of about five acres and contained nearly 300 rooms within which were concentrated all the most important administrative offices. The royal apartments and the approaches to the throne room were decorated with painted murals, of which the most striking was a huge "canvas"—a painting in mud plaster which depicted the king being invested with the royal insignia from the goddess Ishtar. Many hundreds of small objects were found as well as some splendid statuary of which the most remarkable was a lifesize figure of a goddess holding a vase, so arranged that the life-giving waters could be poured through her and issue from a vase held between her hands. Nothing however was more valuable than the discovery of many thousands of archives in various scribal chambers. These consisted of diplomatic correspondence and reports sent in from all parts of the realm, as well as historical archives and letters exchanged between King Shamshi-Adad I of Assyria and his two sons shortly before 1800 B.C. Economic and legal texts were also abundant, and dispatches from local governors have added greatly to the knowledge of Syrian and Assyrian geography. These documents, of which many hundreds have already been published, give a graphic picture of life at this period, both of the town dwellers and of the Bedouin.

Parrot and G. Dossin (eds.), *Archives royales de Mari*, vol. i (1950). (M. E. L. M.)

MARIA, the name of two queens of Portugal.

MARIA I (1734–1816), queen of Portugal from 1777 to 1816, was born in Lisbon on Dec. 17, 1734, the daughter of the future king Joseph I. In 1760 she married her uncle who, as king consort after Maria's accession (Feb. 1777), was styled Pedro III. Her prosperous and peaceful reign followed the dictatorial administration of the marquis de Pombal, part of whose handiwork she repudiated. A treaty of alliance was signed with Spain (1778), after an agreement to map the common frontier in South America. Deaths in the royal family in 1786 and 1788, combined with news of the excesses of the French Revolution, so affected Maria that she became mentally deranged. Her third surviving son and heir apparent (afterward John VI) assumed power in Feb. 1792 for the duration of his mother's illness, and when this was declared incurable, became regent (1799). Maria accompanied the court to Brazil in 1807 and died in Rio de Janeiro on March 20, 1816.

MARIA II (1819–1853), queen of Portugal from 1834 (regarded by some as queen from 1826) to 1853, was born in Rio de Janeiro on April 4, 1819, the daughter of Pedro, eldest surviving son of John VI. When John died (1826), Pedro, already emperor of Brazil, succeeded to the Portuguese throne but quickly made a conditional abdication in favour of Maria, the proviso being that she should marry her uncle, Dom Miguel (q.v.). However, before Maria arrived in Europe (Sept. 1828), Miguel had renounced his allegiance to her and to Pedro and had been proclaimed king. As a result, Maria did not actually become queen until 1834 when Miguel was defeated (see **PORTUGAL: History**). Her reign was characterized by the continuing struggle between liberals and conservatives, and by foreign intervention. Maria married in 1835

Augustus, duke of Leuchtenberg, who died the same year, and in 1836, Ferdinand of Saxe-Coburg, by whom she had 11 children. She died in Lisbon on Nov. 15, 1853.

(M. Ca.)

MARÍA CRISTINA, the name of two queens of Spain.

MARÍA CRISTINA I (1806–1878), queen consort of Ferdinand VII from 1829 to 1833 and queen regent from 1833 to 1840, was born at Naples on April 27, 1806, the daughter of Francis I, king of the Two Sicilies. Spanish liberals hoped that her marriage to Ferdinand would moderate the persecution to which they were subject, and this hope was in fact realized whenever the queen exercised political power. In 1830, the queen being pregnant, Ferdinand VII confirmed the *pragmática* issued in 1789, which re-established the right of females to succeed to the throne in default of male heirs. This was opposed by supporters of the claims to the succession of the king's brother, Don Carlos (1788–1855). Within a few days of the death of Ferdinand VII (1833), when María Cristina was named regent during the minority of her daughter Isabella, the first Carlist War began. The war was terminated only by the convention of Vergara in 1839 and by this time María Cristina had lost much support because of her morganatic marriage with Fernando Muñoz. She resigned her regency in 1840 and went to Marseilles, but returned to Spain in 1843, after Gen. Ramón Narváez's *coup d'état*. Isabella II was then declared of age and María Cristina again took part in political life, but she was forced to go into exile again in 1854. She died at Saint-Adresse in France on Aug. 23, 1878.

(R. S. L.)

MARÍA CRISTINA II (1858–1929), queen consort of Alfonso XII from 1879 to 1885 and queen regent from 1885 to 1902, was born at Gross Seelowitz on July 21, 1858, the daughter of the archduke Charles Ferdinand of Austria. She married Alfonso XII on Nov. 29, 1879. He died on Nov. 25, 1885, leaving her two daughters and a posthumous son, born on May 17, 1886, who immediately succeeded to the throne as Alfonso XIII, under the regency of his mother. María Cristina discharged her long and difficult regency with a tact and dignity that won general respect even though the war of 1898 against the United States was a disaster for Spain. She contributed greatly to the strengthening of the monarchy, to the appeasement of political struggles and to the steady, though slow progress of Spain from the lowest point of its decadence. After Alfonso XIII's coming of age (May 17, 1902), María Cristina devoted the remainder of her life to social and charitable work. She died in Madrid on Feb. 6, 1929.

(R. M. N.)

MARIANA, JUAN DE (1536–1624), Spanish historian and Jesuit whose chief work, the *Historiae de rebus Hispaniae*, is esteemed for its learning and its flowing prose style, was born at Talavera. In 1561 he went to teach theology in Rome, to Robert Bellarmine (q.v.) among others, then passed into Sicily, and in 1569 was sent to Paris, where his expositions of the writings of Thomas Aquinas attracted large audiences. He returned to Spain in 1574.

The *Historiae de rebus Hispaniae* first appeared in 25 books at Toledo in 1592; ten books were added (1605), and the author completed it to the accession of Philip IV in 1621. Mariana later translated it into Spanish (1601). Of his other writings the most interesting is the treatise *De rege et regis institutione* (1599; Eng. trans., *The King and The Education of The King*, 1948). Mariana's conclusion in this work that it may be lawful to overthrow a tyrant brought much odium upon the Jesuits, especially after the assassination of Henry IV of France in 1610. Mariana died in Toledo on Feb. 16, 1624.

See G. Cirot, *Études sur les historiographes espagnols: Mariana, historien* (1905); J. Laures, *The Political Economy of Juan de Mariana* (1928).

MARIANA ISLANDS, a series of volcanic mountain peaks and uplifted coral reefs in the Pacific ocean forming a chain from Guam to Japan, extending from latitude 12° to 21° N. and longitude 144° to 146° E. They are divided politically into Guam, a territory of the United States (see **GUAM**), and the islands north of Guam which are part of the United States Trust Territory of the Pacific Islands, administered as a trusteeship from the United Nations since 1947. The northern Marianas have a total area of

approximately 184 sq.mi. of which 47 are on Saipan, 39 on Tinian and 33 on Rota. The climate is mild, tropical and frost-free. On Saipan temperatures range from 21° to 29° C. (70° to 85° F.) and the annual rainfall averages 82 in.

The northern Marianas had a population of 8,290 in 1958 with the Rota district, administrated by the interior department since 1951, having a population of 969 and the Saipan district, administrated by the U.S. navy since 1953, having a population of 6,654. The population is descended from the pre-Spanish Chamorros with considerable intermingling of Spanish, Mexican, Philippine, German and Japanese blood. Spanish cultural traditions are strong.

After Ferdinand Magellan's discovery in 1521, the Mariana Islands were visited frequently but not occupied permanently by the Spanish until 1668. The name was changed from Ladrões Islands (Islands of Thieves) to Mariana Islands to honour Queen Marie Anne (Mariana), then regent of Spain. Guam was ceded to the United States following the Spanish-American War and the northern Marianas were sold to Germany in 1899. They were occupied by Japan in 1914 and became a Japanese mandate from the League of Nations until seized by the United States in World War II.

The economy is largely self-sufficient agriculture with some income from copra and services to military bases. (C. A. Mr.)

MARIANAO, a city in Havana province, Cuba, adjacent to the western city limits of Havana. It is situated in a slightly hilly section along the northern coast. Although founded in 1726 it did not grow much until after 1900. Having only 9,000 inhabitants in 1907 it then grew extremely rapidly as a residential and industrial suburb of Havana; its 1953 population was 219,278. Exclusive residential sections have been developed near Marianao beach and in the country club area. The principal manufactures are beer, pharmaceuticals, paper products, cloth and tobacco. The chief military encampment of Cuba, Camp Columbia, is in Marianao.

(D. R. D.)

MARIANISTS (SOCIETY OF MARY; SOCIETAS MARIAE; S.M.), a religious congregation of the Roman Catholic Church founded by William Joseph Chaminade at Bordeaux, France, in 1817, and canonically approved Aug. 11, 1865. The congregation comprises about 3,200 clerical and lay members—in 11 provinces throughout western Europe, the Americas, Asia, Africa and Australia—engaged primarily in Christian education. It is governed by an elected general superior, resident in Rome. American Marianists constitute 45% of the total membership, in four provinces centring at Dayton, O., St. Louis, Mo., Santa Cruz, Calif., and Chester, Pa.

(J. A. EL.)

MARIANSKE LAZNE (Ger. **MARIENBAD**), a small spa in the West Bohemia region, Czech., lies on the edge of the wooded Císarský Les hills, 39 km. (24 mi.) S.W. of Karlovy Vary. Pop. (1961) 16,456. The mineral springs which made it famous as a spa were long the property of Tepl abbey (12th century) about 14 km. (9 mi.) from the town. Josef Nehr, the abbey's doctor (1779–1820), demonstrated the therapeutic properties of the peat and springs. The settlement took its German name, Marienbad, in 1808 and received its town charter in 1868. Special features of the springs are the high iron content of the *Ambrozuv pramen* (spring) and the strength of the alkaline-saline waters of the *Křizový pramen*. In the last years of the Austrian empire the popularity of the cures and the beauty of the surroundings attracted wealthy visitors from all over Europe; the spa is now a centre for international congresses and symposia. (H. G. S.)

MARIANUS SCOTUS (originally named MOEL-BRIGTE, "Servant of Bridget") (1028–1082), Irish monk whose Latin chronicle, written in Germany, is notable for its challenge to the traditional calendar. Born in Ireland, he became a monk in 1052 and was taught by Tigernach, abbot of Clonmacnoise. Soon, however, he began to travel. He was in Cologne in 1056 and went from there to Paderborn and then to Fulda. Ordained priest at Würzburg in 1059, he returned at once to Fulda to be walled up as a recluse. In 1069 he was summoned to Mainz; but there he was again walled up. He died there on Oct. 22, 1082. He is not to be confused with the Marianus Scotus who died in 1081 as abbot of St. Peter's in Regensburg.

Marianus wrote a universal chronicle to 1082, the first part of which, down to 1073, is extant in his manuscript. Its main interest lies in its chronological calculations; Marianus maintained that Dionysius Exiguus, whose Easter tables determine the Christian calendar, dated the birth of Christ 22 years too early. Book iii of the chronicle is edited by G. Waitz in *Monumenta Germaniae Historica*, series *Scriptores*, vol. v and xiii (1844, 1881).

See A. D. von den Brincken, "Marianus Scotus," in *Deutsches Archiv*, 17 (1961). (K. RE.)

MARIA STELLA (1773–1843), Italian adventuress who claimed to be a French princess of the house of Bourbon-Orléans, was born at Modigliana, near Forlì, on April 16, 1773, and registered as the daughter of Lorenzo Chiappini, constable of Modigliana, and his wife Vincenzia Viligenti. Trained as a singer and dancer, she went on the stage in Florence. She was married in 1786 to Thomas Wynn, 1st Baron Newborough, who died in 1807; and in 1810 to a Russian count, Edward Ungern-Sternberg.

When Lorenzo Chiappini died in 1821 he left a letter stating that Maria Stella's real father was not he but a nobleman who had exchanged her for Chiappini's son and had later died. Finding that in 1773 a couple traveling under the name of comte and comtesse de Joinville had been at Modigliana, Maria Stella built up the story that these two were the duc and duchesse de Chartres (Louis Philippe Joseph, later duc d'Orléans and named Louis Philippe Égalité, and his wife Adélaïde de Bourbon-Penthièvre) and that the duc had exchanged a daughter for Chiappini's son in order to keep the Penthièvre inheritance in his own house. The son whose parentage was thus contested was Louis Philippe, then duc d'Orléans and later king of the French. The ecclesiastical court of Faenza in 1824 accepted Chiappini's story but rejected the identification of the nobleman with the duc de Chartres.

Maria Stella's apologia, *Maria Stella ou un échange d'une demoiselle du plus haut rang contre un garçon de plus vile condition*, first appeared in 1830, coinciding with Louis Philippe's accession to the French throne. Its publication may have been arranged by partisans of the duchesse de Berry as a counterblast to pamphlets (supposedly of Orleanist inspiration) casting doubt on the legitimacy of her son, the duc de Bordeaux. The book was reprinted in 1839 and in 1849. Maria Stella died in poverty in Paris on Dec. 28, 1843.

See R. P. Gallwey, *The Mystery of Maria Stella, Lady Newborough* (1907); M. Vitrac, *Philippe Égalité et Chiappini* (1907).

MARIA THERESA (1717–1780), consort of the Holy Roman emperor Francis I, in her own right archduchess of Austria and queen from 1740 of Hungary and Bohemia, was born in Vienna on May 13, 1717, the eldest daughter of the emperor Charles VI and Elizabeth of Brunswick-Wolfenbüttel. Her father's only son having died in earliest infancy, she was the presumptive heiress to the Habsburg succession, but nothing was done to prepare her personally for the tasks before her. On Feb. 12, 1736, she was married to Francis Stephen of Lorraine, who the next year became grand duke of Tuscany in compensation for renouncing his duchy of Lorraine. Charles VI, meanwhile, had hoped to secure her peaceful accession to the entire Habsburg inheritance by inducing the great powers and the German princes to recognize the pragmatic sanction (see AUSTRIA, EMPIRE OF; HABSBURG); but after his death on Oct. 20, 1740, the War of the Austrian Succession (*q.v.*) broke out. Frederick II of Prussia, the elector Charles Albert of Bavaria and, after several months of hesitation, the French all attacked the Habsburg territories.

The young queen found very little support either in her husband or among the majority of her principal counselors; she needed "the heart of a king" not to lose courage. Charles Albert entered Prague and had himself elected king of Bohemia in Dec. 1741; and at Frankfurt in Feb. 1742 he was crowned Holy Roman emperor as Charles VII. His fortunes soon fell when Bavaria was overrun by the Austrians; he died in Jan. 1745; and finally Francis Stephen was elected emperor instead, as Francis I (Sept. 1745). Still, Maria Theresa had to cede Silesia to Frederick at the treaty of Dresden (Dec. 1745) in return for his recognition of Francis. This cession, which was confirmed in the general peace of Aix-la-Chapelle at the end of the war (1748), impaired Austria's position

vis-à-vis the other German states and reduced the Germans in the lands of the Bohemian crown to a minority as against the Slavs.

Naturally Maria Theresa resented the loss of Silesia and hoped to regain that rich province in a new war. To prepare for this, she had to mobilize the potentialities of the ancient Habsburg realms and to transform that mass of territories into a compact state. This implied reducing the power of the estates of the various countries, which were hotbeds of particularist feeling. With the help of Friedrich Wilhelm, Graf von Haugwitz (1700-65), she succeeded, by radical administrative reforms, in reshaping the constitutions of the individual lands. The administrative functions of the estates were largely superseded by centrally appointed bodies; and by overriding the juridical distinction between the lands of the Bohemian crown and the Austrian territories the nucleus of a consolidated Austrian monarchy was brought into being. Moreover, the estates were forced to grant higher taxes. Even so, this great administrative reform was limited to the countries west of the Leitha river, as Maria Theresa was too circumspect to touch the Hungarian constitution so fiercely defended by the Magyar nobility. Her diplomatic ability, however, succeeded in drawing Hungary nearer to the unified monarchy.

It was not enough merely to reorganize the monarchy if Silesia was to be reconquered. A change in Austria's external policy was also necessary, and for this task Maria Theresa found a guide of the highest diplomatic skill in Wenzel Anton von Kaunitz. Kaunitz convinced the empress that she would never defeat Prussia if she relied only on the allies that she had had in the war of the Austrian Succession, namely Great Britain and the United Provinces of the Netherlands; instead he wanted to break the Franco-Prussian alliance and to win the French alliance for Austria. This "diplomatic revolution," at first considered almost impossible, was actually achieved; an Austro-French defensive alliance was concluded on May 1, 1756. This was changed into an offensive alliance a year later, when the Seven Years' War (*q.v.*) had already begun. When the Russian empress Elizabeth joined the anti-Prussian front, Frederick's fate seemed sealed. The Austrian diplomats, however, had overestimated France's power and willingness to wage war, had not taken into account the hesitations of the Russian leadership and could not match Frederick's military genius—though L. J. von Daun and E. G. von Laudon were outstanding generals. The peace of Hubertusburg (Feb. 1763) left Silesia with Prussia.

The emperor Francis I died in 1765; Maria Theresa never ceased to mourn him. Her son Joseph II then succeeded Francis as emperor and became co-ruler with her over the Austrian dominions. Joseph and Kaunitz tried to compensate for the loss of Silesia by acquiring Bavarian territory, but this policy, which they pursued against the wishes of Maria Theresa, was frustrated by the Prussian king. The War of the Bavarian Succession (*q.v.*) brought no glory to either contestant; though the peace of Teschen (May 1779) gave the Innviertel to Austria, the real victor was Frederick of Prussia. On the other hand Joseph and Kaunitz were luckier with their eastern policy, which brought eastern Galicia and Lodomeria to Austria at the first partition of Poland (1772). Maria Theresa, however, agreed only after a hard fight to participate in this piece of banditry, for she held firmly that the concepts of private law and ethics ought also to govern the dealings of states with one another, whereas Joseph and Kaunitz followed the utilitarian conceptions of enlightened despotism.

Maria Theresa's last years were rendered happy by the reforms that she inaugurated after the Seven Years' War. While she and Joseph did not always see eye to eye, both strove to promote the welfare of their people. In fact, the monarchy became notably more prosperous from 1763 onward. Mercantilist ideas, now fully applied, stimulated economic life and created new wealth; and Maria Theresa's social policy improved the lot of the serfs, whose services and labour were appreciably lightened. Especially close to Maria Theresa's heart was the reform of education; some primary schooling was made compulsory, higher education was modernized, and universities were plentifully endowed and brought up-to-date. The empress, who gave protection, help and opportunities to those who had to work for their living, deserved indeed

to be called "the universal and first mother" of her peoples. She died at Schönbrunn on Nov. 29, 1780.

MARI AUTONOMOUS SOVIET SOCIALIST REPUBLIC of the Russian Soviet Federated Socialist Republic in the U.S.S.R., lies in the basin of the middle Volga, covering an area of 8,958 sq.mi. Almost all the republic lies on the northern, left bank of the Volga and is drained by its tributaries, the Vetluga, Bolshaya (Greater) and Malaya (Lesser) Kokshaga, and Ilet. Only in the west does a small area extend on to the right bank, where the northern end of the Volga upland comes up to the high bank of the river. The surface of the main left bank area consists of a level, often swampy, plain of boulder clay, derived from glacial ground moraine and sands of fluvioglacial origin. Toward the east this plain rises gently to the low hills of the Vyatka upland (Vyatski Uval), which reach a maximum height of 902 ft. The climate is markedly continental. Winters are lengthy and cold, with January average temperatures of -13° C. (9° F.). During the not infrequent invasions of cold arctic air masses, temperatures may fall as low as -42° C. (-43° F.). Summers are warm, with July averages about 20° C. (68° F.) and maxima in the thirties (C.) or nineties (F.). Precipitation is about 18 in. a year, with a summer maximum, but there is possibility of wide variation. Annual totals as low as 8 in. and as high as 29 in. have been recorded. The republic lies at the southern limit of the taiga zone, with dense coniferous forest. Spruce and birch are ubiquitous, while sandy areas are usually in pine. Toward the northeast, fir is common. In the extreme south and the Volga right bank area the mixed forest zone begins and some oak is found. Originally forests covered almost all the republic, but much has been cleared in the course of centuries and they now cover just over half the surface. Clearing has been particularly extensive on the Vyatka upland and the right bank area, where conditions are drier. Flood plain meadows line the Volga and other rivers usually subject to annual flooding in spring. There is a great deal of surface water; the republic has 476 rivers although 426 of these are less than 15 mi long. There are also many areas of peat bog, reed and grass marsh and swampy forest, scattered over the boulder clay plain. Apart from the swamp and river meadow areas, soils nearly everywhere are podzols.

The population of the Mari republic numbered 647,680 by the 1959 census. Of these the bulk were rural dwellers (72%, or 465,214). This is well above the U.S.S.R. figure of 52%. The remaining urban inhabitants live in three towns, Yoshkar-Ola (*q.v.*), the capital, with 88,744 people, and Volzhsk and Kosmodemyansk, both on the Volga. There are nine urban districts ("settlements of town type"). The rural population, and especially the Mari, live for the most part in small villages, with less than 250 inhabitants. The Mari or Cheremis (*q.v.*) are a Finno-Ugrian people, related to the Udmurts and Mordvinians. In 1959 they numbered 504,205 in the Soviet Union as a whole and 498,066 in the R.S.F.S.R. In Yoshkar-Ola there is an institute for the study of the Mari language, literature and culture, as well as a Mari theatre. The rest of the population are mostly Russians, but there are also some Turkic peoples, Tatars and Chuvash. In general the Russian population is concentrated in and round the towns and in the main cleared areas. The Mari are found chiefly in the forested areas. Russian colonization dates from the 16th century when, after the fall of Kazan to Ivan IV, the Terrible, the land along the middle Volga passed to Russia. The territory was constituted an autonomous region in 1920 and was raised to an autonomous republic in 1936.

The leading role in the economy is taken by exploitation of the forest wealth. Timber cutting is widespread, the logs being

floated down to the Volga, where they are made up into rafts and sent downstream to Kazan, Kuibyshev, Volgograd and the Donets basin (Donbass). Much of the timber cut is used for pit props and railway sleepers. Since the Revolution, timber processing industries have been established in the Mari republic. Sawmilling is chiefly concentrated along the Volga and the railway running through Yoshkar-Ola. Most other timber working is to be found along the railway, the making of prefabricated houses at Krasnogorski and Suslenger, furniture at Yoshkar-Ola and paper and pulp at Volzhsk. Wooden barges are built on the Volga at Pokrovskoye, while there are ship repair yards at Zvenigovo. The wood-chemical industry, producing turpentine and alcohol, is important. An old established industry is glass making, for which the main centre is Krasny Steklovar. Brick making is carried on at several places, but other industry, chiefly food processing, is concentrated at Yoshkar-Ola. A handicap to more rapid industrial development is the deficiency of all-weather communications. Apart from the Volga along the south of the republic, the only important line of communication is the branch railway from Zelenodolsk in the Tatar Autonomous Soviet Socialist Republic to Yoshkar-Ola and on to its terminus at Golovinski in the north. Good roads are almost non-existent.

Despite the predominance of rural population, agriculture is not well developed. Only 28% of the area is arable and this is found mainly along the Volga and in the northeast on the Vyatka upland. Grains occupy almost 70% of the cropped area, largely rye and oats, with some spring wheat and buckwheat. Flax, potatoes and other vegetables and maize (corn) for silage are also grown. Numbers of livestock are not great. By the early 1960s the number of cows had scarcely attained the pre-Revolutionary level of about 90,000. Pig-keeping has developed steadily and there are more than 250,000 head of sheep and goats. (R. A. F.)

MARIAZELL, a town in Styria, Aus., lies in the valley of the Salza surrounded by the north Styrian Alps. Pop. (1961) 2,191. By road it is 140 km. (87 mi.) S.W. of Vienna, with which it is connected by rail. It is the most famous place of pilgrimage in Austria and is also a summer resort and a winter-sports centre. On the main square is the Gnadenkirche (founded 1157, rebuilt 1644–83), in which is enshrined a 12th-century limewood statue of the Virgin Mary (2 ft. high). The church is visited annually by about 150,000 pilgrims, some of whom attribute favours to the Virgin through the instrumentality of the statue.

MA'RIB, a town and a district of eastern Yemen in the *liwa'* (province) of San'a', 55 mi. N.N.E. of San'a' city, famous in history for its dam. The small modern town stands among the extensive ruins of the old Sabaeen capital and is the headquarters of the *'amil* of the district. The fort contains many antiquities found in the ruins. There is a Shafi'i majority in the district, which includes numerous *sharifs* formerly powerful, under their amir of the al-Qeisi family. Rock salt is mined in the district, which is now desert, but good horses are bred. See also ARABIA: *Archaeology*; SABAEANS. (W. H. Is.)

MARIBO, an amt (county) of Denmark, centred on the small town of Maribo in Lolland and embracing that island, Falster and several islets. Area 694 sq.mi. Pop. (1960) 131,699. It forms the southernmost part of the Danish archipelago, being separated from Germany by Fehmarn Belt. Its gently undulating morainic surface with fertile clay loams forms an important mixed farming district. The principal town and port of Falster is Nykøbing (pop. [1960] 17,850); that of Lolland is Nakskov (16,639). (HA. T.)

MARIBOR (Ger. MARBURG), a town of the Maribor *srez* (district), Socialist Republic of Slovenia, Yugos., is a popular summer resort and tourist centre, picturesquely situated on the Drava river near the Austrian frontier, 105 km. (65 mi.) N.E. of Ljubljana. Pop. (1961) 82,387. The principal buildings are the cathedral of St. John the Baptist, dating from the 12th century, but with many later additions, among them a 17th-century tower 136 ft. high; the 15th-century castle famous for its sculptures; and the Madeleine church built in 1288, destroyed and rebuilt in 1788. There was a settlement at Maribor in Roman times but the present town grew up in the 10th century. In 1282 it was a Habs-

burg trade centre, controlling a vast district. After the Turkish invasions and during the anti-Reformation struggles, the importance of the city declined. Mercantilism at the end of the 18th century and the building of the Vienna-Trieste railway brought new life to the town, which is situated in the midst of a fertile fruit- and wine-growing district. Maribor is one of the largest industrial cities in Yugoslavia, with iron and tinware, automobile and railway car works. A system of hydroelectric power stations is built on the Drava river nearby. More than 14,000 people are employed in industry.

During World War II Maribor was occupied by German troops who tried ruthlessly to germanize the Slovene population of the town and district. Thousands of intellectuals were forcibly deported from Slovenia. In 1945 Maribor was liberated by the Yugoslav partisans. (V. DE.)

MARICOPA, a Yuman-speaking Indian tribe originally driven from the lower Colorado river area by intertribal warfare, like the Halchidhoma and Kohuana whom they absorbed between 1825 and 1838. The date of the Maricopa removal is not known. In 1775 they numbered 1,500–2,000. In the 1960s the Maricopa shared reservation lands with the Pima (*q.v.*) tribe on the Salt and Gila rivers. Their combined population was about 7,700, including less than 200 Maricopa.

Their mode of life was like that of the lower Colorado tribes (see COCOPA; MOHAVE). Houses were flattish hemispheres of timber and earth. Dress was scanty: willow-bark breechcloths for men and short, thick skirts for women. Manufactures included considerable pottery, both for cooking and general containers, but little basketry; cotton blankets and bands were woven by men. Subsistence depended largely on gathering wild mesquite beans and hunting small game, augmented by two minor crops of corn each year. Corresponding to this, a calendar of six lunar months was repeated in a year.

Maricopa political organization was loose in spite of strong tribal unity; chiefs were primarily advisors. Deliberation in the meetinghouses was in a formal, oratorical style when annals were recounted. Threading through the society were male-linked lineages thought to be mystically associated with food plants and with animals. Women alone were called by the lineage name or given personal names referring to the lineage totem.

Wars were frequent, especially with the lower Colorado tribes; club wielders and bowmen formed separate military companies. Pitched battles involving large numbers of warriors were arranged, when champions met in combat and massed fighters stood clubbing away until the losing side was nearly annihilated.

All success among the Maricopa was held to depend on dream contact with spirit birds and animals. The dream narrative, which paralleled Maricopa myths, revealed songs that were believed to give power. Ceremonial consisted in long cycles of songs (essentially myth narratives), each appropriate to a life crisis. The dead were cremated; of the four souls held to belong to each person, the principal soul was said to be reborn four times in the land of the dead. See also YUMAN.

MARIE (MARIE DE MÉDICIS; Italian MARIA DE' MEDICI) (1573–1642), queen consort and, from 1610 to 1614, regent of France, was born in Florence on April 26, 1573, the daughter of Francesco de' Medici, grand duke of Tuscany, and Joan of Austria. Henry IV of France, having had his childless marriage to Margaret of France annulled, chose Marie as his next consort because a Medici dowry would serve to restore the French finances. The marriage was celebrated at Florence, with Henry's proxy, on Oct. 5, 1600. Between 1601 and 1609 Marie bore the king six children (see BOURBON: Table II: *The Bourbon Kings of France*); but Henry's infidelities and Marie's devotion to her Florentine favourite Concini and his wife Leonora Galigaï (see ANCRE, CONCINO CONCINI, MARQUIS D') brought perpetual turmoil into their relationship. Marie, however, secured her own coronation as queen on May 13, 1610, the very day before Henry was assassinated.

Consequently she could be named as regent for her young son Louis XIII, even though members of her entourage were suspected of complicity in the assassination.

As regent, the queen mother reversed Henry IV's policy for France: whereas Henry had resisted Spain, she admitted the Spanish ambassador to her council; and she squandered the revenue and made humiliating terms with rebel princes (*see* FRANCE: *History*). Though Louis XIII came of age in Sept. 1614, Marie continued to govern for him, capitulating again to the princes (1616), until, on the eve of a third rebellion, Louis had the marshal d'Ancre assassinated on April 24, 1617. Marie was then exiled to Blois; but in Feb. 1619 she escaped from there and began a revolt. Her principal adviser, the future cardinal de Richelieu (*q.v.*), then bishop of Luçon, negotiated the peace of Angoulême with the royal government for her, after which she was allowed to set up her court at Angers; and he won good terms for her again after the defeat of a further rebellion (Aug. 1620). Readmitted to the king's council in 1622, Marie obtained the cardinal's hat for Richelieu (Sept. 1622) and finally appointment as the king's premier minister (Aug. 1624). She also began the building of the Luxembourg palace in Paris, with decorations by Rubens.

By 1628 the queen mother was Richelieu's worst enemy: his services to Louis XIII appeared to her as an ungrateful betrayal of her past causes; and she stood with the *parti dévot*, which wanted a French understanding with Spain and Austria for Catholic solidarity against the Protestants. In the crisis known as the Day of Dupes (Nov. 10–12, 1630) she and her friends thought that they had persuaded Louis to dismiss Richelieu, but their attempt turned to Richelieu's advantage. Banished to Compiègne, Marie fled to Brussels in the Spanish Netherlands in July 1631, never to return to France. She died destitute at Cologne on July 3, 1642.

See L. Batiffol, *La Vie intime d'une reine de France au XVII^e siècle: Marie de Médicis* (1906; Eng. trans. 1908); P. Erlanger, *Louis XIII* (1946), *L'Étrange mort de Henri IV* (1957). (P. Er.)

MARIE (MARIA LESZCZYŃSKA) (1703–1768), queen consort of Louis XV of France, was born at Breslau (Wrocław) in Silesia on June 23, 1703, the daughter of Stanisław Leszczyński, who was elected king of Poland in 1704 as Stanisław I. After her father's withdrawal from Poland, Marie was brought up by him in straitened circumstances until the proposal that she should marry the king of France came as a great stroke of good fortune.

The marriage was arranged by Louis XV's premier minister, Louis Henri, duc de Bourbon, who after the rupture of the project for marrying the king to a Spanish infanta, was looking for a suitable Catholic princess. The duc's mistress, the marquise de Prie (Agnès de Pléneuf), encouraged him to choose someone unlikely to be a formidable rival at court; Marie was chosen and the marriage took place at Fontainebleau on Sept. 5, 1725.

Louis quickly lost interest in his queen, who angered him by her objection to the dismissal of the duc de Bourbon in 1726; and his long series of mistresses caused her great unhappiness. However, she bore the king nine children between 1727 and 1737. The marriage contributed to France's involvement in the War of the Polish Succession and to the French acquisition of Lorraine. Marie died at Versailles on June 24, 1768.

See P. de Nolhac, *La Reine Marie Lezinska* (1900); A. Leroy, *Marie Lezinska* (1940).

MARIE (1875–1938), queen consort of Rumania from 1914 to 1927, was born in England at Eastwell Park, Kent, on Oct. 29, 1875, the eldest daughter of Queen Victoria's son Alfred, duke of Edinburgh, and Maria, daughter of the Russian emperor Alexander II. On Jan. 10, 1893, she married Prince Ferdinand of Hohenzollern-Sigmaringen, nephew and heir of King Carol I of Rumania. Her early years in Bucharest as crown princess were acutely unhappy. Accustomed to English life, she was constrained by the strict formal discipline imposed by King Carol and felt the atmosphere of Rumania to be alien. Yet she grew to love the country and its people and became greatly beloved for her beauty and warmth of heart. For her six children *see* HOHENZOLLERN: Table V: *The Swabian Line*.

On Carol I's death in Oct. 1914, Ferdinand became king of

Rumania. Keenly loyal to Great Britain, the young queen played an important part behind the scenes in stiffening the pro-Allied faction in Rumania during World War I, and she rejoiced when the country joined the Allied cause in 1916. She was then active as a Red Cross nurse and also in maintaining morale at Iași, where the government set itself up after the German occupation of Bucharest. Her popularity with the troops was high. When a greater Rumania had been established after the war, the long-delayed coronation of the king and queen took place at Alba Iulia on Oct. 15, 1922. Queen Marie visited the United States in 1926.

On King Ferdinand's death on July 20, 1927, Queen Marie, already alienated from her eldest son Carol (who had just renounced his rights of succession), was disappointed at not being made a member of the regency for her grandson Michael. Accordingly she withdrew from active participation in Rumanian political life and devoted her time to writing and to the creation of a beautiful house and garden at Balcic on the Black sea (Balcik in the Bulgarian Dobruja after 1940). She died at Sinaia on July 18, 1938, and was buried at the church of Curtea de Argeș, her heart being interred at Balcic. Queen Marie's published works include *The Country That I Love* (1925); *Crowned Queens: a Tale From Out of the Past* (1929); *Masks*, a novel (1935); and *The Story of My Life*, three volumes (1934–35). (B. Br.)

MARIE, PIERRE (1853–1940), French neurologist who was the first to describe several neural and endocrine diseases, was born Sept. 9, 1853, in Paris. There he became a pupil of C. J. Bouchard and J. M. Charcot (*q.v.*), received his M.D. degree in 1883 and two years later became director of neurological service at the Bicêtre and Salpêtrière hospitals. His clinical lectures on diseases of the nervous system made him internationally known. In 1886 he published the first description of acromegaly (enlargement of the nose, chin, hands and feet); this paper and a second one (1889) on the same subject, which together form the origins of modern endocrinology, describe in detail the causes of the disease; i.e., a tumour and functional disturbances of the pituitary gland. In 1893 Marie published a paper on a hereditary disease of the cerebellum that leads to serious disturbances of the equilibrium (hereditary cerebellar ataxia: Marie's ataxia). A certain type of progressive muscular atrophy is named jointly for Marie and his teacher (Charcot-Marie type). Marie's revolutionary papers on aphasia were opposed to the localization of symptoms at a specific area of the brain (as had been suggested by Paul Broca) and paved the way for the modern concept of aphasia. He died in Paris on April 13, 1940.

MARIE AMÉLIE DE BOURBON-SICILES (1782–1866), queen of Louis Philippe, king of the French, was born at the palace of Caserta, near Naples, on April 26, 1782, the daughter of King Ferdinand IV of Naples (afterward Ferdinand I of the Two Sicilies) and of his consort the archduchess Maria Carolina. She was piously educated, mainly at Palermo in Sicily, where the Neapolitan royal family took refuge (1798–99, 1806–14) during the French occupation of the mainland. Her marriage (Nov. 25, 1809) with the exiled Louis Philippe (*q.v.*), then duc d'Orléans, helped him to improve his relations with the senior branch of the French royal family. With him she went to France during the Hundred Days (1815). After the second Restoration she lived at the Palais Royal in Paris or at Vernon, Neuilly-sur-Seine or Eu. absorbed in bringing up her children (*see* BOURBON: Table IV: *The House of Orléans from 1830*). When Louis Philippe was king (1830–48), she took no part in political affairs, being always afraid of a new revolution. At the revolution of Feb. 1848 she accompanied Louis Philippe to England, where they settled at Claremont, Esher, Surrey. Widowed in 1850, Marie Amélie died at Claremont on March 24, 1866. Her *Journal* was edited by Henriette of Belgium, duchesse de Vendôme, in two volumes (1938–43).

See A. Trognon, *Vie de Marie Amélie, reine des Français* (1872); the duchesse de Vendôme, *La Jeunesse de Marie Amélie, reine des Français* (1935). (J. V.)

MARIE ANTOINETTE (1755–1793), the Austrian queen consort of Louis XVI of France, was born in Vienna on Nov. 2,

1755, the 11th daughter of the Holy Roman emperor Francis I and Maria Theresa. Her name is associated with the decline in the moral authority of the French monarchy in the closing years of the *ancien régime*; with the courtly extravagance that was erroneously held to be the cause of the financial disorders of the French state at the same period; and also, more correctly, with the policy of court resistance to the progress of the French Revolution, which finally led to the overthrow of the monarchy.

In more senses than one, however, Marie Antoinette was the victim of circumstance. In her youth she was a pawn on the diplomatic chessboard in that her marriage to the French dauphin on May 16, 1770, was intended to strengthen the Austrian alliance with France. The stigma of being the representative of Austria when the connection with Vienna was unpopular in France remained with her throughout her life. She was unfortunate also in her husband, since his frigid behaviour and initial inability to produce an heir drove her to seek companionship and distraction among favourites and discreditable companions whom she might have avoided if her family life had been more satisfactory. It was her husband's personal weakness and political nullity that forced her to play such a prominent political role during the Revolution.

The influence that Marie Antoinette exerted on French internal and foreign policy between the accession of Louis XVI in May 1774 and the outbreak of the Revolution in 1789 has probably been much exaggerated. Her efforts, for example, to secure the return to power of the duc de Choiseul in 1774 were unsuccessful; and the fall of Turgot in 1776 must be attributed to the hostility of Maurepas and to the differences that arose between Turgot and Vergennes over French participation in the American Revolution rather than to the direct intervention of the queen. Marie Antoinette was not, at that time, interested in politics except as a way of securing favours for her friends, and her political influence never exceeded that formerly wielded by the royal mistresses of Louis XV. In foreign policy she encountered the opposition of both Louis XVI and Vergennes in her efforts to advance Austrian interests, and it is certain that her brother, the emperor Joseph II, was gravely disappointed at her lack of success. Even her deference to the persistent requests of her favourites, such as the comtesse de Polignac (Yolande de Polastron), did not entail a great drain on the treasury. More serious was the frivolity of her own behaviour, her close association with the more dissipated sections of the French court and, above all, the suspicion of immorality and corruption she incurred as a result of the "Affair of the diamond necklace" (see DIAMOND NECKLACE, AFFAIR OF THE) in 1785-86. This incident was all the more unfortunate for the queen's reputation because, since the birth of her daughter Marie Thérèse Charlotte in Dec. 1778 and of the dauphin Louis in Oct. 1781, she had led a quieter and more conventional life. Her second son, the future Louis XVII, was born in March 1785. Her most intimate friend from this time onward was the princesse de Lamballe.

Though the queen had supported Jacques Necker's return to power at the end of Aug. 1788 and had approved of the concession of double representation to the third estate, her unpopularity was at its height when the estates-general met at Versailles in May 1789 (see FRANCE: History; FRENCH REVOLUTION). This was because she was regarded, though without justification, as an associate of the reactionary coterie of the king's brother Charles, comte d'Artois (see CHARLES X, king of France) and because of the aspersions cast on her moral character by the duc d'Orléans (Louis Philippe [1747-93] the future *Égalité*). At the end of May she seemed to have intervened little in politics, as she was distracted by the illness of her elder son, who died early in June. After the fall of the Bastille the queen was deprived of the company of some of her most intimate friends, as they emigrated; but in the October days, when the court was transferred to Paris and she herself was the main target of popular resentment, she displayed high personal courage that sustained the royal family both then and throughout its later disasters.

Because of Louis XVI's irresolution at this period Marie Antoinette was to play an increasingly important part in the secret

intrigues to liberate the royal family from its virtual captivity in Paris. However, the queen's aversion to Mirabeau, who became the paid secret adviser of the court in May 1790, and the king's refusal to contemplate a resort to civil war ensured the rejection of Mirabeau's initial plans for an escape to the interior of France and an appeal for royalist support in the provinces. After Mirabeau's death in April 1791, the queen turned for help chiefly to her friends outside France; and it was with the assistance of the Swedish count Hans Axel Fersen, the baron de Breteuil (L. A. Le Tonnelier) and F. C. A. de Bouillé that the plans were laid for the flight of the royal family to Montmédy, on the eastern frontier.

When the royal family was stopped at Varennes on June 21, 1791, and brought back to Paris, the queen was forced back on further secret intrigues. This time she plotted with the leaders of the constitutional monarchists in the Constituent Assembly, namely Antoine Barnave and Alexandre and Théodore de Lameth, who were anxious to check the progress of republicanism and to bring the Revolution to a close. The basis of their secret understanding with the queen was that, after the constitution had been revised so as to bolster up the executive power of the king, it should be loyally accepted and implemented by Louis XVI. In foreign policy the aim of the constitutionalists was to persuade the *émigrés* to return and to prevent the emperor Leopold II (Marie Antoinette's brother) from being committed to a counter-revolutionary crusade against France. Marie Antoinette, however, distrusted Barnave and his associates, and though she acquiesced in the king's acceptance of the constitution in Sept. 1791, she warned the emperor that she was not in favour either of their domestic or foreign policy. Instead she urged the necessity of an armed congress of the powers to negotiate from strength for the restoration of the royal authority. This duplicity paralysed the pacific policy of Barnave and did not dissuade the *émigrés* from their more aggressive designs for the restoration of the *ancien régime*. After France had declared war on Austria on April 20, 1792, the queen was naturally suspected of being the prime mover of the counterrevolutionary coalition, and popular resentment against her was one of the factors that led to the storming of the Tuileries palace and the overthrow of the monarchy on Aug. 10. For the rest of her life the queen was a prisoner, at first together with the rest of the royal family in the Temple and, after Aug. 1, 1793, in solitary confinement in the Conciergerie. Throughout this period, even after the execution of the king on Jan. 21, 1793, her courage remained unshaken. She herself was placed on trial before the Revolutionary tribunal on Oct. 14, 1793, after several unsuccessful attempts had been made to secure her escape. Sentenced to death, she was guillotined in the Place de la Révolution in Paris on Oct. 16.

MARIE DE FRANCE (fl. late 12th century), the earliest known French woman poet, whose verse narratives and simple handling of Aesopic and other fables are works of considerable charm and talent, and were probably written in England. What little is known about her is taken or inferred from her writings and from a possible allusion or two in contemporary authors. From a line in the epilogue to her fables: "Marie ai nun [= name], si sui de France" Claude Fauchet in his *Recueil de l'origine de la langue et poésie françoise* (1581) drew the name by which she has since been known. The same epilogue tells us that her *Fables* were translated from, or based on, an English source, for a Count William, usually identified as William Longsword, earl of Salisbury (d. 1226), or sometimes as William Marshal, earl of Pembroke (1146-1219). Her *Lais* were dedicated to a "noble" king, presumably Henry II of England (1154-89), though it is sometimes claimed that this was Henry's son, the Young King (d. 1183). Her version of *L'Espurgatoire saint Patriz* was based on the Latin text (c. 1185) of Henry of Saltrey. Every conjecture about her, her identity (was she Marie, the half-sister of Henry II, who became abbess of Shaftesbury?), the chronological order of her works (*Lais* before 1167?, *Fables* about 1180?, *Espur-*

gatoire after 1899?) and the sources of the most attractive of her works, the *Lais*, have been hotly debated. She claims that her 12 narrative *Lais*, in octosyllabic rhymed couplets, varying in length from the 118 lines of *Chevrefoil*, an episode in the Tristan story, to the 1184 lines of *Eliduc*, a story of the devotion of a first wife whose husband brings a second from overseas, were based on Breton lays; but of these nothing is known. Her treatment of them is fascinating; she develops her analyses of love problems with great skill against varying backgrounds of realism and fairy tale. Here, and in some of her fables, she displays a keen interest in contemporary affairs and manners.

MARIE LOUISE (1791–1847), second consort of the French emperor Napoleon I and later duchess of Parma, was born an Austrian archduchess on Dec. 12, 1791, the eldest daughter of the Holy Roman emperor Francis II (later Francis I of Austria) and Maria Theresa of Naples-Sicily. The niece of the unhappy queen of France, Marie Antoinette, she was brought up to detest the French Revolution and its consequences. Her marriage to Napoleon seems to have been suggested by the Austrian statesman Metternich shortly after the Franco-Austrian peace of Oct. 1809, at a moment when Napoleon, having already decided to dissolve his marriage with the childless Joséphine, was tentatively negotiating with the Russian emperor Alexander I for the hand of his daughter Catherine. Joséphine's marriage was annulled by the church on Jan. 12, 1810, and while the Russian negotiations were being prolonged for political reasons Napoleon in February asked for Marie Louise in marriage. She was married to his proxy in Vienna on March 11, 1810, and to him in person in Paris on April 1–2. Delighted at this alliance with the Habsburg dynasty, which linked his empire, born of the Revolution, with the "legitimate" sovereigns of the old Europe, Napoleon showed extreme affection for Marie Louise during their honeymoon at Compiègne; and on March 20, 1811, she bore him the long-desired heir, the king of Rome and future Napoleon II (see REICHSTADT, NAPOLEON FRANÇOIS JOSEPH CHARLES, Duke of).

Marie Louise accompanied Napoleon to Dresden in May 1812, where he conferred with Francis of Austria and Frederick William III of Prussia before launching his disastrous attack on Russia. Subsequently she was regent for him in Paris (with his brother Joseph Bonaparte as lieutenant general) during his absences. After his first abdication (April 6, 1814), however, she made her way back to Austria with her son, escorted by Adam Albert, Graf von Neipperg (1775–1829). The treaty of Fontainebleau (April 11, 1814) awarded to her the formerly Bourbon duchies of Parma, Piacenza and Guastalla in full sovereignty, with the succession to them for her son. She ignored Napoleon's entreaties to join him in Elba and was completely estranged from him by his threat of forcible abduction. During the Hundred Days (1815) she remained in Austria, showing no desire for the success of Napoleon in France. The congress of Vienna ratified her accession to Parma, Piacenza and Guastalla, despite Bourbon opposition; but her son's right of succession was overruled (1817), the duchies being secured to her for her lifetime only. She went to Parma without her son, who was given the title of duke of Reichstadt in 1818.

Marie Louise had a daughter, Albertine (1817–67), by Neipperg before Napoleon's death, but Napoleon in exile on St. Helena excused her infidelity and mentioned her with tenderness in his will. In Aug. 1821, after Napoleon's death (May), she bore Neipperg a son, Wilhelm Albrecht, later prince of Montenuovo (d. 1895); and in Sept. 1821 she married Neippergmorganatically. Together they governed the duchies more liberally than most

other princes of the Restoration in Italy: some Napoleonic institutions were preserved, equal rights for women in inheritance were established (1817), and a civil code was promulgated (Jan. 1820). Josef von Werklein, however, who became secretary of state in Parma after Neipperg's death, pursued a more reactionary policy, and in 1831 a rising in Parma forced the duchess to take refuge with the Austrian garrison in Piacenza. Restored to power by the Austrians, she ruled thenceforward in accordance with their prescriptions.

In 1832 Marie Louise visited the dying duke of Reichstadt in Vienna. In Feb. 1834 she contracted a second morganatic marriage, with Charles René, comte de Bombelles (1784–1856). She died in Parma on Dec. 17, 1847, and was buried in the Capuchin church in Vienna.

Bessard, *La Vie privée de Marie Louise* (1953).

MARIA TERESA DE AUSTRIA (1638–1683), queen consort of Louis XIV of France, was born on Sept. 10, 1638, in the palace of the Escorial, the daughter of Philip IV of Spain and Elizabeth of France. The treaty of the Pyrenees in 1659 stipulated that she should marry the French king, at the same time renouncing any claim to the Spanish succession. She was married in June 1660, in ceremonies at Fuenterrabia and at St. Jean-de-Luz on the Franco-Spanish frontier. Though he made use of her claims to the Burgundian inheritance of the Spanish Habsburgs—as if these were not covered by her renunciation—in order to justify the War of Devolution after Philip IV's death, Louis soon lost interest in his queen, and she was overshadowed by his series of mistresses. The marquise de Maintenon (*q.v.*) finally arranged a reconciliation between her and Louis, but the queen died on July 30, 1683, at Versailles. Of her six children only one survived her, the dauphin Louis, who died in 1711.

MARIETTA, a city of Georgia, U.S., the seat of Cobb county, is located 20 mi. N.W. of Atlanta, in the Blue Ridge foothills at an altitude of 1,118 ft. Founded in 1833, when Cobb county was formed from Cherokee land, it was chartered as a city in 1852. The state-owned Western and Atlantic railroad, completed from Atlanta to Marietta in 1845, and subsequent railroad connections stimulated the town's growth.

In 1942 an aircraft-manufacturing plant was located 3 mi. S., where B-29s (the Superfortresses of World War II) were fabricated; the plant was reopened in 1951. As many as 15,000 workers have been employed there in the manufacture of jet aircraft.

Adjacent are the Atlanta naval air station and Dobbins air force base, centre for U.S. southeastern air defenses. A variety of small industries including furniture, textiles and stone antedated aircraft.

The Kennesaw Mountain National Battlefield park, 2½ mi. N.W., which marks the site of an important American Civil War battle, is situated at Kennesaw mountain (1,808 ft.). On June 27, 1864, entrenched Confederate forces under Gen. Joseph Eggleston Johnston repulsed a frontal assault by invading Federal troops under Gen. William Tecumseh Sherman. Federal losses exceeded 2,500. A flanking movement finally forced a Confederate retreat across the Chattahoochee river into the environs of Atlanta. More than 10,000 Federal soldiers are buried in the Marietta National cemetery.

For comparative population figures see table in GEORGIA: Population. (J. C. W.)

MARIETTA, a city of southeastern Ohio, U.S., the seat of Washington county, is located on the Ohio river, at the mouth of the Muskingum, 45 mi. S.E. of Zanesville. Its history dates from 1785, when Ft. Harmar was constructed there. Permanent settlement, the first in Ohio, began April 7, 1788, with the arrival of Gen. Rufus Putnam (*q.v.*) and his pioneer group, the Ohio Company of Associates, and it was named in honour of Queen Marie Antoinette of France. On July 15, 1788, Arthur St. Clair was installed there as first governor of the Northwest territory. The first years were difficult, because of the Indian War of 1791–

95. For many years thereafter Marietta was noteworthy in the flatboat trade in agricultural produce down river to New Orleans. During the steamboat era it was a typical river town. For a generation after the American Civil War it was the centre of an important oil and gas area.

There was still a considerable production in the 1960s, mostly on a secondary-recovery basis. Certain favourable peculiarities of soil and climate contributed to the growth of truck farming in the surrounding countryside, but much of the best land has been taken over for industry or housing. The chief products of the local and nearby factories are chemicals (especially plastics), metal alloys and office equipment.

Marietta is the seat of Marietta college (related to the Congregational Christian Church and chartered in 1835), the library of which has the original records of the Ohio company and the 20,000-volume Rodney M. Stimson collection relating chiefly to the Ohio and Mississippi valleys. Worthy of note are Conus, a large and perfect Indian mound in the Mound cemetery; "The Start Westward of the United States," a memorial in Muskingum park, dedicated by Pres. Franklin D. Roosevelt in 1938; and the Campus Martius museum, operated by the Ohio Historical society. The museum houses the land office of the Ohio company, the home of Rufus Putnam, a "river museum," and the Charles Goddard Slack collection of prints and autographs. A great tourist attraction, the "W. P. Snyder, Jr.," a river towboat of a type long obsolete, which is moored in the Muskingum river, also belongs to the museum.

For comparative population figures see table in OHIO: Population.

(R. L. J.)

MARIETTE, AUGUSTE (1821–1881), French Egyptologist and a pioneer of excavation in Egypt, was born on Feb. 11, 1821, at Boulogne. He was educated at the Collège de Boulogne and became professor there in 1841. In 1849 he joined the Egyptian department of the Louvre and the following year was sent to Egypt on a government mission to find and purchase Coptic, Syriac, Arabic and Ethiopic manuscripts. Soon after his arrival, however, Mariette discovered the ruins of the Serapeum at Memphis and he remained in Egypt for four years to continue his excavations. He dispatched most of the archaeological treasures to the Louvre and on his return he was appointed assistant curator.

In 1858 Mariette accepted the position of conservator of Egyptian monuments to the former khedive Ismail Pasha, and moved with his family to Cairo. He studied the pyramid fields of Memphis and Saqqarah, the necropolis of Meydum and those of Abydos and Thebes, and disinterred the great temples of Dendarah and Edfu. Important excavations were carried out at Karnak, Medinet-Habu and Deir al Bahri; Tanis (the Zoan of the Bible) was partially explored in the Delta; and even Gebel Barkal in the Sudan. The museum at Bulaq, Cairo, was founded to house his discoveries. The Sphinx was bared to the rock level, and the famous granite and alabaster monument miscalled the "Temple of the Sphinx" was discovered. Mariette was raised successively to the rank of bey and pasha. He died at Cairo on Jan. 19, 1881. (See also EGYPT: Archaeology.)

His chief published works are: *Le Sérapéum de Memphis* (1857–64); *Dendérah* (1873–75); *Abydos* (1869); *Karnak* (1875); *Deir-el-Bahari* (1877); *Listes géographiques des pylônes de Karnak* (1875); *Catalogue du Musée de Boulaq*, 6th ed. (1864–66); *Aperçu de l'histoire d'Égypte* (1874); *Les Mastabas de l'ancien empire* (ed. by G. Maspéro) (1889).

See G. C. C. Maspéro, *Notice biographique sur Auguste Mariette* (1905).

(W. R. D.)

MARIGNANO, BATTLE OF (Sept. 13–14, 1515), the Franco-Venetian victory over Swiss mercenaries in the first Italian campaign of Francis I of France, won near the village of Marignano (the modern Melegnano, on the Lambro river, 10 mi. S.E. of Milan).

Francis I was determined to conquer the duchy of Milan, his predecessor Louis XII having been unable to make good the French claim to it. He had the alliance of Venice and could expect some Genoese help; but Massimiliano Sforza, the duke in possession, not only had the support of the Holy Roman emperor Maximilian

I, Pope Leo X and Ferdinand II of Aragon but also was the protégé of the Swiss confederacy. The Swiss, whose mercenary soldiers were reputedly the best in Europe, were being encouraged to take an actively anti-French policy in Italy by the bishop of Sion, Matthäus Cardinal Schiner.

The Swiss controlled the more practicable passes over the Alps; but in Aug. 1515 the main French army crossed the Col de l'Argentièr (Col de Larche or Maddalena) by a route hitherto unexploited. Having taken Novara, it then turned southeastward to establish communication with the Venetians under Bartolomeo d'Alviano. The papal and Spanish forces lay farther to the south, and the French could now easily have taken Milan if the Swiss had agreed to be bought off. The Swiss, however, though they had not received their subsidies, were reinforced from Switzerland and were finally persuaded by Schiner to reject France's overtures and to move southward to the defense of Milan.

In the afternoon of Sept. 13 the Swiss (between 25,000 and 30,000 strong, with 10 guns) advanced against the position that the French (about 40,000, with 72 guns) had taken up near Marignano. A stream, with channels, ran through marshy ground between the opposing armies; and despite heavy losses under artillery fire the Swiss moved across this ground—over which the French heavy cavalry could not operate—to fall upon Francis I's *lansquenets* (*Landsknechte* or mercenary light infantry from Germany). By midnight, however, when fighting was suspended, the Swiss had had to withdraw somewhat. Next morning they sent their right and left against the French flanks, and the issue was uncertain for eight hours until Alviano and the Venetian cavalry arrived from Lodi. A final drive by Francis made the Swiss give way; but the French, who had lost about 8,000 men, did little to harass the orderly Swiss retreat. The battle put an end to Schiner's policy and won Milan for the French king.

MARIGNOLLI, GIOVANNI DE' (fl. 1338–1357), a Franciscan, one of four ecclesiastics appointed by Pope Benedict XII as his legates to the court of the great Khan, was born, probably before 1290, in Florence. His family is long extinct, but a street near the cathedral (Via de' Cerretani) formerly bore the family name.

The Catholic mission left Avignon in Dec. 1338 and joined the Tatar envoys at Naples. The combined embassies traveled via Constantinople and the Black sea to the court of Mohammed Uzbek, khan of the Golden Horde, at Sarai on the Volga. He entertained them during the winter of 1339–40 and sent them across the steppes to Armalec, Almalig or Almaligh (i.e., Kuldja, 44° 00' N., 81° 00' E.), the northern seat of the house of Chaghatai. There the legates built a church and baptized several persons. Leaving Armalec in 1341 they reached Peking in May or June 1342. They were well received by the reigning khan, the last of the Mongol dynasty in China. There Marignolli stayed for three or four years, leaving via Zayton or Amoy in Dec. 1347. He reached Columbum (Kollam or Quilon in Malabar) in Easter week, 1348, and found there a Catholic church (probably founded by Jordanus of Severac). He visited the shrine of St. Thomas (near Madras), the kingdom of Saba (which he identified with the Sheba of the Bible, but which seems to have been Java) and Ceylon where he was detained. From Ceylon, his route appears to have been by Ormuz, Baghdad, Mosul, Aleppo, Damascus and Jerusalem. In 1353 he reached Avignon and delivered a letter from the great khan to Pope Innocent VI. In 1354, the emperor Charles IV made Marignolli one of his chaplains. Shortly afterward he became bishop of Bisignano. In 1356 he was an envoy to the pope from Florence, and in 1357 he was at Bologna. The date and place of his death are unknown.

Marignolli inserted notes of his Asian travels in his *Annals of Bohemia*, compiled for Charles IV. These fragments were not noticed until they were included by Father G. Drobner in *Monumenta historia Bohemicae nunquam antehac edita* (1768). *Fontes rerum bohemicarum*, ii, 49–604 (1882) contains the best text.

MARIGNY, ENGUERRAND DE (c. 1260–1315), a prominent minister of the French king Philip IV, belonged to the minor nobility and was born at Lyons-la-Forêt in Normandy. Equerry to Hugues de Bouville (Philip IV's chamberlain), he became in 1298 chief bread bearer to the queen, Joan (Jeanne) of Navarre, whose goddaughter, Jeanne de Saint-Martin, he married. After 1302 Marigny's rise was rapid. Knighted and later created comte de Longeville, he became grand chamberlain to the king, was sent to preside over the Norman exchequer in 1306 and subsequently became *surintendant des finances et des bâtiments* and *capitaine* of the Louvre. His power reached its zenith in the years 1313–14 when he was in charge of the royal treasury and of the newer auditing department, the *chambre des comptes*, imposing on them a unified rule. On Aug. 1, 1314, he addressed an assembly at Paris on the financial difficulties arising from Philip's renewal of war with Flanders. Generally unpopular both with the nobility and with the *bourgeoisie* and associated with the policy of heavy taxation and debasement of the coinage, Marigny also incurred the special enmity of the king's brother, Charles of Valois. In the last few months of Philip's reign a commission was nominated to examine Marigny's administration of the finances. After the accession of Philip's son Louis X the membership of the commission was changed to include many of Marigny's enemies, including Charles of Valois. Nevertheless the accounts were found to be in order. Charles of Valois then made further similar charges against Marigny, who was arrested and confined successively in the Louvre, the Temple and the keep of Vincennes. King Louis was inclined merely to banish Marigny, but Charles of Valois then accused the minister of sorcery, and immediate execution was ordered. Marigny was hanged on the public gallows at Montfaucon, just outside the city wall, to the northeast of Paris, on April 11 or 30, 1315. In 1317 his body was taken down and buried in the Chartreux at Paris. The legend that Marigny himself had erected the gallows is untrue.

See P. Clément, *Trois Drames historiques* (1857).

MARIGOLD, a common name given to several plants, of which the following are the best known: *Tagetes erecta*, the African marigold; *T. patula*, the French marigold; *Calendula officinalis*, the pot marigold; and *Chrysanthemum segetum*, the corn marigold. These all belong to the family Compositae, but the marsh marigold (*q.v.*), *Caltha palustris*, belongs to the Ranunculaceae (buttercup family). (See also ICE PLANT for the fig marigold.)

To the gardener the name marigold most commonly indicates species of the genus *Tagetes* and especially the developed varieties of *T. erecta* and *T. patula*. Contrary to the origins indicated by their common names, these are native to America, from Mexico to the Argentine. These hardy annuals, from the tiny (one to one and one-half foot) French types to the giant (three to four feet) Africans, have finely cut strong-scented foliage, except for a few later-developed unscented varieties. Besides the above species, *T. lucida*, sweet-scented marigold, and *T. tenuifolia*, striped marigold, are grown. The flowers of yellow, orange and red to red-brown are popular in the garden in beds, borders and massed groups, and are excellent as cut flowers. Seed sown in the spring in any garden soil—poor to average, wet or dry—in sun or partial shade will give a profusion of blooms from midsummer to frost. The plants require little attention and transplant readily.

The pot marigold (*Calendula officinalis*), a familiar garden plant up to two feet in height, with unscented foliage and orange-coloured blossoms, is probably not known in the wild state. Single and dou-

ble varieties have been in cultivation for at least 300 years; John Gerard in his *Herball* (1597) mentions a proliferous form, the "fruitful marigolde," in which small flower heads proceed from beneath the circumference of the flower. He remarks that it is called *Calendula* "as it is to be seen to flower in the calends [first] of almost everie moneth." *Calendula officinalis* is one of the easiest of annuals to grow; seed sown in spring in any average soil in full or partial sun will produce flourishing plants which bloom from late spring to frost. Smaller plants, cut back in fall and potted, will bear flowers indoors for several weeks.

The Eurasian corn marigold (*Chrysanthemum segetum*) is a weed common in fields in England and throughout the eastern part of North America. The cape marigold (*Dimorphotheca aurantiaca*) is a South African perennial, much cultivated for ornament.

MARIJUANA (MARIHUANA), an intoxicating excitant drug, used illegally in the United States and elsewhere usually in cigarette form, is obtained from the top leaves and flowers of the Indian hemp plant (*Cannabis sativa*), which grows in most parts of the world. Since ancient times people have used its products for stimulation and intoxication, under the names hashish, bhang, ganja, kef, etc. Improper use of marijuana is a serious medical and social problem in various countries. Many emotionally unstable persons known to be associated with major crimes prove to be marijuana users. Marijuana intoxication may be accompanied by such physical and psychic manifestations as thirst, hunger, craving for sweet foods, nausea, dizziness, abdominal pain, drowsiness, irritability, delusions of grandeur or persecution, uncontrollable hilarity, talkativeness, apprehension, mental confusion, prostration, depression, inarticulate speech and delirium. Mental dullness ordinarily increases with continued use of marijuana and psychoses may develop. Some persons have suffered very disagreeable effects a short time after smoking one marijuana cigarette.

Withdrawal of marijuana does not cause the extreme physical discomfort seen in opiate withdrawal. Addiction to heroin or morphine (*qq.v.*) is a common sequel to the use of marijuana, especially among young persons.

Marijuana, formerly used in medicine as an analgesic and sedative, was considered to have so little medical value that it was removed from the United States pharmacopoeia. The federal Marihuana Tax act of 1937 prohibited its use. It was placed under international control because of its increased abuse throughout the world. The World Health organization undertook a project to develop a strain of the hemp plant devoid of intoxicating resins. See DRUG ADDICTION; HASHISH; HEMP.

MARILLAC, SAINT LOUISE DE (1591–1660), co-founder with St. Vincent de Paul (*q.v.*) of the Daughters of Charity, better known as Sisters of Charity of St. Vincent de Paul, was born either in Paris or Ferrières on Aug. 12, 1591, and educated by Dominican nuns at Poissy and in a lay boarding school in Paris. Her delicate health, which proved lifelong, prevented her from joining the strict order of Poor Clares, and in 1613 she married Antoine le Gras, secretary to Queen Marie de Médicis, by whom she had a son before his death in 1625. Vincent de Paul, whom she had chosen as her spiritual guide, moderated her zeal and encouraged her to undertake charitable works. Receiving into her home a few country girls sent by him, she trained them in the spiritual life and taught them to assist the Ladies of Charity in visiting, feeding and nursing sick poor. Their number increased and in 1633 Vincent founded the Daughters of Charity with Louise as their superior. He would not have them called nuns or have them enclosed. He thus pioneered in bringing religious women into the service of God and man outside the cloister. The rest of Louise's life was uneventful. She died in Paris on March 15 1660. She was canonized in 1934, and her feast day is March 15.

MARIMBA, a xylophone with resonators below the keys that originated in Java. It was taken to Africa where it spread across the centre of the continent and was taken thence by the slave trade to Central America. In the U.S. the name has been applied to an orchestral xylophone, with large keys and soft beaters, used mainly for light music. In the Javanese instrument the keys are of bronze and the resonators of bamboo. Elsewhere the keys are of wood and the resonators are gourds or wooden boxes (except in the orchestral instrument, which has brass tubes). In South African mining compounds marimbas are made from floor boards and tin cans. In Africa and Central America the resonators usually have a hole near the bottom covered by a membrane which adds a buzz to the tone. The instrument is invariably played with soft beaters. The tuning always follows the two original Javanese scales, the pentatonic *sléndro* and the heptatonic *pélog* (see *GAMELAN*). The marimba was used in 20th-century works by C. M. Loeffler, D. Milhaud and P. Creston.

MARIN, JOHN (1872–1953), U.S. painter, whose great contribution was a dynamic expression of vivid perceptions, best known for his water colours, was born in Rutherford, N.J., on Dec. 23, 1872. (His full name, never used, was John Cheri Marin III.) His mother died a few days after he was born, and he was brought up by her relatives. After some practice of architecture, Marin studied painting at the Pennsylvania academy in Philadelphia and the Art Students league in New York. In 1905 he went to Europe for six years and returned permanently to the United States in 1911. In Europe he was influenced by Whistler in both etching and water colour; there, too, commenced his association with Alfred Stieglitz, so important to them both. Marin's technical experimentation found direction after he saw European work at Stieglitz's "291" gallery and at the New York Armory show (1913). In 1914 he married Mary H. Hughes, who died in 1945. Their permanent home was at Cliffside Park, N.J.

Marin's financial success was achieved through Stieglitz's handling of his output; his artistic stature was established for the general public by the retrospective exhibition at the Museum of Modern Art, New York, in 1936. His technique in water colour by 1920 was brilliant, as in "Lower Manhattan" (privately owned). Eventually he attained an equivalent intensity in oil. In 1948 he received the Fine Arts medal of the American Institute

of Architects. He died at Addison, Me., on Oct. 1, 1953.

MARINDUQUE, an island and, together with several off-shore islets, a province of the Philippines, located south of central Luzon and east of Mindoro. Area 355 sq.mi. Pop. (1960) 114,586. Over 30% of the total land is in farms. Coconuts, for copra production, and rice are the leading crops. The provincial capital is Boac (pop. [1960] 26,712). An iron mine at Mogpog, 3 mi. north of Boac, provides employment for about 500 persons and is the leading nonagricultural industry. (R. E. HE.)

MARINE BIOLOGY is the science that deals with animals and plants that live in the sea. It also deals with air-borne and terrestrial organisms that depend directly upon bodies of salt water for food and other necessities of life. In the broadest sense it attempts to describe all vital phenomena pertaining to the myriads of living things that dwell in the vast oceans of the world. Some of its specialized branches concern natural history, taxonomy, embryology, morphology, physiology, ecology and geographical distribution. Marine biology is closely related to the science of oceanography because of the relationship of the physical features of the oceans to the living organisms that dwell in them. It aids in the understanding of marine geology through the study of those organisms that contribute their skeletal remains to the floors of the oceans, or that elaborate the vast coral reefs of the tropic seas.

Knowledge of marine biology is essential to certain aspects of human welfare. Intelligent regulation of the commercial marine fisheries would be impossible without a thorough understanding of the biology of commercial fishes. The prevention of fouling of ships depends on the knowledge of factors that interfere with biological processes of fouling organisms. Survival at sea by means of life rafts and lifeboats often depends on the utilization of various kinds of marine life for both food and water. The rapid increase in the human populations of the world has indicated a need for greater use of the marine products, which may be made more easily available through contributions of the knowledge gained in the study of marine biology.

THE MARINE COMMUNITY

ENVIRONMENT

The great oceans and adjacent seas comprise approximately 70% of the surface of the earth, with a volume of more than 1,000,000,000 cu.km. The greater part of this vast marine environment is suitable for the existence of large numbers of living organisms; and no part, not even the blackest, coldest depths, has been discovered to be completely devoid of life. The upper layers of the oceans, effectively illuminated with sunlight to depths as great as 200 m., support the existence of pigmented plants that elaborate primary food materials by photosynthesis. Mineral salts are available for the use of living material during growth, the relative concentration of these salts approximating those of the body fluids of most marine organisms. Oxygen is present in concentrations sufficient for respiration in all but a few zones of the oceans; but even the oxygen-deficient zones are inhabited by organisms that exist by anaerobic respiration.

The temperature ranges of -2° to 30° C. (about 28° to 86° F.) are well within the limits favourable to most living organisms. In addition the density and viscosity of sea water are such that it affords an ideal flotation medium for the numerous organisms, large and small, that dwell within it. See *OCEAN AND OCEANOGRAPHY*.

ORGANISMS

The sea contains a vast assortment of living things, including the smallest and the largest that inhabit the world. Discounting the submicroscopic bacteriophages (viruses that attack bacteria) that have been isolated from coastal waters, the smallest forms that can definitely be called living are bacteria. Invertebrate animals range in size from tiny protozoa, barely visible under the highest power of an ordinary optical microscope, to the giant

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART, THE ALFRED STIEGLITZ COLLECTION, 1949
"LOWER MANHATTAN FROM THE RIVER, NO. 1," JOHN MARIN, WATER COLOUR. IN THE METROPOLITAN MUSEUM OF ART

deep-sea squid *Architeuthis*. Vertebrates range from tropical fishes less than 1 in. long when mature to the great blue whale, which may attain 100 ft. in length and 150 tons in weight.

Plants.—Bacteria.—Many bacteria in the sea perform the important function of decomposing the dead bodies of larger organisms to release their elementary substances as primary nutrients for plant growth. These bacteria are generally scant in the open waters but become numerous near the coast lines, where organic matter is abundant, and also on the surface of the sea bottoms, where detritus accumulates. Terrestrial bacteria, especially those of human origin, often become abundant in bays and estuaries. These bacteria are not marine in the strict sense because they are unable to grow and reproduce in the marine environment. However, since they are able to survive in the sea for long periods of time, may be dangerous pollutants and are continually replenished in large supply from the land, they are given an important place in the marine community. (See also BACTERIA.)

Algae.—Most of the marine plants belong to the algae, a collection of primitive phyla characterized by the absence of a vascular system, and by a reproductive mechanism that does not require the formation of flowers and seeds. The largest and most diverse group of plants consists of microscopic unicellular forms that abound everywhere in the illuminated upper waters of the oceans, where they synthesize the greater part of the primary food that supports the marine community. Reproduction is accomplished by simple cell division. When conditions are unfavourable, resting spores are formed which germinate when the situation improves. The rate of reproduction of algae depends to a large extent on the availability of nutrient salts of nitrogen and phosphorus, which, however, are most abundant in the deep unlighted waters where they cannot be utilized. Consequently, the greatest production of unicellular plants occurs where there is upwelling of the deep, nutrient-rich water; the primary food synthesized in these localities often provides the basic supply for prosperous commercial fisheries.

The macroscopic marine plants are represented by seaweed—certain red, green and brown algae—with flowering plants being represented by the eelgrasses and the salt-marsh grasses. The three groups of seaweed are generally anchored to the bottom or some solid structure by rootlike holdfasts that perform the sole function of attachment and do not extract nutrients from the soil as do the roots of the higher plants. Seaweeds often form dense accumulations in shallow water; but their restricted zonation along the margins of the seas, where the depth is 50 m. (about 165 ft.) or less, detracts from their importance as primary food producers.

One group of red algae, the Corallinaceae, contributes in the formation of coral reefs. Members of this group form resistant encrustations on the seaward surfaces of reef corals. A green alga, *Halimeda*, also contributes to the formation of coral atolls by depositing its platelike calcareous skeleton on the floors of lagoons. (See also ALGAE; CORAL REEF.)

Higher Plants.—The eelgrasses and saltmarsh grasses, marine representatives of the angiosperms, have true roots, and obtain their nutrients from the mud and sand in which they grow. Both groups reproduce by forming true flowers that are pollinated and produce seeds. These grasses have an important effect on the formation of geological structures in bays and estuaries, where they entrap water-borne sediments, thus forming mud flats, sand bars and marsh banks. Marsh grasses, growing at or near the high-water level on coasts where the sea level is constantly rising, build up layers of peat, some of which are several metres thick.

It is curious that few animals browse directly upon the larger marine plants. However, the sea hare *Tethys*, some other gastropods, and a few kinds of fishes feed on seaweed, and the manatees, or sea cows, eat other large plants. In general the importance of the larger plants in the marine communities depends upon their providing hiding places and means of attachment for animals. After death they contribute to the organic content of the sea as detritus.

Animals. The animal kingdom presents a spectacular array of forms and sizes in the sea. It is represented by all the major divisions (phyla), of which five are exclusively marine, namely,

the Ctenophora (comb jellies), Echinodermata (starfish and urchins), Chaetognatha (arrowworms), Brachiopoda (clams), and Phoronida (tufted tube worms).

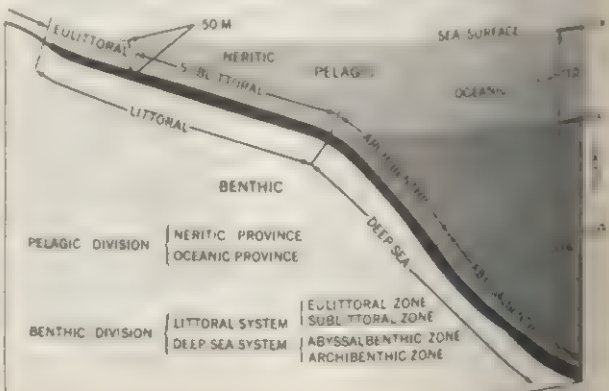

Vertebrates.—All classes of vertebrates except the Anura are represented in the marine community. The fishes are numerous and diverse. The reptiles include the true sea snakes and turtles. Certain birds, such as the penguins, have adapted to flight and spend the major part of their lives swimming and waddling near the sea. Others, such as the albatrosses, spend the oceans for long periods of time and only return to land to nest. The fish-eating cormorants are powerful underwater swimmers that pursue their prey to considerable depths below the surface of the sea. The principal mammals that are exclusively marine are whales, porpoises and sea cows; these are so adapted for the aquatic environment that they cannot leave the sea at any time. Others, including the seals, sea lions and sea otters, normally live in the sea but are able to move on land for various purposes.

Invertebrates.—The forms and modes of life of the marine invertebrates are extremely diverse. The mud and sand of the ocean's bottom teem with burrowing worms, mollusks and crustaceans. The surface of the sand may be covered with brittle stars, sea urchins and sand dollars where conditions are favourable. Certain coelenterates and bryozoans form colonies, free floating or attached to solid surfaces. Extreme specialization occurs in the siphonophore coelenterates in which individual members of the colony are modified for such diverse functions as swimming, flotation, food catching, ingestion and reproduction. The gigantic coral reefs of the tropical seas are, to a large extent, formed from the skeletal secretions of colonial corals and other invertebrates.

The Crustacea (q.v.) are probably the most numerous invertebrate group in the marine habitat. The vast majority swim in the upper waters, feeding on phytoplankton and organic detritus, and in turn providing the primary source of food for many pelagic fishes as the herrings and mackerels. Certain crustaceans, such as crabs, lobsters and crayfish, inhabit the bottom, where they feed on dead organisms. Others, such as the barnacles, have adopted a completely sedentary mode of life in the intertidal condition: they become firmly cemented to solid surfaces, their legs being modified into food-gathering organs that sweep the adjacent waters for organic detritus and small organisms.

ZONATION

The marine environment is divided into arbitrary zones by means of convenience (see diagram), and the organisms are divided into categories determined by habitat and local behaviour. The two main divisions of the sea are the pelagic, the former comprising the entire sea bottom and the latter, all the overlying water. All organisms that live in the mud, attach to solid surfaces or crawl on the bottom are logically classified as living in the benthos. Organisms in the pelagic division are classified as nekton if they are active swimmers and as plankton if they are weak swimmers.

FROM OVERDUP, JOHNSON AND FLEMING, "THE OCEANS" (PENGUIN, 1960)

THE MAIN DIVISIONS OF THE MARINE ENVIRONMENT

drifters. Planktonic plants such as diatoms, photosynthetic dinoflagellates and other floating algae are known as phytoplankton. Planktonic animals, which include a host of drifting forms, comprise the zooplankton.

The scheme of marine zonation followed in this article is a time-honoured one; other classifications, found in the articles *ANIMALS*, *DISTRIBUTION OF*, and *ECOLOGY*, are also widely used.

Sea Floor.—The benthic division may be divided into a littoral system that extends from the shore to a depth of 200 m. and a deep-sea system extending down to the greatest depths. The littoral system may be further subdivided into a eulittoral zone, extending from the high-tide mark to the 50-m. contour, and a sublittoral zone, to the edge of the continental shelf. (The 50-m. depth is chosen because it represents approximately the greatest depth at which attached plants can grow.)

The kinds of things that grow in the littoral system depend to a considerable extent on the type of bottom and on the degree of exposure to wave action. Exposed sandy coasts generally develop sparse populations, especially between the tide lines. Also the few organisms inhabiting wave-swept rocky shores are generally firmly cemented to the substratum. Protected bays and inlets often develop rich populations. Protected rocky shores are generally covered with seaweeds, mussels, barnacles, etc., and with various kinds of crabs and worms crawling among them. Sandy and muddy bottoms teem with burrowing mollusks, worms and echinoderms in localities where headlands and projections protect the environment from violent wave action. The sublittoral zone, which receives a considerable amount of organic matter from the shoreward area and from the waters above, is particularly rich in animal life; it is there that important ground fisheries are located.

More than 90% of the ocean bottom is included in the deep-sea system. A detectable amount of light penetrates the shallower (archibenthic) zone, but it is in such reduced amounts that no plant growth can occur. Beyond the 1,000-m. contour the abyssal-benthic zone remains in perpetual darkness. The entire deep-sea system depends on food produced in the upper lighted zones; this food drifts downward in limited quantities, restricting the numbers and kinds of animals which can depend upon it for existence. Most deep-sea animals are therefore small and inconspicuous.

Open Water.—The pelagic division may be divided into the neritic province, which overlies the littoral area, and the oceanic province, which occurs over the deep-sea system. The entire neritic province receives sunlight and may develop rich blooms of phytoplankton, aided by contributions of nutrient salts from the nearby land and the shallow bottom. The zooplankton, which is rich on the phytoplankton, is characterized by the presence of a number of temporary forms, including the larval stages of benthic animals. These are scarce in the oceanic province because of their distance from adult populations and also because of the scarcity of such animals in the deep-sea system.

The upper illuminated section of the oceanic province is termed the upper pelagic. There the phytoplankton may develop in places where oceanographic features bring up nutrient salts from the deeper waters below. Animal life may be abundant that important tuna and other pelagic fishing may be profitably pursued. In the unlighted abyssal-pelagic zone few animal populations become sparse. The fishes of this region are generally small, dark in colour and often equipped with light-producing organs.

ADJUSTMENTS TO LIFE IN THE SEA

The principles of general physiology of marine organisms are essentially the same as those that apply to fresh-water and terrestrial organisms. All living things extract substances from their surroundings to provide materials for growth and for energy to maintain the living processes.

Reproductive Patterns.—*Bacteria and Algae*.—In the plant world in the marine bacteria and microscopic algae reproduce by simple cell division. Favourable conditions may increase the rate of reproduction to such an extent that dense local accumulations, known as "blooms" may occur. Abnormal blooms of certain poi-

sonous dinoflagellates (*g.v.*) are not uncommon in the warmer seas where, as "red tides," they colour the water and kill vast quantities of fish with their toxic secretions. These substances are of such virulence that shore resorts are at times made uninhabitable because respiratory irritations result when these poisonous substances are transferred to the air by breaking waves. The macroscopic algae typically reproduce by spores that germinate into inconspicuous male and female plants, called the gametophyte generation. Fertilization then takes place and the new sporophyte generation is produced (*see ALGAE: Form and Function*).

Animals.—The life histories of marine animals are remarkably varied. Most sedentary forms reproduce sexually by liberating eggs and sperm into the water, where fertilization takes place. Typically this is followed by a larval stage with the swimming larva quite unlike the adult. After a free-swimming existence, a period of days or weeks, the larva undergoes metamorphosis and assumes the adult form. Fertilization is internal among the majority of the crustaceans. The young grow by molting or shedding their shells, and pass through a number of successive larval stages before the adult form is attained.

As a rule, the reproductive and developmental patterns of marine animals fall into one of three general categories: (1) internal fertilization, with parental protection of the early stages of development, the offspring numbering in the hundreds or less, as in certain gastropods; (2) internal or external fertilization, with some provision for the early helpless stages, the offspring numbering in the thousands, as in many bottom-dwelling crustaceans; and (3) external fertilization, with no provision for protection during the early stages, the offspring numbering in the millions, as in most mollusks, echinoderms and many fishes.

The type of fertilization determines to a considerable degree the extent to which populations of any animal may fluctuate from time to time. Certain snails lay small numbers of eggs in resistant capsules that protect the embryos until they become well enough developed to cope with their environment. Populations of such snails tend to remain relatively constant, with only gradual fluctuations over long periods of time. Many of the bottom-dwelling crustaceans fertilize the eggs internally and attach the fertilized eggs to special appendages. The eggs are then carried on the mother through the early stages of development and are finally hatched as free-swimming larvae in an advanced stage. To ensure some survival in the subsequent precarious free-swimming existence, the eggs usually number from the hundreds to the tens of thousands. Populations of animals with this kind of life history fluctuate to a considerable extent, depending on how the conditions of the environment favour survival during the free-swimming period. Most mollusks, echinoderms and many commercial species of fish produce millions of eggs per female. These are fertilized externally and then are abandoned to fend for themselves, through a prolonged period of helpless developmental stages. Survival during this period depends on the presence or absence of predators, the strength and direction of currents, and the suitability of the physical and chemical factors of the environment. So many factors or combinations of factors may influence the survival of each generation that populations of organisms with this mode of reproduction tend to exhibit extreme variations from one year to the next. Occasionally circumstances may permit such a high degree of survival of a single generation that its constituents may outnumber all other members of the population for several years. Such a generation is known as a dominant-year class and is of considerable importance to the commercial fisheries.

Salt-Water Balance.—Composition of living matter must be maintained within narrow limits with respect to the water content and to the concentration of various mineral salts. The problems of maintaining the required composition are accomplished by marine organisms in a number of ways.

Most naked or thinly-covered marine organisms have little difficulty in coping with their environment because the composition of their blood approximates that of sea water with respect to the major salts. They are thus able to carry out their living processes without expending large amounts of energy in concentrating or eliminating water and mineral substances.

The blood of many of the fishes, however, is less concentrated (hypotonic) than sea water, and special mechanisms are necessary to prevent loss of water through the body membranes by osmosis (see also FISH). In most fishes the walls of the digestive tract are permeable to solutions of mineral salts, so that sea water (with its salts) ingested by these species can pass into the blood stream. Special organs on the gills extract the excess mineral salts from the blood and excrete them into the waters outside the body. The salt concentration of the blood is thus reduced to an optimal level.

Certain species of cartilaginous fishes (sharks, skates and rays) accomplish the task of regulating their salt concentrations in a different fashion. Instead of expending energy in secreting salts against the osmotic gradient, they conserve their nitrogenous wastes in the form of urea, which is retained in the blood in concentrations sufficient to make it the osmotic equivalent of sea water.

A number of crustaceans that invade the variable dilute waters of the estuaries are faced with the problem of surviving in a medium that is less concentrated than their blood. Consequently water flows into their bodies by osmosis. These forms are generally protected over most of the body surface by impermeable shells; and the excess water entering through the reduced permeable area is eliminated with considerable expenditure of energy by means of special kidneylike organs.

The cellular fluids of many marine plants differ considerably from the surrounding sea water in their relative concentrations of sodium and potassium. In effect, these plants appear to concentrate potassium, and in doing so must eliminate sodium in order to maintain the total salt concentration of the cellular fluid at a level equal to that of sea water. The elimination of excess sodium is accomplished by means of a "sodium pump," which operates in some unknown manner but which may be stopped by substances that inhibit the organism's utilization of energy-supplying substances.

Oxygen Levels and Metabolism.—Organisms that live between the tide lines, such as clams and oysters, are deprived of oxygen-bearing water at each low tide. The end products of metabolism, formed during this period of anaerobiosis, are acidic. These are temporarily prevented from injuring the organism by being neutralized by the calcium carbonate of the shell, at which time the organism incurs an "oxygen debt." This temporary debt is paid off by an increase in oxygen consumption when the oxygen-rich waters flow over the organism at high tide, the accumulation of metabolic products then being eliminated by oxidation.

Periodicity.—Certain tidal organisms exhibit rhythms in behaviour, or rates of metabolism, which correspond to tidal periods. These peculiarities persist even when the organisms are transferred to situations where there is no tide. The oxygen consumption of some mollusks varies as much as tenfold with the phases of the tide. This variation continues in a rhythmic manner even when the organisms are maintained under constant conditions in laboratory aquariums. Such organisms collected from separate localities where the phases of the tide differ will maintain their intrinsic rhythm. Fiddler crabs that live in the intertidal zone and alter their colour patterns as the tides rise and fall, for example, continue to exhibit the same rhythmic colour variations under constant conditions in the laboratory.

Brittle stars, sea cucumbers and other voracious animals dwell on the sea bottom in dense accumulations. They require such enormous quantities of food that each generation of immature food organisms would be entirely exhausted if eaten immediately after settling to the bottom. To make efficient use of their food supply, the brittle stars and cucumbers enter a quiescent stage during the period when the food organisms are settling, and maintain their metabolic activities at a low rate until the food organisms have increased in volume through growth. In this way the food supply is extended, eliminating starvation.

Other Adaptations.—Most marine animals are heavier than the surrounding sea water; therefore, special adjustments have appeared among the various forms to offset the tendency to sink. Among these adjustments are the flotation processes of diatoms and dinoflagellates; the oil droplets in the protoplasm of many

protozoa; the gas traps in some radiolarians, some jellyfishes and notably in some large seaweeds; and the swim bladder in some fishes.

Many larger marine animals actively swim about by adaptations of appendages (fishes, whales and seals) or by ejecting water (octopods, scallops and some jellyfishes); those confined to the bottom may flip about, creep and swim to some extent, but some are sedentary, like sea anemones, corals and many large seaweeds attached to intertidal rocks. The great bulk of living substance of the sea, however, is passively adrift as plankton (*q.v.*). See also ANIMALS, DISTRIBUTION OF; LOCOMOTION, ANIMAL.

THE FOOD WEB OF THE SEA

Cycle of Food.—The marine environment is essentially a closed system in which life proceeds in a cycle determined by the nutritional requirements of the various kinds of organisms. The marine plants undergo continual grazing by hordes of herbivorous animals. Since the bulk of the plant material produced in the sea is included in the phytoplankton, the majority of the herbivorous animals are filter feeders, endowed with special structures for straining the tiny plants out of the water. The planktonic Crustacea possess filter nets of closely spaced bristles on the appendages adjacent to the mouth. Clams, oysters and mussels strain their food out of the water by means of their gills. Some worms employ mucous nets capable of extracting particles of extremely minute size from the water. These herbivorous animals, which perform the important function of converting plant materials into animal substance, are in turn subject to predation by the primary carnivores.

This group includes a vast array of forms from the tiny arrowworms, which snap at individual organisms with their formidable jaws, to the great baleen whales, which strain vast numbers of organisms for food by means of their whalebone plates. Beyond the primary carnivores are successive levels of carnivorous forms ending with the top predators. When the latter die they are decomposed by bacteria, thus releasing the elementary substances for the use of the photosynthetic plants, and completing the food cycle.

Within this general cycle of life there are a number of events that make the system complex. Death and decomposition occur at every phase of the cycle. Phytoplankton drifting down into the deep, unlighted zones of the oceans may die and decompose. Their elementary substances are then beyond the reach of their photosynthetic relatives until such time as turbulence or upwelling may return the nutrients to the illuminated water. Shrimp, fishes and other forms dying from causes other than direct predation may sink to the bottom to be eaten by scavengers such as crabs and worms before bacterial decomposition is completed. Incomplete decomposition of any dead organism may result in the production of organic detritus, which is particulate matter of indeterminate nature included in the diet of many filter-feeding species. Lastly, the general system is made complex by the fact that the metabolic activities of all organisms continue to release elementary substances through respiration and excretion, thus helping to maintain the supply of basic nutrients for the photosynthetic plants.

The great demands for energy made by living organisms, in order to maintain the fundamental living processes, necessarily limit the amount that is available to be transferred from one step to the next in the food cycle. In general every organism uses 90% or more of its food intake merely to sustain its metabolic activities and transfers less than 10% into its own substance during growth. Thus the rate of production of marine life depends upon the position of a particular species in the cycle with respect to the primary source of supply, the photosynthetic plants.

In the pelagic division the tiny herbivorous copepods and euphausiid shrimps are produced at a rate fast enough to support the feeding requirements of the giant baleen whales. Mussels, clams and oysters, which are also herbivorous filter feeders, have proved to be a dependable source of food for coastal peoples throughout the ages.

The bulk of the world's catch of commercial fishes consists of

certain pelagic species, including the herrings, mackerels and menhaden, all primary carnivores, which subsist on small crustaceans and other similar organisms. At the other extreme, the very large fishes and other top predators seldom reproduce and grow at a rate fast enough to permit catches of a size approaching those of the herrings and mackerels.

Sources of Human Food.—Man has depended on the sea for part of his food supply since prehistoric times. Human preferences have tended toward the larger fishes because they are relatively easy to capture by means of both primitive and advanced types of fishing gear. However, these larger fishes are generally one or more levels removed from the primary source of food and are therefore produced at a reduced rate, as already described. As a typical example, it has been shown that the yield of a single population of haddock to the commercial fisheries represents less than one-thousandth of the total quantity of living material synthesized by the plants growing in the waters over the fishing grounds.

The increasing need for human food has stimulated interest in making more efficient use of the productivity of the oceans. Preliminary estimates showed that the yearly production of primary food materials approximated three tons per acre when measured as dry plankton. However, two major difficulties prevented extensive use of this enormous crop for human food. The vast majority of the photosynthetic plants and the herbivorous zooplankton that subsist on them are exceedingly minute—seldom more than of microscopic size. The problem of separating such organisms from the waters is vastly more complicated than that of netting even such small fishes as sardines or anchovies. In addition, the cycle of life in the sea proceeds at such a rapid rate that the phytoplankton are consumed by the zooplankton about as fast as they grow. The herbivorous zooplankton in turn are limited constantly by the continual predation by larger forms. The final result of this rapid turnover is a low standing abundance of the groups of organisms that are produced at the highest rate, the phytoplankton. It thus appears that man must continue to depend on the larger carnivorous fishes even though they represent an infinitesimal fraction of the total amount of food produced in the sea.

Some progress was made during World War II in the use of zooplankton as an emergency source of food for survivors on lifeboats and rafts. Various kinds of zooplankton were tested as to their nutritive value and palatability. The results of these tests indicated that the commonest forms would sustain life for some time and that the taste and consistency was generally acceptable.

Considerable attention has been given to the possibility of increasing the production of such herbivorous mollusks as mussels, clams and oysters, by modifying local conditions to favour the desired species. These species are so close to the primary source of food that their production, in limited localities, surpasses that of any other kind of edible animal material. Oysters and mussels have been farmed for centuries by providing suitable surfaces for attachment and by eliminating predators and competitors.

In a few instances it has been possible to apply principles of marine biology to the deep-sea fisheries in order to locate new supplies and to regulate the degree of exploitation that would maintain the optimal sustained yield. Knowledge of the hydrographic features along the borders of the equatorial currents of the Pacific has made it possible to discover productive tuna populations. An understanding of the population dynamics of Pacific halibut has made it possible for the interested nations to regulate the total catch by international agreement and thus to prevent the wide fluctuations in the availability of this species that result from overfishing. Similarly, a number of nations whose fishermen depend on the haddock resources of the northwest Atlantic agreed to regulate the size of the mesh of the trawls employed in this fishery. In this way the young haddock are allowed to escape so that they may grow to marketable size in greater numbers. This regulation was enacted after years of study of the biology of the haddock, the extent of the resource and the effect of various fishing methods.

See also FISHERIES; FISH CULTURE: *Regulation of Fishing for Best Yield.*

RESEARCH METHODS

During the last half of the 19th century, when emphasis was placed mainly on the collecting and cataloguing of marine organisms, the methods employed in marine biology were directed toward the capture and preservation of specimens for study. Various kinds of dredges and trawls were used to collect specimens from the bottom; and hoop nets of different sizes were employed in securing pelagic specimens. The vast multitude of marine species has made it necessary to continue to employ such methods up to modern times. The first half of the 20th century, however, saw a shifting of the emphasis toward quantitative and dynamic aspects of the science, for which refined methods and the use of more complex tools were required.

Equipment to determine the physical features of the marine environment was developed with a considerable degree of precision. Among the instruments devised were thermometers to determine the temperature at any desired depth and containers that close automatically to bring water samples to the surface for analysis. New analytical methods made possible immediate determinations for salinity, oxygen, nutrient salts and plant pigments on shipboard. Also developed were photoelectric devices for measurements of light penetration and a variety of coring instruments for collecting bottom sediments.

Even the collecting apparatus underwent a high degree of refinement. Qualitative hoop nets gave way to quantitative samplers that may be lowered in a closed position to any desired depth, opened, towed and closed again. The exact amount of water filtered through the fine silk netting is accurately determined by propellers and counters. Continuous sampling is accomplished by a filtering device whereby a band of fine netting is moved across an opening and then is rolled up in a tank of preservative. Such samplers may be towed long distances behind commercial vessels and require only a small amount of attendance by unskilled personnel.

Direct observation of marine organisms in their natural habitats has been made possible by underwater cameras, television and improved diving equipment. Cameras have been devised that function in the greatest depths by means of light produced by commercial photographic flash bulbs or xenon-gas discharge tubes. Underwater television provides the observer with a continuous picture of events that occur within the field of his submerged camera. The development of self-contained diving equipment made it possible for the investigator to inspect personally marine organisms in their natural habitat.

The rate of production of primary foods by the photosynthetic plants is determined by dark and light bottle experiments and by the use of radioactive isotopes of various elements. Dark and light bottles filled with sea water of known oxygen concentration and containing a normal population of organisms are suspended in the sea for a given time. Photosynthesis that occurs in the light bottles is determined by the increase in oxygen. A comparison is made between the oxygen concentration in the water in the light bottle, determined after a finite time, with that of the water at the time of filling; the result gives an indication of the amount of food produced.

Corrections for losses of oxygen by respiration are determined from the oxygen content of the dark bottle. More direct determinations of this primary productivity are made with the aid of radioactive isotopes. Light bottles filled with water containing normal populations are supplied with small quantities of salts of radioactive carbon and suspended in the sea. After a period of photosynthesis, the organisms are filtered off and the amount of carbon fixed in their bodies is determined by Geiger-Müller counters.

The properties of isotopes have also been used to determine climatic conditions in earlier times. It was discovered that the ratio of the commonest isotope of oxygen, O^{16} , to O^{18} in the calcium carbonate of shell-forming organisms is influenced by the surrounding temperature at the time of the formation of the shell. Therefore the climate in which a number of prehistoric organisms lived is determinable by analysis of their fossil remains.

Morphological and taxonomic studies of marine organisms are

generally performed on preserved materials in connection with the work in museums and universities. Physiological and embryological investigations requiring the use of living material are generally pursued at biological stations. These are situated on the seacoast, thus facilitating the rapid transfer of specimens to the laboratory where they may be maintained in sea water provided by special circulating systems.

MARINE ENGINEERING, the branch of engineering that is concerned with the design, construction and administration of machinery installations afloat. The title marine engineer usually designates the men ashore who are occupied with such installations in technical or administrative capacities. It does not normally refer to the activities of the officers and crew who are responsible for the daily operation of their vessel's machinery; they are usually called engineer officers and engineers to distinguish them from deck officers and deck hands.

Marine engineering and naval architecture are often used together to comprehend the entire engineering function involved in design and construction of ships. The demarcation between the responsibilities of the naval architect and the marine engineer is not rigid, but in general the primary responsibility of the marine engineer is the propulsion machinery of the ship, while her form and structure are in the hands of the naval architect. Auxiliary machinery of various kinds may be assigned to either one or the other, and in some shipyards and design offices the electrical installations are the province of an electrical engineer who is not responsible directly to either the marine engineer or the naval architect.

As in other disciplines of engineering, those who practise the profession of marine engineering may have prepared themselves either by formal university-level training or by practice and experience. The number of those who have been formally educated as marine engineers in the English-speaking countries is not large. In Great Britain, marine-engineering education has been mainly a branch of mechanical engineering. In the United States it has usually been administered as part of a program called naval architecture and marine engineering in the few institutions that offer courses in this field.

In any case, the core of the professional area of the specialty is the main propulsion machinery of the ship. Most installations in large ocean-going vessels transform the energy delivered by the power plant to thrust by means of one or more screw propellers at the stern of the ship. The propellers may be connected with the driving engine by direct lines of shafting, by mechanical gearing or, less commonly, by electrical transformation. The number of shafts is usually determined primarily on the basis of maximum unit engine power which can be produced and handled. In general, the smaller the number of screws the higher the propulsive efficiency.

Propulsive efficiency is the efficiency with which power delivered by the shafting (shaft horsepower, s.h.p.) is transformed into the power absorbed by the ship in uniform forward motion alone under towed conditions; i.e., without the disturbances caused by the propellers (effective horsepower, e.h.p.). Single-screw propulsion may give propulsive efficiencies of 70%–80%, while quadruple-screw propulsion may show only 55%–60%. Operating costs will generally be lower with single-screw installations largely because fewer man-hours are required for operation at sea and for upkeep. However, conditions other than efficiency may favour

multiple-screw propulsion. Even when the total power required for propulsion could be delivered by a single unit, the corresponding propeller diameter may be too large for the geometry of the stern. Vulnerability to damage of a single-engine shaft and screw favours the multiple-screw installation. A lesser consideration, except in special circumstances, is the feature of maneuverability, which clearly favours multiple screws.

TYPES OF POWER PLANTS

For large ocean-going vessels the two principal types of conventional power plants are the diesel engine and the steam turbine. Each type has a variety of forms and applications. The diesel installation may be connected directly to the propellers, or it may transmit power through mechanical gears or electrical transmission; the steam turbine, because of its high inherent speed, is always connected to the propellers through mechanical or electrical speed reduction. Nuclear propulsion has proved entirely feasible from the engineering standpoint and has displaced the conventional power plant in some special types of ships. The gas turbine, operated either with a conventional combustion system or with free-piston gasifiers, has also attracted considerable attention as a marine power plant.

The choice of power plant for a specific ship depends on many factors. Because of the obvious conditions of use, the factor of reliability is always paramount. Other factors, some or all of which may be governing in any particular design, are: power requirements and the availability and first cost of a power plant of proved form and size to meet these requirements; weight and space characteristics; fuel economy; maintenance costs; noise; vibration; personnel requirements; auxiliary compatibility; and other special features.

First cost is seldom a deciding consideration. Both the older conventional types have survived in active competition with each other, and their costs do not differ greatly. But availability of a proven plant may often decide the issue. After the decision to build a ship has been made, there is seldom time to develop completely new designs of machinery to fit her. In large vessels, bulkhead arrangements dictated by other considerations usually make space requirements a secondary matter, except in very fast, high-powered ships.

Weight characteristics, expressed usually in pounds of machinery weight per shaft horsepower, vary widely. In smaller powers the diesel usually has the advantage; in large powers, such as are needed for high-speed liners or most naval vessels, the geared turbine usually offers weight advantage. Fuel economy is related to fueling ports on the proposed itinerary of the vessel, to the proportion of time at which full power will be used and to the proportion of time spent in stand-by condition. Most merchant vessels operate normally at or near full power; naval ships cruise normally at only a fraction of full power. For continued operation at or near full power the diesel usually offers fuel-economy advantages in all sizes. Maintenance costs are determined by the estimated reliability of the plant and the cost of labour for maintenance work. The latter factor has sometimes placed the diesel at a disadvantage in U.S. vessels, where labour costs have been much higher than elsewhere, because the diesel usually requires more maintenance than a steam plant.

Numberless other factors may influence the choice of a particular type of power plant. The experience of the proposed owners, tradition and past practice exert powerful influences. European owners have shown preferences for diesel installations in circumstances where U.S. owners have chosen steam turbines, and the proportion of diesel installations in ocean-going vessels has accordingly been higher in European practice than in American.

DIESEL-ENGINE DRIVE

Engine Types.—Diesel engines for marine use are divided into two general types, the four-stroke and the two-stroke, sometimes called the four-cycle and the two-cycle. In the four-stroke engine the cycle of events required for operation is completed in four strokes of the piston or in two revolutions of the crankshaft.

The events are: compression on the first upstroke; combustion and expansion on the first downstroke; exhaust on the next upstroke; and aspiration or induction of air on the last downstroke.

The two-stroke cycle, as its name implies, is completed in one revolution of the crank, and, usually, the revolution is divisible into three approximately equal periods, viz., compression, combustion and expansion, and exhaust and scavenge. Fig. 1 shows the sequence of events diagrammatically. Only insignificant fractions of the expansion and compression strokes are lost, because the

exhaust and scavenge period occurs and is completed as the piston is approaching and leaving the bottom dead centre. Every downstroke of the main piston is a power stroke. Scavenging air is supplied by a blower, mechanically or independently driven; and the cylinder may be scavenged longitudinally, transversely or in a looped direction.

Engines are of the trunk-piston or crosshead types. In the first the crank is connected to the piston directly through the connecting rod, so that reaction to the horizontal force component of the rod results in side pressure against the cylinder wall. To

HARLAND & WOLFF LTD., BELFAST

FIG. 1.—SEQUENCE OF EVENTS IN TWO-STROKE CYCLE ENGINE

reduce unit value of this side pressure the piston is elongated, or trunked, and from this derives the name trunk-piston type. Alternatively a piston rod connects the piston to a crosshead, which in turn is connected to the crank by a connecting rod, so that the horizontal force component is resisted by the crosshead pressure on its guide, which is connected to the engine frame.

Engines are characterized as single-acting or double-acting, depending on whether a pressure cycle is operative on only one end of the piston or on both ends alternately. A further distinction arises when the exhaust valves are arranged as pistons returning energy to the crankshaft. Such an arrangement is called an opposed-piston engine. When air is forced into the cylinder under pressure instead of being aspirated in at atmospheric pressure, the engine is referred to as being pressure-charged or supercharged.

During the first 15 years of marine application, the most successful engine type was the four-stroke, single-acting, crosshead design. The transverse-scavenged, two-stroke single-acting engine was next in popularity. As a pressure-charged unit the four-stroke single-acting engine persisted for many years more. In the mid-1920s the double-acting four-stroke engine was introduced for higher-powered vessels, but, after a few years, it was discarded as being too complicated for ready overhaul. At this time the double-acting, two-stroke, longitudinally-scavenged engine followed. The design was successful in service, but the time and labour needed in port for overhaul precluded its wide acceptance.

Out of this long period of evolutionary activity in several countries and as the result of the independent experience of many builders, the pressure-charged, longitudinally scavenged, single-acting two-stroke engine has emerged as a widely favoured type.

Fig. 2 shows a section through a cylinder of such an engine, made by Harland and Wolff in powers from 3,000 to 8,000 brake horsepower. The bore and stroke of the cylinders are fixed in conjunction with the number of cylinders, ranging from four to eight per engine. The crankcase is isolated from the cylinder, a feature which is important when burning heavy fuels of high sulfur content. There are two pistons in each cylinder, and the scavenging is longitudinal; i.e., on the so-called uniflow principle. The lower, or main, piston controls the admission of the scavenging air through tangential ports arranged near the bottom of the cylinder liner; the upper, or exhaust, piston controls the emergence of the combustion gases through radial ports located near the top of the cylinder liner.

Each exhaust piston is operated by a pair of eccentrics, one on each side of the associated crank. Each eccentric is connected to

HARLAND & WOLFF LTD., BELFAST

FIG. 2.—LONGITUDINAL SECTION THROUGH ONE CYLINDER OF A HARLAND AND WOLFF SINGLE-ACTING TWO-STROKE ENGINE

a crosshead through an eccentric strap and rod, and each crosshead is connected by two rods to a cast-steel yoke bolted to the skirt of the exhaust piston. Although, as its primary function, the exhaust piston controls the exhaust periods, it also contributes to the engine output; the working stroke is, in fact, the crank stroke plus the eccentric stroke. Scavenge air is supplied to the cylinders, in a normally aspirated engine, by two rotary blowers that are chain-driven from the crankshaft. The advantages of the eccentric-type engine are its compactness and simplicity.

For certain types of ships, crosshead engines are not suitable, chiefly for reasons of height and weight, and trunk-type engines are installed. The first cost of a trunk engine is less than that of an equivalent crosshead engine, but a telling factor against the trunk engine is its higher consumption of lubricating oil.

Geared Diesel Engines.—The claims made for the geared drive are as follows: (1) It is more reliable because it has more than one engine per screw. (2) One or more engines can be shut down when the ship is running light, the others being operated at their most efficient rating. (3) Maintenance is easier because the engines are of more manageable size. (4) Engines can be overhauled, one after the other, at sea. (5) The machinery of a fleet of vessels of different powers can be standardized upon a single cylinder size.

For the geared diesel engine to be in a strong competitive position the engines should run at four times the propeller revolutions; they should be of crosshead design and be able to burn heavy fuel oil successfully.

Elastic Couplings.—An elastic coupling is provided between engine and gearing to serve as a cushion that will prevent the transmission of detrimental torque pulsations from engine to gearing; to function as a quick-disconnecting clutch, when maneuvering; and to limit the transmissible torque to about 1.5 to 2.5 times its normal value, thus obtaining a measure of protection if there should be a seizure in one of the engines. Such a coupling may be mechanical, electrical, hydraulic or pneumatic.

The electromagnetic coupling in wide use resembles an electric motor in construction and operation. It consists of two rotating members, axially aligned, with one inside the other; one is connected to the engine, the other to the pinion shaft of the gear system. The outer member consists of a spider connected to the pinion shaft, with salient field poles projecting inwardly from the rim. Direct current from the ship auxiliary supply activates the field windings of these pole pieces, consuming about 1% of the transmitted power. Inside the field is the inner member, with squirrel-cage winding comparable to the rotor of an induction motor, connected to the engine crankshaft. The air gap between the two parts may be from 0.2 to 0.4 in. The field when actuated causes the two members to rotate together, with only a small slip between the two. The r.p.m. of the pinion shaft is always the same as that of the engine shaft less the slip, which normally should not be more than 1% for large powers, or 2% for smaller powers.

Reduction Gearing.—The gearing is always single reduction and usually double helical. The ratio of reduction is frequently 2.5 to 1 or 2 to 1; occasionally it is as low as 1.5 to 1. The efficiency of the energy transmission from diesel engine to propeller hub is approximately 92% for a geared installation; for direct-coupled engines it is about 97%. Between the crankshaft and the tunnel shafting there is a loss both in revolutions and in torque. The slip in revolutions between engine and pinion must be taken into account when determining the gear ratio, and the loss of torque at the gearing must be considered when computing the powers.

Fig. 3 shows a typical two-engine geared arrangement. Sometimes four engines are coupled to one gear-wheel shaft, with two units forward of the gearbox and two to the rear of it.

Diesel-Electric Drive.—The claims for the diesel-electric drive are similar to those for the geared diesel drive: (1) Reliability is increased by having several engines. (2) Maintenance is easier, the engines being of relatively small size, with interchangeable parts. (3) One or more engines can be shut down at sea for overhaul. (4) With the ship running slowly or in ballast, the necessary units can generate power at their most efficient

FIG. 3.—GEARED DIESEL ENGINE ARRANGEMENT

load. (5) The total installation weight is less, and the engine-room height is much reduced. (6) The propeller and engine revolutions can be made to suit the respective requirements. (7) By varying the number of cylinders per engine and engines per ship, one or two cylinder sizes can cover the range of likely powers.

Certain additional claims are made for the alternating-current drive: (1) Power distribution is flexible, because any number of engines per shaft can be installed. (2) The engines can be located anywhere, the motors being arranged aft. (3) The engines are nonreversible. (4) Complete bridge control can be obtained. (5) A quicker turn-round in port can be arranged, based upon a system of running overhauling.

The operating excellence of a diesel-electric drive utilizing direct current cannot be gainsaid. Notwithstanding the varying requirements of ship speed and power, the engines rotate steadily under the most favourable conditions; maneuvering and reversing affect only the propulsion motor; being nonreversible, the engines are spared the wear and tear which normally occur during maneuvering. But, except for small powers, direct-current machinery is too heavy and expensive to compete with other types. Alternating current and high voltages, however, are accompanied by certain problems. The diesel engines must always run in synchronism. For steady running this is not difficult to achieve, as speed governing within close limits is possible; also the alternators, being electrically linked, can drag the engines into synchronism. But, when maneuvering, the engine revolutions must rise and fall with those of the propeller, and at the same time synchronism must be maintained among the engines. In reversing, the engine revolutions are reduced to their minimum and then, immediately before reversing the propulsion motor, the load is completely taken off the engines. Immediately afterward, when the load is restored, the back torque transmitted from the propeller to the propulsion motor—caused by the ship's motion—may much exceed the capability of the engines at the low speed at which they may then be operating.

STEAM TURBINES AND BOILERS

There is much more scope for variation in design with steam installations than there is with internal-combustion engines. The variables include: levels of steam pressure and temperature; capacity, number and type of steam generator; superheater arrangements; number and kind of turbines; reduction gear ratios and assembly; arrangements for economizers, air preheaters, feed heating, water distillation; and so on. The economics of a steam plant are relatively more in evidence and receive more attention because, at all points, decisions must be based on careful equating of thermal gains against monetary outlay.

Pressures and Temperatures.—During World War II, steam conditions in most merchant vessels were in the range of 450–600 lb. per square inch (p.s.i.) and 750°–825° F.; a few vessels operated with more advanced conditions of 850 p.s.i. and 910° F. In the years following World War II there was a general tendency to increase both pressures and temperatures, and there were many installations in the 600 p.s.i., 800° F.; 600 p.s.i., 850° F.; and 850 p.s.i., 850° F. ranges, as well as some in the 650 p.s.i., 1,025° F. and 925 p.s.i., 1,000° F. categories. The bulk-cargo steamship "Hugo Stinnes," delivered in 1957 by the Nordseewerke, Emden, Ger., was equipped with a notable post-World War II turbine installation, employing steam at 1,200 p.s.i. and 950° F.

Steam Generators.—From about 1860 to the early 1900s the Scotch boiler was in common marine use and represented the optimum development of the fire-tube boiler. In this type, the water space was pierced by many tubes through which the combustion

FIG. 4.—BABCOCK AND WILCOX MARINE WATERTUBE BOILER, INTEGRAL FURNACE TYPE

gases passed, transferring their heat to the water. For marine propulsion such boilers were almost entirely superseded by the watertube boiler, though the Scotch type persisted in some auxiliary boilers for special marine use. In the watertube boiler, water circulated within the tubes; combustion gases were outside. Two general types of such boilers were in common use in the marine field, the sectional-header and the drum (express) type.

The sectional-header boiler had certain fundamental advantages. The tubes were straight and of only a few sizes. Each tube was accessible for inspection and replacement independently of any other tube. Maintenance costs were inherently less than with the drum-type boiler, and inspection procedures were easier. However, the headers, the elements of the boiler into which the tubes fitted, limited design pressures to about 850 p.s.i., since the increased thickness required for higher pressures increased the spacing between tubes in adjacent headers.

Compared with the header type, the drum type offered the important advantage of reduction in weight and space requirements. Such a boiler is shown in fig. 4. The drum type was particularly suitable for high-powered naval vessels and fast merchant ships, where power plants of large horsepower had to be installed in minimum space and where weight was of special importance. Its design pressure was not generally subject to practical limitations with welded drums and radial tube holes. However, the tubes were usually bent and were of many different lengths. The tubes could not be independently removed nor easily inspected. Drum-type boilers could not be located with the longitudinal axis of the ship athwartship because of possible tube failure during a roll; header-type boilers did not suffer from this limitation.

Steam Turbines.—The earliest geared turbines were of all-impulse design. Later the high-pressure turbine embodied an impulse wheel, reducing its length. For powers of about 6,000 s.h.p. and more per screw, the standard unit became a three-turbine arrangement, in which the high-pressure turbine was impulse reaction, with end-tightened blading; the intermediate-pressure and low-pressure turbines were all-reaction; the high-pressure and low-

pressure astern turbines of impulse design were respectively fitted to the intermediate-pressure and low-pressure ahead turbines; the gearing was single reduction. The astern power was nominally 60%–65% of the ahead power.

In due course, higher turbine revolutions and double-reduction gearing brought about a further improvement in the steam-consumption rate. Under the influence of land practice, all-impulse high-pressure turbines superseded impulse-reaction designs. The standard arrangement became a two-turbine set, with an all-impulse high-pressure turbine and an all-reaction low-pressure turbine; the preferred form for the latter became a double-flow design, wherein the steam entered the turbine at mid-length and flowed toward each end, reducing the low-pressure blade lengths. The high-pressure astern turbine was overhung on the high-pressure ahead turbine, and a low-pressure astern turbine was incorporated in the low-pressure ahead turbine. Many single-screw designs had only one astern turbine, which was arranged on the low-pressure ahead turbine, the astern power being nominally 40%–50% of the ahead power.

The next evolutionary step was the introduction of the single-cylinder impulse turbine. For powers between about 1,000 s.h.p. and 10,000 s.h.p. per shaft this single-casing turbine was very satisfactory, being simple and reliable. The ahead and astern turbines were arranged on a common rotor, using a single pressure casing for both turbines, with steam entering near the middle of the casing and exhausting outward.

Gearing.—Double-reduction gearing arrangements are classified as articulated, interleaved or locked-train. Fig. 5 shows the principle of the articulated gear. The high-pressure and low-pressure turbines drive separate pinions, which mesh respectively with separate primary wheels, driving the secondary pinions through quill shafts. The secondary pinions mesh with the main wheel, driving the propeller. Articulated gearing has advantages over the interleaved type. A much stiffer gear case is obtained; the flexible quills between the first and second reduction trains reduce the inertia forces on the secondary pinion teeth, which arise from inaccuracies in gear cutting; and the accurate mutual alignment required by all gearing is confined to pairs.

In the locked-train arrangement the pinion meshes with two primary wheels which are bolted at their aft ends to quill shafts; the quills pass through the secondary pinions and drive them through fine-tooth couplings. The power is transmitted from the secondary pinions to the main wheel. Great care is necessary in setting up locked-train gearing, to ensure the proper sharing of tooth loads.

In the single-reduction geared turbine the ratio of reduction may be from 12 to 1 to 20 to 1, if the best over-all results are to be obtained; i.e., if there is to be an efficient, slow-moving propeller at one end of the line and an economical, fast-moving turbine at the other end.

For double-reduction gearing the usual ratio of reduction for the high-pressure turbine may be approximately 40 to 1 and, for the low-pressure turbine, 30 to 1; but the high-pressure turbine ratio can be as high as 60 to 1. All gearing teeth are of involute form. For primary pinions and primary wheels the teeth are $\frac{1}{8}$ in., and

HARLAND & WOLFF LTD., BELFAST

FIG. 5.—DOUBLE-REDUCTION GEARING: ARTICULATED TYPE

for secondary pinions and main wheels they are $\frac{8}{10}$ in. The propeller revolves usually about 110–120 r.p.m. for twin-screw ships and 95–100 r.p.m. for single-screw vessels.

Turbo-Electric Drive.—The turbo-electric drive presents fewer problems than the corresponding diesel-electric arrangement. The greatest power required for one propeller is obtainable from a single turboalternator. For a twin-screw installation each propeller motor is driven by its turboalternator normally, but at reduced power only one turboalternator need be used, the current being divided between the motors. Turboalternators can be run at much higher rotational speeds than geared turbines; being non-reversible, they can be simpler.

NUCLEAR POWER

From the standpoint of the marine engineer, nuclear power means utilizing the process of nuclear fission in a reactor as the source of heat, with nuclear fuel replacing conventional fuel. The differences in fuel weight are enormous. One pound of U^{235} produces as much heat as 2,300 tons of coal or 300,000 gal. of fuel oil. The weight of the nuclear fuel itself is an almost inconsequential part of the weight of a nuclear power plant. The amount of energy that may be released within a reactor is almost unlimited, and thus the power produced is approximately independent of the size of the reactor. Any amount of power within very wide limits may be produced from any size reactor if the energy can be removed from it. The limitations on the power of the reactor are, consequently, those imposed by the engineering problems in the heat-removal process.

A large number of reactor types have been studied and analyzed from the standpoint of suitability for mobile marine use. The installation in the first nuclear submarine, the U.S.S. "Nautilus," and the plant developed and engineered for the first commercial nuclear merchant ship, the NS "Savannah," were both based on the pressurized water, heterogeneous, enriched fuel, thermal reactor type. These terms are used to identify the principal features of the system. Pressurized water describes the type of coolant-moderator material. Other coolants proposed or used include boiling water, organic liquid, gas and sodium. Heterogeneous indicates the physical separation of fuel, coolant and moderator elements, in contrast to the homogeneous type in which they are mixed. Enriched fuel means that the natural uranium, which contains only 0.7% U^{235} , the remainder being U^{238} , is enriched in the U^{235} isotope for use in the plant. In a thermal reactor the neutrons are greatly slowed from their initial high energy by a moderator; if no moderator is used the reactor is called fast.

The submarine thermal reactor plant installed in the U.S.S. "Nautilus" consisted of a reactor in which U^{235} fissioned as a result of the absorption of thermal neutrons into the nucleus. Heat was transferred from the reactor into the steam generator or boiler by ordinary water (primary coolant) under pressure high enough to prevent boiling. This primary coolant water was circulated through the reactor and boiler in a closed loop by canned-rotor-type pumps. The boiler, essentially a shell and tube heat exchanger, utilized ordinary boiler feed water on the shell side at considerably lower pressures, producing steam delivered to a conventional marine-turbine condensing propulsion system. (See fig. 6.)

In the NS "Savannah," as designed under the auspices of the U.S. Maritime administration and the U.S. Atomic Energy commission, the primary system consisted of two loops with one steam generator and two main circulating pumps in each loop. The steam generators were of the natural circulation type, with bent-tube U-shell-type boilers that could supply both the main turbines and the auxiliary turbogenerator units simultaneously or independently. The main circulating pumps were driven by canned-rotor constant-speed motors with two-speed windings. The major portion of the reactor system was enclosed within a sealed and shielded containment capable of containing the products of any possible rupture in the reactor system during operation.

The power plant of the "Savannah" was designed to operate at a steam pressure of 480 lb. per square inch absolute (p.s.i.a.) with $\frac{1}{2}$ in. Hg vacuum, delivering 22,000 s.h.p. to a single propeller.

FROM SHAW TRANSACTIONS (1957); REPRODUCED BY PERMISSION OF THE SOCIETY OF NAVAL ARCHITECTS AND MARINE ENGINEERS

FIG. 6.—SCHEMATIC DIAGRAM OF A TYPICAL PRESSURIZED NUCLEAR PROPULSION PLANT. RELATIVE SIZES NOT INDICATED

It comprised high- and low-pressure main turbines and reduction gear, main and auxiliary condensers, feed water system, turbine generators and the usual auxiliaries. The estimated gross weight of the complete plant was as follows:

Propulsion system	1,150 long tons
Reactor system	600 " "
Containment and shielding	1,900 " "

A conventionally powered ship of the same dimensions would carry about 2,500 tons of fuel oil instead of the reactor system and containment, would deliver the same s.h.p., could carry about 500 tons less cargo and would be limited to 13,000 mi. without refueling. The nuclear-powered ship would have a corresponding radius of 350,000 mi. before renewal of fuel became necessary.

GAS-TURBINE PROPULSION

The gas-turbine system, eliminating steam as a transfer medium and leading the exhaust products from a combustion system direct to a turbine, obviously has interesting possibilities for marine propulsion. The gas-turbine ship "John Sergeant," converted from a Liberty ship in 1956, was the first ocean-going vessel to be propelled by a single-unit, mechanical-drive gas turbine. The gas turbine installed was an open-cycle, two-shaft regenerative machine with a 14-stage axial-flow compressor, a combustion system, a single-stage high-pressure turbine driving the compressor, and a single-stage low-pressure turbine driving a controllable-pitch propeller through a reduction gear. Maximum rating was 6,600 s.h.p. at a propeller r.p.m. of 114. The vessel on trial easily developed 7,500 s.h.p. A fuel rate of 0.523 lb. per shaft horsepower-hour at normal power was attained.

In 1965 the U.S. navy contracted for the construction of a cargo ship capable of achieving 25 knots equipped with twin-screw gas-turbine drive. The engines were the marine version of those used on Boeing and Douglas jet aircraft.

In the free-piston, gas-turbine type of propulsion, a bank of free-piston engines constitutes both the combustion system and the compressor system for a gas-turbine drive. The free-piston engine, or gasifier, is essentially an opposed-piston, two-stroke, uniflow diesel engine. Each piston is composed of a power piston and a compressor piston. Firing is by compression ignition. There is no crankshaft, the pistons being free to oscillate except for a connecting linkage to maintain phase relationship.

A free-piston engine was built in the early 1920s, but it was not until World War II, when the German navy employed free-piston air compressors in submarines, that the type achieved operating success. Two small French coasters, the "Cantenac" and "Merignac," each employing two such units, went into service in 1953 between Bordeaux and Hamburg. They achieved a high degree of reliability and economy. The first British ship designed with free-piston machinery was the ore carrier of the Ormsary class. The conversion of the Liberty ship "William Patterson" to free-piston, gas-turbine drive was completed under the auspices of

the U.S. Maritime administration in 1957 and the vessel placed in transatlantic service. The plant consisted of six free-piston gasifiers connected in parallel to two turbines which were connected to a single propeller shaft through reduction gearing.

MECHANIZATION AND AUTOMATION

Beginning in the 1950s pressures to reduce manpower requirements and improve operating efficiency of both dry-cargo and bulk-cargo ships began to be exerted on marine designers. The result was increased mechanization and automation. The basic features of most mechanization and automation systems on ships are: (1) a central control station that includes monitoring of the operation of the power plant; (2) remote control of the propulsion system over the entire range of operation from either the bridge or the engine room; (3) automatic data logging and monitoring. Implementation of these concepts is easier to achieve in a diesel plant than in a steam or gas turbine one, and the first successful applications were made to diesel equipment. In 1961 a Japanese diesel-driven cargo liner, "Kinkasan Maru," began operation with an automated engine room that had a greatly reduced crew. Several large steam-driven tanker fleets began mechanized and automated operation in the 1960s. The objective of most of these schemes was a one-man engine room watch, or unmanned engine rooms, with a maintenance crew available.

MARINE INSURANCE, a means of financial protection against loss or damage that is available to those having an insurable interest in property exposed to maritime perils. Marine insurance is thought to have been introduced into Great Britain by the Lombards in the 15th century. With the passage of time it became increasingly important in the conduct of international trade, and British practice was followed by many other countries. The Marine Insurance act of 1906 (6 Edw. VII, c. 41), which codified the law relating to marine insurance, defined a contract of marine insurance as a "contract whereby the insurer undertakes to indemnify the assured, in manner and to the extent thereby agreed, against marine losses, that is to say, the losses incident to marine adventure." Such a contract may, by its express terms or by usage of trade, be extended to protect the assured against losses on inland waters or even on land if the risk is incidental to a sea voyage. Subject to the provisions of the act, every lawful marine adventure may be the subject of a contract of marine insurance. A marine adventure exists whenever: (1) any ship, goods or other movables are exposed to maritime perils—such property being referred to as "insurable property"; (2) the earning or acquisition of any freight, passage money, commission, profit, or other pecuniary benefit, or the security for any advances, loans or disbursements, is endangered by the exposure of insurable property to maritime perils; (3) any liability to a third party may be incurred by the owner of, or other person interested in or responsible for, insurable property, by reason of maritime perils. This marine insurance safeguards shipowners, merchants, bankers, mortgagees and others who risk their property, money or credit in ventures of a maritime nature.

Legislation.—In Great Britain marine insurance was the subject of sporadic legislation up to the end of the 19th century. In 1601, during the reign of Elizabeth I, an act was passed (43 Eliz., c. 12) setting up a court of policies of insurance to arbitrate in cases of dispute, but by 1720 this court had fallen entirely into disuse and arbitration had taken its place. In 1745 the Marine Insurance act of that year (19 Geo. II, c. 37) prohibited the making of policies of marine insurance in the subject matter of

which the assured had no interest, and was intended to prohibit speculative insurances. This statute was repealed by the act of 1906, the provisions of the earlier act with regard to "no interest" policies being re-enacted in sec. 4 of the 1906 act. From the act of 1745 until that of 1906 there appears to have been no legislation of importance affecting marine insurance except certain finance acts dealing with policy duties. In the intervening period, however, Lord Mansfield, who became lord chief justice in 1756, trained a competent body of special jurors to try marine insurance and other commercial suits and founded the principles on which the comprehensive, though not exhaustive, act of 1906 is based. This act was followed in 1909 by the Marine Insurance (Gambling Policies) act (9 Edw. VII, c. 12), which imposed certain criminal responsibilities on parties to contracts of marine insurance effected by way of gaming or wagering on loss by maritime perils.

Practice.—Marine insurance is transacted through the medium of brokers who, by their expert knowledge, can select the best market in which to place their clients' risks and obtain the terms most suitable for the adventure to be insured. In Great Britain, the London market, which consists of Lloyd's (*q.v.*) and the marine insurance companies, occupies the premier position and is regarded as the leading world market, though important markets exist in the United States and in Scandinavia and other European countries.

On receipt of instructions from his client to effect insurance, the broker will prepare a "slip" or memorandum of the risk, giving the essential particulars in abbreviated form, for submission to various underwriters. Where large values are involved, several insurers will be approached and each underwriter willing to participate in the risk will indicate on the slip the amount for which he is prepared to accept liability and append his initials to his "line." The contract is then deemed to be concluded though it cannot be legally enforced until it is embodied in a properly stamped policy. Where a valid policy is in existence, however, reference may be made to the slip for the purpose of establishing the intention of the parties to the contract. In the case of Lloyd's underwriters, an underwriting agent is appointed to represent a particular syndicate or syndicates of underwriting members who share between them the liabilities undertaken on their behalf by the agent so appointed. The liability of members is personal and extends to their assets and in this respect their position differs from that of a company underwriter.

Only authorized Lloyd's brokers may place insurances at Lloyd's, but an assured may have direct contact with the companies. Where the insurance is effected through a broker, he is directly responsible to the insurers for the payment of the premium and the insurer is directly responsible to the assured for the amount which may be payable for losses. On the other hand, the broker has a lien on the policy for the amount of the premium and his charges for effecting the policy.

Disclosure and Representation.—The contract of marine insurance is based upon the utmost good faith, and the act of 1906 lays down in sec. 17 that, if the utmost good faith be not observed by either party, the contract may be avoided by the other party. So that the underwriter may make a just appraisal of the risk offered for insurance, the assured must disclose to the insurer before the contract is concluded every material circumstance of which he is aware and, according to the act, the assured is deemed to know every circumstance that in the ordinary course of business ought to be known by him. In the absence of inquiry, certain circumstances—such as any circumstance that diminishes the risk—need not, however, be disclosed (sec. 18 [3]). Similarly an agent employed to effect an insurance on behalf of his principal is under an obligation to disclose every material circumstance that the assured is bound to disclose unless it comes to the latter's knowledge too late to communicate it to the agent (sec. 19). The act further provides that every material representation made by the assured or his agent to the insurer during the negotiations for the contract and before the contract is concluded must be true; if it be untrue the insurer may avoid the contract. Representations may be either as to matters of fact or as to matters of expectation or belief: in the former case they

must be substantially correct, while in the latter they are deemed to be true if made in good faith.

The Policy.—Policies are prepared on the basis of the details contained in the slip and the lines accepted by the various insurers participating in the risk. Before World War II each company issued its own form of policy, but in Nov. 1939 a plan was devised to save time and labour whereby the Institute of London Underwriters was empowered by member companies to execute combined companies' policy, on the basis of the slip, on behalf of all companies concerned in the particular insurance. Similarly, in the case of Lloyd's underwriters, the execution of policies on their behalf is undertaken by Lloyd's policy-signing bureau and only one policy is issued for all syndicates concerned in a risk. The details that a policy must specify, as prescribed by sec. 23 of the act of 1906, were, as from Aug. 1, 1959, restricted by sec. 30(5) of the Finance act, 1959 (7 & 8 Eliz. II, c. 58), to the name of the assured or of some person who effects the insurance on his behalf. The Finance act of 1959 also repealed the former *à valorem* basis of computing stamp duty on marine policies and substituted a flat rate of 6*d.*, thereby bringing marine business into line with other branches of insurance. At the same time it removed the restriction that time policies may not exceed 12 months, though it had the effect of making it obligatory to stamp contracts of reinsurance. In practice, marine policies follow standardized lines; the hull form, applicable to the insurance of vessels generally, differs little from the cargo form, except in respect of the clauses attached to the policy. The basic form, in most cases, remains the same and is substantially identical with that incorporated in the schedule to the act of 1906 which, in turn, is based on the old common form adopted by Lloyd's in 1779, known as the s.g. form. Policies may be effected on either a time or a voyage basis, it being customary to insure hulls and allied interests for a period of 12 months, while goods are normally covered for the duration of the particular voyage.

Substantially the same basic form of policy is made to apply to the particular interest insured by the attachment of suitable clauses such as the institute hull clauses that have been drawn up by the Institute of London Underwriters and generally adopted by the market. Certain commodities, however, such as timber and rubber, have their own trade clauses. Marine policies may be either "valued" or "unvalued." A valued policy is one that specifies the agreed value of the subject matter insured which, in the absence of fraud, is binding on the insurers and represents the extent of their liability in the event of total loss. An unvalued policy, seldom encountered in practice because of the disadvantages to which it is subject, does not specify the agreed value of the subject matter but merely the sum insured and, in the event of loss, makes it necessary to ascertain the insurable value in accordance with sec. 16 of the act of 1906. Broadly speaking, the insurable value is the value of the interest at the inception of the risk plus incidental charges, including insurance. So far as goods are concerned, the disadvantage is that the insurable value does not include any margin for profit on the transaction.

Policy Proof of Interest Policies.—It is made clear by sec. 4(1) of the act of 1906 that every contract by way of gaming or wagering is void and that included in this category are policies effected "interest or no interest," or "without further proof of interest than the policy itself," or subject to any other like term. Though void, such policies are not illegal and do not constitute a breach of the Marine Insurance (Gambling Policies) act of 1909 unless the assured procures a policy without having a genuine interest or expectation of acquiring interest. Other types of policies in common use are: construction risks policies covering the construction of a vessel from the laying of the keel to delivery to the owners; port risks policies, confined to the insurance of vessels while in the confines of a particular port, and floating policies, used for the insurance of goods where regular shipments are made, which describe the insurance in general terms and leave the name of the ship or ships and other particulars to be defined by subsequent declaration.

Warranties.—In marine insurance a warranty is some particular thing that the assured undertakes shall or shall not be done—

an undertaking that some condition shall be fulfilled, affirmation or negation of a particular state of fact. It must be complied with exactly; otherwise the insurer is released from liability as from the date of the breach of warranty. The following are examples of warranties: the assured warrants that a vessel meets safety requirements on a certain date; that a vessel shall not proceed on certain voyages; that he is uninsured for a specified proportion of the risk. These are "express warranties" and must be first written upon, the policy, or contained in some document incorporated by reference into the policy. In hull insurance it is customary in Great Britain, the institute hull clauses policy is made subject to a disbursements warranty requiring the assured to pay the full amount of such disbursements as the assured may incur on such interests as the disbursements, commission and profit, on a 12 months basis.

Besides express warranties, there are implied warranties, for example, that the ship shall be seaworthy at the commencement of the voyage. The assured also impliedly warrants the adventure in respect of which he has effected insurance to be a lawful one. There is, however, no implied warranty of seaworthiness in a time policy, but if, with the knowledge of the assured, the vessel is sent to sea in an unseaworthy condition, the insurer is not liable for any loss attributable thereto. Breach of warranty is excused, under the Marine Insurance act of 1906, when there is a change of circumstance, the warranty ceases to be applicable to the circumstances of the contract, or where compliance with the warranty is rendered unlawful by any subsequent law. A breach of warranty may be waived by the insurer, and in fact it is customary, in the case of some warranties, to make provision in the policy to the effect that in the event of breach the insurer is "held covered" either at a specific premium or at a premium to be arranged. Where a warranty is broken, the assured cannot avail himself of the defense that the breach was remedied after the warranty complied with before loss.

Assignment.—The Marine Insurance act of 1906 provides that a marine policy is assignable unless it contains terms expressly prohibiting assignment and that it may be assigned either before or after loss. Where a marine policy has been assigned to pass the beneficial interest in such policy, the assignee of the policy is entitled to sue thereon in his own name; and the assignor is entitled to make any defense arising out of the contract which he would have been entitled to make if the action had been brought in the name of the person by or on behalf of whom the policy was effected. Policies may be assigned by endorsement or in any other customary manner. In practice, hull policies may not be assigned unless the insurer has consented in writing to the assignment. The cover granted, the reason being that the standard of underwriting or management is an integral factor in the rating of hull risks.

The Insured Perils.—In the body of the standard policy there appears a list of perils against which the underwriters agree to insure the subject matter. These include: perils of seas; men-of-war; fire; enemies; pirates; rovers; thieves; hostilities; surreisals; takings at sea; arrests, restraints and detentions by all kings, princes and people; barratry of the captain and mariners; and all other perils, losses and misfortunes, which in any manner shall befall the insured. These are to be construed not to be construed literally, as they embrace a much larger number of similar in kind to those expressly mentioned). These are further augmented, in the case of hull insurance, by the inclusion of the standard clauses of a collision clause and a negligence clause. The former protects the assured, in the event of a collision between the vessel insured and another vessel or vessels, for the amount of three-fourths (subject to a limit of three-fourths of the amount insured) of any sum which the assured has paid to the owners of such other vessel or vessels, by way of compensation in consequence of such collision. The negligence clause covers loss or damage to the subject matter insured directly or indirectly by accidents in loading, discharging or shifting cargo or explosives on shipboard or elsewhere; bursting of boilers, breakage of shafts or any latent defect in the machinery or hull of the vessel; with aircraft; negligence of the master, officers, crew or servants; and breakdown of or accident to nuclear installations on shipboard or elsewhere. Observations on the scope of the

perils insured by the policy are contained in the rules for construction of policy appended to the Marine Insurance act of 1906.

Exclusion of War Risks.—For very many years it has been the practice for marine policies to incorporate the "free of capture and seizure" clause in their text. The effect of this clause is, speaking broadly, to exclude from the cover such losses as are directly attributable to hostilities or warlike operations, civil war, revolution, rebellion, insurrection and piracy. Legal decisions have proceeded on the basis that "hostilities" does not mean the existence of a state of war, but means acts of hostility or operations of hostility, while "warlike operations" would include almost any movement of the combatant forces in the course of their combatant duties while exercised in the area of war. The insurance of so-called "war risks" may be placed separately in the open market or with mutual war risk insurance associations. The latter, however, confine their operations to the mutual insurance of British vessels and are largely reinsured by the British government. Whenever war risks are covered, the frustration clause becomes operative, whereby the policy is "warranted free of any claim based upon loss of, or frustration of, the insured voyage or adventure caused by arrests, restraints or detentions of Kings, Princes, Peoples, Usurpers or persons attempting to usurp power." The frustration clause counteracts the decision of the court of appeal in *Sanday v. British and Foreign Marine Insurance Co. Ltd.* (1916) 1 A.C. 650, in which it was held that goods prevented by arrests or restraints from reaching their insured destination entitled the assured to claim the sum insured, on the ground of "loss of voyage" even though the goods are undamaged and remain under the control of the assured.

Generally, the insurance of shipowners' liability to third parties is the special province of protecting and indemnity associations that operate on a mutual basis by sharing their liabilities equally among their members. Such associations also undertake the insurance of the one-fourth collision liability excluded by the standard collision clause in hull policies.

Measure of Indemnity for Loss or Damage.—In marine insurance terminology, loss and damage are almost synonymous, for a loss is often described as partial loss. The distinction to be made is between actual or absolute total loss and partial loss. According to the Marine Insurance act of 1906 there is an actual total loss where: (1) the subject matter is destroyed by a peril insured against; or (2) so damaged as to cease to be a thing of the kind insured; or (3) the assured is irretrievably deprived of the subject matter insured. In such cases, upon proof of the claim, the assured is entitled, in the case of a valued policy, to the sum insured by the policy, or to the insurable value of the subject matter insured, as defined by sec. 16 of the act of 1906, in the case of an unvalued policy. An insurance against constructive total loss, without further qualification, includes a constructive, as well as an actual, total loss unless a different intention appears from the terms of the policy. Constructive total loss is peculiar to marine insurance and has no counterpart in other branches. It consists of two things: first, the impracticability of repairing the subject matter insured by an insured peril because of the prohibitive cost of repairs in that the expenditure required would exceed the value of the property when repaired; or second, the deprivation of the property by reason of insured perils coupled with the unlikelihood of salvage or recovery within a reasonable time. In such cases, if the assured is desirous of claiming a constructive total loss, merely if substantiated payment would be made by the insurer on the basis of a total loss—it is essential that he give to the insurer on receipt of reliable information of the loss, a notice of abandonment indicating in unequivocal terms his intention to abandon to the insurer his entire interest in the subject matter insured. Failure to tender notice of abandonment renders the claim's being adjusted on a partial or "particular" loss basis. In hull insurance, a clause in the institute hull policy provides, in effect, that a constructive total loss may not be claimed unless the cost of repairing the damage (including certain admissible items) exceeds the insured or agreed value of the subject matter, as distinct from the actual value when re-

paired. In the case of vessels reported missing, after the lapse of a "reasonable" time—varying according to the class of ship and nature of the voyage—an actual total loss may be presumed.

Particular Average.—The Marine Insurance act of 1906 defines a particular average loss as a partial loss of the subject matter insured, caused by a peril insured against, and which is not a general average loss. In this context, the word "loss" includes damage. Particular average thus includes all forms of partial loss or damage fortuitously caused by an insured peril, such as stranding, collision or heavy weather damage, all of which examples come within the scope of "perils of the seas." With certain reservations, particular average losses under hull policies are subject to a 3% "franchise"; that is to say, losses below 3% of the insured value (or, in the case of separate valuations for different items of the vessel, below 3% of the appropriate valuation for the particular item) are not recoverable. If, however, the damage be occasioned by stranding, fire or collision, the 3% franchise does not apply and the claim is recoverable in full irrespective of amount. The standard franchise may be, and commonly is, replaced by agreement by a fixed sum to be deducted from all particular average claims, either singly or from the aggregate of all such claims occurring on a round voyage. (See also AVERAGE.)

Measure of Indemnity.—The Marine Insurance act of 1906, sec. 69, provides that where a ship is damaged, but is not totally lost, the measure of indemnity, subject to any express provision in the policy, is as follows: (1) where the ship has been repaired, the assured is entitled to the reasonable cost of the repairs, less the customary deductions, but not exceeding the sum insured in respect of any one casualty; (2) where the ship has been only partially repaired, the assured is entitled to the reasonable cost of such repairs, computed as above, and also to be indemnified for the reasonable depreciation, if any, arising from the unrepaired damage, provided that the aggregate amount shall not exceed the cost of repairing the whole damage, computed as above; (3) where the ship has not been repaired and has not been sold in her damaged state during the risk, the assured is entitled to be indemnified for the reasonable depreciation arising from the unrepaired damage, but not exceeding the reasonable cost of repairing such damage, computed as above. The reference to customary deductions, which signifies an allowance to be made because of the replacement of old material by new, is no longer of importance as standard clauses provide for the payment of both particular average and general average without deduction "new for old." The reasonable cost of repairs will include all necessary expenses such as towage and dry dock dues incurred in order to effect the repairs. Unlike other branches of insurance, the sum insured by the policy is not reduced by reason of claims paid and therefore does not have to be reinstated to provide a continuation of full cover; in marine insurance the insurer is liable for successive losses during the currency of the policy, up to the limit of the sum assured in each case.

Similar principles apply in respect of particular average on cargo, but there are also important differences. The Marine Insurance act of 1906 provides that, where the whole or any part of the goods or merchandise insured has been delivered damaged at its destination, the measure of indemnity is such proportion of the sum fixed by the policy, in the case of a valued policy, or of the insurable value in the case of an unvalued policy, as the difference between the gross sound and damaged values at the place of arrival bears to the gross sound value. In other words, the measure of depreciation has to be ascertained by comparison between the gross sound and damaged values at destination, and the percentage thus obtained applied to the insured value of the goods in order to ascertain the liability of insurers. The application of the franchise in cargo insurance is more complicated, in that certain goods are warranted free from particular average entirely, unless the ship be stranded, sunk or burned, others free from particular average under 1% (i.e. 25 per cent) unless the ship be stranded, sunk or burned, and all other goods free from particular average under 3%. In practice, however, the effect of this franchise is considerably modified by the attachment of institute cargo clauses which make the insurer liable to pay, without reference to

the franchise, the insured value of any package which may be totally lost in loading, transshipment or discharge; loss of or damage to the interest insured which may reasonably be attributed to fire, explosion, collision or contact of the vessel with any external substance; or to discharge of cargo at a port of distress. Where the institute all-risks clauses are used, no franchise applies whatever and claims are payable irrespective of percentage unless the loss or damage is due to delay, or to the inherent vice or nature of the subject matter insured, which would, by virtue of special provision in the clauses, exonerate the insurer from liability therefor.

General Average and Salvage.—General average is a doctrine of equity having its roots in the old Rhodian laws and exists apart from insurance. The fundamental principle involved is that, where a sacrifice of someone's property is made in time of peril to save the common adventure, the owners of property saved by the sacrifice shall contribute, according to the value of their property, to make good the loss sustained by the owner of the sacrificed property. In the course of time, uniformity of practice in the treatment of cases of general average became an imperative need, for many countries evolved their own codes of law pertaining to this subject. Since 1890 standard practice has largely been ensured by an international set of rules known as the York-Antwerp rules. The York-Antwerp rules of 1950 govern the adjustment of general average and provision for their application is made in the vast majority of bills of lading and contracts of affreightment. These rules embody the basic principles of a general average act and enumerate various circumstances in which allowances in general average may be made. So far as insurance is concerned, the marine policy protects the assured against his liability to contribute in general average and, if it should so happen that the property of the assured himself has been sacrificed, then the insurer is liable to indemnify him to the full extent of the sacrifice and, in turn, recoup himself, by way of contribution, from the other parties to the adventure. Where the insurer is called upon to reimburse a general average contribution, due from the property insured, he is liable for the full amount of that contribution only if the subject matter insured has been insured for the full value upon which it has been made to contribute in general average and, generally speaking, the value for contribution to general average is the value obtaining at the final port of discharge from the ship.

The definition of a general average act given in the York-Antwerp rules of 1950 is to the effect that there is a general average act only when any extraordinary sacrifice or expenditure is intentionally and reasonably made or incurred for the common safety for the purpose of preserving from peril the property involved in a common maritime adventure. Among examples of general average may be quoted: (1) jettison of cargo carried in accordance with the custom of the trade; (2) damage sustained by a vessel in refloating, at the risk of damage, from a stranded position; (3) expenses incurred in entering and leaving a port of refuge to which resort is made either for the common safety or to enable necessary repairs to be effected; and (4) loss of freight arising from loss of cargo in the course of discharging or reloading at a port of refuge to enable such repairs to be effected.

Salvage.—Salvage, strictly speaking, connotes the remuneration payable to third parties for rendering meritorious services to maritime property in distress, especially in cases where human life is endangered. It has to be borne in mind, however, that the mere saving of life does not entitle the salvor to reward, but if property is saved as well the award will be increased by reason of the saving of life. Salvors who render such services are entitled to an appropriate reward; in Great Britain the reward is decided by the admiralty court unless a fixed amount, or, alternatively, resort to arbitration, has already been decided upon. Before an award may be made, however, some property must be saved, for it is upon the property that the salvors have a lien in law for their claim. Under a marine form of policy, insurers undertake to reimburse the amount of salvage due from the interest insured, subject to a comparison of insured and contributory values as is made in cases of general average. The position is considerably simplified by an agreement that, in practice, salvage under agree-

ment—as distinct from voluntary salvage in the case of an abandoned vessel—shall be treated as general average.

Subrogation.—Subrogation is the principle whereby an insurer who has paid for a loss is entitled to participate in any recovery effected by the assured from a third party in respect of that loss, thus preserving the principle of indemnity which underlies the contract of insurance. Where the insurer pays for a total loss, he is entitled to take over the interest of the assured in whatever may remain of the subject matter so paid for and is thereby subrogated to all the rights and remedies of the assured in and in respect of that subject matter as from the time of the casualty causing the loss. Where the insurer pays for a partial loss, he acquires no title to the subject matter insured, or to such part of it as may remain, but he is thereupon subrogated to all rights and remedies of the assured in and in respect of the subject matter causing the loss, in so far as the assured has been indemnified, according to the Marine Insurance act, by such payment for the loss.

Reinsurance.—Reinsurance is the indemnification of one insurer by another in respect of liabilities that the former has incurred in the course of business. The Marine Insurance act of 1906 gives the reinsured an insurable interest in his risks, but stipulates that, unless the policy provides, the original assured has no right or interest in respect of such reinsurance. Reinsurance may be either facultative, which is the reinsurance of specific individual risks, or by treaty. A treaty of reinsurance is an agreement by one insurer to accept a stated proportion of the whole, or any specified part, of the business accepted by another, it being customary to place limits as to the maximum amount that may be ceded under the treaty. The Finance act of 1959 eliminated the former difficulty applying to the stamping of such treaties, and there appears to be no reason why they should not be duly stamped and enforced in law as valid contracts of marine insurance.

Market Institutions.—In marine insurance, the institutions that exist for the purpose of furthering and protecting the interests of underwriters play a very prominent part. In Great Britain, the oldest of these institutions is the Liverpool Underwriters' association, founded in 1802. The leading body in Great Britain is the Institute of London Underwriters, founded in 1884, and composed of the majority of companies transacting marine business in London, including the London branches of companies in Liverpool and other provincial cities. This body formulates and issues the clauses to which reference has been made. Also, through the medium of the Joint Hull committee, on which Lloyd's underwriters and the Liverpool market are represented, it deals with such matters as the framing of agreements with regard to hull rates and values, the drafting of warranties governing voyages and seasons and similar matters. Lloyd's Underwriters' association is another important market institution to which practically all the active underwriting members of Lloyd's belong, and which works in close collaboration with the Institute of London Underwriters on matters of principle and sometimes on matters of practice. Lloyd's Brokers' association is a body representative of the brokerage side of the business at Lloyd's while the Corporation of Insurance Brokers represents brokers in all parts of Great Britain. The Chartered Insurance institute, largely educational in function, holds examinations in marine insurance. The Association of Average Adjusters, founded in 1872, is a body concerned with the profession of average adjusting (*i.e.*, the adjustment of marine insurance claims), and from time to time it lays down rules of practice for the guidance of members to ensure uniformity in the practice of average adjusting.

Market Institutions in Other Countries.—Elsewhere there are, in most markets, local or national institutions concerned with the regulation and government of business, such as the Central Underwriters' association of Norway, the Association for the Improvement of Marine Insurance in the Netherlands, the Verband, or Union of Underwriters, in Germany and the Union des Syndicats in Paris. These are similar in many respects to the Institute of London Underwriters and are in constant communication with that body and with each other. There is also the International Union of Marine Insurance with headquarters in Berlin, in which the majority of national markets are represented by leading com-

panies. This institution holds an annual conference at which matters of common interest are discussed and it has been the means of producing a number of agreements, the most important of which is that concerning dangerous drugs. By this agreement underwriters are pledged to incorporate in all policies on drugs a clause making it imperative that all claims shall be accompanied by a certificate from the government of the country of origin authorizing the shipment in respect of which the claim is made. This agreement, made in the first place at the instance of the British foreign office, has proved effective in checking the trade in opium, cocaine and other drugs referred to in the various international conventions relating thereto. (C. L. Ro.)

UNITED STATES

Marine insurance in the United States is divided into two classifications, ocean marine and inland marine. Ocean marine insurance is related to the protection of ships and cargoes, whereas inland marine insurance has to do with protection of goods in transit on land and of movable property that is of such a nature that its location is indefinite. The line of demarcation between ocean marine and inland marine is not precise. Small boats, for example, may be insured under either category, depending upon the practices of individual insurance companies.

There are federal and state laws concerning marine insurance, but the business is regulated primarily by the states. Each state has a definition of marine insurance in its statutes, couched in general terms. In most states the general definition is supplemented by the adoption of the nationwide marine definition, a document recommended by the National Association of Insurance Commissioners. This definition is intended to distinguish marine insurance from other kinds of insurance, but it does not distinguish between ocean marine and inland marine.

Ocean marine law and practice relating to the contract, and regarding insurable interest, insurable value, disclosure and representation, measure of indemnity, warranties, double insurance and reinsurance are substantially the same as in Great Britain. There is no federal nor any generally enacted state statute comparable to the British Marine Insurance act of 1906. The result is that some variations in practice in the United States have grown up, largely as a result of court decisions. One difference in practice relates to over-insurance. In the United States if there is double insurance, the policy with the earliest effective date is considered to be the primary insurance. A company whose policy has a later effective date is liable only if the amount of the first policy is insufficient to cover the loss.

Ocean marine insurance in the United States is placed largely in U.S. insurance companies or in U.S. branches of alien companies. Members of Lloyd's of London may participate either by means of direct insurance or by means of reinsuring the policies of insurance companies. Groups or syndicates of insurance companies have been formed in order to provide adequate amounts of insurance and to encourage uniformity in the underwriting of certain types of ships and cargoes. There are also groups that develop uniform policy forms and clauses. Some insurance companies place the underwriting of their ocean marine business in the hands of marine managers who operate for several companies in a group. This is done partly to save expense and also to permit the use of experts.

Rates for ocean marine policies are set by each insurance company or group manager without review or approval by any governmental official. Such rates are specifically exempt from regulation under both federal and state laws. This is considered necessary so that U.S. insurance companies may compete successfully with alien insurers.

Subrogation practices are similar for ocean and inland marine insurance. An insurer having paid a loss to a policyholder acquires the rights of the policyholder to the extent of the payment against any third party who may have caused the loss.

While inland marine is a direct outgrowth of ocean marine insurance in the United States, its practices differ in many respects. These policies primarily cover property in the United States. Property that is insurable under inland marine policies consists

generally of personal property of substantial value that may be carried about by its owners, cargo being shipped by railroad, motor truck or airplane, and equipment of contractors or others who must use the equipment at many different locations. It is also customary to insure fixed property such as bridges and tunnels, and neon signs under inland marine policies, but this has come about because marine underwriters generally are the only insurers who are willing to write the broad insurance coverages desired by the owners of such property.

Rates for many inland marine policies are made by rating bureaus that serve hundreds of insurance companies. Federal and state laws permit insurance companies to act in concert for the making of rates where combined actuarial data are advantageous in determining the probabilities of loss. However, rates are made by the companies individually for those properties where the risks of loss vary greatly between policyholders. (W. H. Ro.)

MARINE RAILWAY: see SLIPWAY.

MARINES are troops specially recruited, trained and organized for service at sea and in land operations incident to naval campaigns. The use of marines goes far back in history. Herodotus and Thucydides refer to *Epibatai*, or "heavy-armed sea soldiers" in the Greek fleets, while Polybius describes *milites classiarii* ("soldiers of the fleet"), a category of Roman soldier organized and specially armed for duty aboard warships, usually the quinqueremes. During the middle ages, ordinary soldiers were frequently embarked aboard ship to provide a fighting backbone, but it was not until the naval wars of the 17th century that the distinct and organized role of marines was almost simultaneously rediscovered by the British and Dutch, who raised the first two modern corps of marines, in 1664 and 1665. The U.S. marine corps, organized in 1775, was originally patterned on the British model. It has retained many of its inherited characteristics but has evolved along independent lines to become the most famous organization of its kind.

U.S. MARINE CORPS

The U.S. marine corps is a military service within the department of the navy. Side by side with the navy, the marine corps comes directly under the secretary of the navy. Its commandant, a four-star general, is responsible to the secretary of the navy for the readiness, administration and performance of the corps as a whole. The commandant also sits as a member of the joint chiefs of staff (g.v.) when matters of concern to the marine corps are under consideration.

The primary missions of the marine corps are to provide fleet marine forces of combined arms, including aviation, for seizure and defense of advanced bases; to conduct land operations incident to naval campaigns; and to develop the doctrines, tactics, techniques and equipment for U.S. landing forces in amphibious operations. In addition, the marine corps is responsible for providing detachments for service aboard certain types of naval vessels as well as security forces for naval shore installations and for United States embassies and consulates. Finally, the corps is required by law to be instantly ready to perform such other duties as the president may direct.

The two fleet marine forces are the expeditionary part of the corps, and are required by law to be maintained at a minimum

strength of three combat divisions, three air wings and supporting units. One fleet marine force is assigned to the Atlantic fleet and the other to the Pacific fleet. To provide and support the marine operating forces, the marine corps supporting establishment includes on each coast of the United States, one recruit depot, one major ground forces base, one supply centre and one or more air stations. Officer training, and all marine development activities, are centralized at marine corps schools, Quantico, Va. Marine corps headquarters is in Washington, D.C. The marine corps reserve, upon which the corps draws to augment its strength in time of large-scale emergency, embraces units and individuals in more than 150 cities. The peacetime strength of the regular marine corps does not usually exceed 200,000.

Marine aviation is primarily trained and equipped to render close air support of ground forces and to conduct expeditionary operations. In addition, it reinforces carrier-based naval aviation. Since marine assault concepts demand the closest air-ground teamwork, marine aviation is integrated in every possible way with ground forces and with the corps as a whole.

Ranks of marine officers are the same as those of the U.S. army, but certain of the noncommissioned officer titles have varied traditionally and are distinctive to the marine corps. (See INSIGNIA, MILITARY.) Young men between the ages of 17 and 28 who are physically and mentally qualified may enlist in the marine corps for three, four or six years. Although the corps has been compelled to accept draftees during certain periods of armed conflict, it is traditionally made up only of volunteers. Every marine recruit undergoes several weeks of rigorous but carefully supervised recruit training at Parris Island, S.C., or San Diego, Calif., followed by a shorter period of advanced training in infantry weapons and small-unit tactics at Camp Lejeune, N.C., or Camp Pendleton, Calif. The corps obtains officers from a wide variety of sources, including the naval academy, military academy, civilian colleges, the marine aviation cadet program and meritorious non-commissioned officers. With few exceptions, newly commissioned marine officers, regardless of source or previous training, are sent through the marine corps basic school at Quantico.

The marine corps includes women marines, both regular and reserve. In peacetime approximately 2,000 women—2% of the authorized strength of the corps—serve as U.S. marines at posts in continental United States and Hawaii, as well as overseas. Women marines perform such duties as personnel administration, communications, aerology, food services, photography and disbursing. The director of women marines, a colonel, supervises the women marines and is on the commandant's staff at marine corps headquarters.

Single young women of good character who are physically and mentally qualified and between the ages of 18 and 30 are eligible for the marine corps. Women recruits undergo ten weeks' training at Parris Island, while women officer candidates (who must be college graduates or equivalent) train for 18 weeks at Quantico. Although the women marines were not authorized as a permanent regular component of the corps until 1948, they were first enlisted for war service in World War I as Marinettes, and in World War II as women reservists.

History and Traditions.—On Nov. 10, 1775, the date usually given for the origin of the U.S. marine corps, the Continental Congress ordered that two battalions of marines be raised for service as landing forces with the fleet. For an infant maritime power this was a natural requirement and it has continued to exist. In addition to projecting naval power ashore, however, it has also been a recognized function of the marine corps to provide mobile, immediately ready, professional military units to serve as national forces-in-readiness. The first commandant of the corps was Capt. Samuel Nicholas of Philadelphia.

Marines have participated in all wars of the United States, being in most instances first, or among the first, to fight. In addition, marines have executed more than 300 landings on foreign shores and served in every major U.S. naval action since 1775.

The marines' first battle was the expedition against Nassau, in the Bahamas, in 1776. After the American Revolution, the Continental marines, together with the navy, were inactivated; on

July 11, 1798, congress re-established the marines as a separate corps. During the following century marines fought in the naval war with France (1798–1801), Tripolitan War (1801–05), War of 1812, Creek and Seminole wars (1836–42), Mexican War (1846–48) and the American Civil War (1861–65). During the Civil War, marines fought at Bull Run, on the Mississippi river and in all amphibious landings of the U.S. navy along the Confederate coast. The Confederacy organized its own marine corps on March 16, 1861; this was a smaller but virtually identical copy of the U.S. marines, and the Confederate marines—largely officered by former U.S. marine officers of southern birth—performed similar duties throughout the war.

Between wars in the 19th century, marines landed in the South seas, China, Japan, Korea, Panama, Uruguay, Paraguay, Egypt, Mexico, Cuba, the arctic, Formosa, Argentina, Chile, Greenland, Haiti, Nicaragua and the Samoa Islands.

Following the Spanish-American War (1898) the corps entered an era of professional development and expansion. It saw active service in the Philippine insurrection (1899–1902), Boxer uprising (1900), Cuba (1906–09), Nicaragua (1912), Veracruz (1914), Haiti (1915–34) and the Dominican Republic (1916–24). After the United States entered World War I, the 4th marine brigade in France fought at Belleau wood, Soissons, St. Mihiel, Blanc Mont and the Meuse-Argonne.

In 1921, foreseeing the eventuality of a naval war in the Pacific, the marine corps began its development of modern amphibious warfare. For the next two decades, with a strength that never exceeded 18,000, it worked closely with the navy to evolve the amphibious assault doctrines ultimately used by the United States in World War II. These doctrines were proven by marines on Guadalcanal (first American offensive in World War II), Bougainville, Tarawa, Roi-Namur, Eniwetok, New Britain, Saipan, Tinian, Guam, Peleliu, Iwo Jima, and Okinawa. By 1945 the marine corps included six divisions, four air wings and supporting troops. Its top strength in World War II was 485,113, of whom more than 90% served overseas in combat.

Immediately after the war, the marine corps became convinced that the challenge of modern weapons, especially the atom bomb required a far more flexible, widely dispersed and rapid landing attack than had been possible in the past. Between 1946 and 1950, the marine corps therefore developed an amphibious "vertical envelopment" concept using assault helicopters—pioneered by the corps—as landing craft, and aircraft carriers as transports. This was subsequently adopted, like the earlier marine concepts of the 1920s and 1930s, as standard U.S. navy and marine doctrine.

After outbreak of war in Korea (1950), marines were the first reinforcements dispatched from the U.S. to the aid of the U.S. forces retreating on Pusan. Subsequently marines executed the Inchon landing and carried out the epic winter withdrawal from the Changjin reservoir to the sea. From 1951 to 1953, marine ground and aviation units played a major part in the hard-fought but indecisive battles along the 38th parallel. (See KOREAN WAR.)

Beginning in 1965, marine air and ground units were involved in the fighting in Vietnam.

The marine corps emblem is the western hemisphere superimposed on a fouled anchor and surmounted by a spread eagle. The corps motto is *Semper Fidelis* ("Always Faithful"), which is also the title of the corps march, composed by John Philip Sousa when he was leader of the U.S. marine band. Perhaps even more familiar is "The Marines' Hymn" beginning with the words, "From the Halls of Montezuma to the shores of Tripoli . . ." The marine band, the oldest musical organization in the U.S. armed forces, is known as "The President's Own" because of its privilege of performing at all state functions at the White House. The official colours of the corps are scarlet and gold, but forest green enjoys semiofficial recognition. The distinctive dress blue uniform of marines, with its standing collar, is well known, whereas the forest green service uniform bespeaks the original status of the corps as light infantry. From the standing collar—descended from the tall leather neckpiece of the 18th- and 19th-century uniform—comes the traditional nickname for marines of "leathernecks"; the equivalent slang term for British marines, from the same origin, is

"boot-necks." In naval formations, marines have the privilege of forming on the right of line or at the head of column, the traditional places of honour and seniority.

ROYAL MARINES (GREAT BRITAIN)

The Royal Marines were founded by an order in council on Oct. 26, 1664, as the duke of York and Albany's maritime regiment of foot—1,200 "land Souldgers prepared for sea service," administered by the admiralty. The modern Royal Marines remain under the admiralty, and the commandant general, Royal Marines, a lieutenant general, reports to the board of admiralty. His headquarters, the Royal Marine office, is in London. A member of the royal family serves as captain general of the corps.

The missions of the Royal Marines are to: (1) supply detachments for her majesty's ships; (2) provide bands for the navy; (3) man minor landing craft; (4) provide commando (amphibious raiding) units; (5) serve as a link between the navy and the army during landing operations. Since World War II, the peacetime strength of the Royal Marines has approximated 10,000.

The marine establishment in the U.K. is divided into the Portsmouth and Plymouth groups, each under a major general. Portsmouth group, with headquarters at Royal Marine barracks, Eastney, directs the seagoing training of the corps, as well as the amphibious school at Poole, Dorset, which operates in conjunction with the Joint Services School of Amphibious Warfare at the same place. Plymouth group, with headquarters at Stonehouse barracks, Plymouth, co-ordinates the military training of Royal Marines. Plymouth group's two most important subordinate activities are the commando school, Bickleigh, Devon, and the infantry training centre, Lymington, Devon. The latter also includes the Officers' School Royal Marines, where subalterns receive basic instruction. Recruits are trained at Deal, Kent. While women serve with the Royal Marines, they are assigned from the Women's Royal Naval service (WRENS).

Aside from ships' detachments, the commando brigade—Britain's permanent commando force—is the principal operating unit of the corps. After World War II, when marines assumed the commando role, the brigade served in Hong Kong, Palestine, Malaya and Cyprus. At Suez (1956) the brigade formed the amphibious spearhead; one unit conducted its assault on Port Said by helicopters landed from an aircraft carrier in accordance with the U.S. marine vertical envelopment concept.

History and Traditions.—From 1664 until 1755 the various marine regiments went through reorganizations, disbandments and fluctuations between army and admiralty control. The most distinguished episode of the period was the capture and subsequent defense of Gibraltar by marines in 1704–05, for which the corps still bears on its colours the single battle honour, *Gibraltar*. In 1755 the corps of marines was reorganized into 50 independent companies under complete admiralty control, and grouped into three "divisions" at Portsmouth, Plymouth and Chatham, an organization which, with slight changes, lasted until 1947.

Marines served in the Seven Years' War (1756–63), American Revolution (1775–81) and Napoleonic Wars (1792–1815), winning the designation "royal" in 1802. Three years later a fourth division was established at Woolwich, and an artillery company was added to each existing division. In 1855, the infantry companies were designated "Royal Marines, light infantry," and, in 1862, the artillery companies were grouped as "Royal Marine artillery." This separation continued until 1923, when the corps was reconstituted as the Royal Marines.

In World War I marines saw service widely at sea and as infantry and artillery. The most notable action of the corps was its raid on Zeebrugge in 1918. In World War II, the corps initially organized one marine division and two mobile naval base defense organizations, and attained a top strength of 78,000. A reorganization in 1944 converted most of the Royal Marines into commandos and landing craft detachments. Outstanding among many feats of the corps in the war were the defense of Crete (1941) and assault on Walcheren (1945). One commando was sent to Korea in 1950 and served with the U.S. 1st marine division throughout the Changjin reservoir campaign.

The Royal Marines' badge is the globe (conferred in 1827 by King George IV), surrounded by a laurel wreath won in 1761 for the storming of Belle Isle, surmounted by the lion and crown of a royal regiment, and an anchor. *Per Mare, Per Terram* ("By Sea and by Land") is the corps motto, and the corps colours are yellow, scarlet, green and blue. The uniforms of Royal Marines are not unlike those of the U.S. marine corps.

OTHER MARINES

In addition to the United States and Great Britain, 19 other nations maintain marines or units which perform similar duties. Oldest of these is the Royal Netherlands *korps mariniers*, established on Dec. 10, 1665, as part of the Netherlands navy. The *korps mariniers* saw immediate action against England, France and Spain, and played a conspicuous part in the Dutch amphibious raid up the Medway (1667). Subsequently the corps was mainly employed to police and protect the Dutch empire. During World War II it was reorganized and trained by the U.S. marine corps. The motto of the corps is *Qua Patet Orbis* ("To the Ends of the World").

Other countries having marines or some type of "naval infantry" are: Argentina, Brazil, Cambodia, Chile, Colombia, France, Indonesia, Iran, Mexico, Nationalist China, Philippine Republic, Republic of Korea, Spain, Thailand, U.S.S.R., Venezuela, Vietnam and Yugoslavia.

MARINETTI, FILIPPO TOMMASO (1876–1944), Italian writer, the founder of the literary Futurist movement, was born at Alexandria, Egy., Dec. 22, 1876, and educated in Paris. He published the original Futurist manifesto in the Paris *Figaro* on Feb. 20, 1909. His most characteristic work was the *Manifesto del futurismo* (1910). In 1914 he wrote the extraordinary *Zang-tumb-tuum* on the Balkan War. His *Guerra sola igiene del mondo* (1915) advocated Italian intervention in World War I. In *Puturismo e fascismo* (1924) he expressed support of Fascism, under which he enjoyed official backing.

Marinetti described himself as a "mystic of action"; but his technical devices (e.g., "words in their freedom") and noisy agitations were essentially sterile. His war against all forms and patterns of ideas of the past, though expressive of a revolution against literary tradition, created a rhetoric of its own. His Futurism also numbered Italian painters among its followers, with some success. Marinetti died at Bellagio, Dec. 2, 1944. (U. L.)

MARINI, MARINO (1901–), Italian sculptor, was born in Pistoia, Feb. 27, 1901, and was academically trained in Florence. From 1929 to 1940 he taught art in Monza and after 1940 in Milan; from 1942 to 1946 he lived in Switzerland. Marini's talent lay in seizing upon strong gestures that convey great strain or distress, as in the horse and rider series beginning in the 1930s, or taking a passively posed body and imparting to its surface great richness of colour and texture. He was deeply aware of older and primitive art, and his taste was for strongly shaped sensuous masses, which in his sculptures of women were given a graceful lightness. Marini's humanism expressed itself in his striking portrait of Igor Stravinsky (1950), and his series dealing with the peasant on his horse, menaced by war. While searching for elementary forms, Marini wanted his surfaces to reveal the spiritual substratum of his subjects. He worked with few themes, refining and re-exploring, so that often the differences between his sculptures are extremely subtle. Marini also worked in other media.

See Carola Giedion-Welcker, *Contemporary Sculpture*, 3rd ed. (1960). (A. E. EL.)

MARINIDS (BANU MARIN), a Berber dynasty which established its rule over Morocco, and temporarily over other parts of northern Africa, during the 13th–15th centuries A.D. A tribe of

the Zenata group, they had been established in eastern Morocco for over a century when in 1248 their ruler Abu Yahya captured Fès (Fez) and made it the Marinid capital. The defeat of the last of the Almohads (*q.v.*) and the capture of Marrakech in 1269 made the Marinids under their ruler Abu Yusuf Yakub masters of Morocco. They would have been wise to have eschewed foreign adventure and to have concentrated on consolidating their power in Morocco, for the Marinids could not draw on the same strength as either of their predecessors, the Almohads or the Almoravids, nor were they the leaders of any religious cause. Being ambitious, however, to fulfill the duties of Muslim sovereignty and to acquire religious prestige, they were often at war with the Christian kings of Castile in south Andalusia. They could not attempt the reconquest of former Muslim Spain but gave valuable assistance to the Nasrid kingdom of Granada and up to the mid-14th century slowed down the advance of the Christians to the Strait of Gibraltar.

In Africa the Marinids tried to re-establish the Almohad empire and, driving to the east, attacked their kinsmen the Abd-al-Wadids of Tlemcen. The greatest of the Marinid sultans, Abu'l Hasan, captured Tlemcen in 1337 and then seized much of Tunisia. He was defeated however at Kairouan in 1348 and driven from the country. His successor Abu Inan met with a similar fate: after capturing Tunis in 1357 he was compelled to flee the country. These adventures absorbed the resources of the dynasty and diverted their attention from the grave problems which they had to solve in Morocco. The Bedouin Arab tribes which had settled there had ruined the ancient economy of the country by their depredations and by the development of nomadism. In the 15th century much of the country was in a state of rebellion. Further, the Marinids had not succeeded, in spite of the foundation of religious schools, in controlling the religious evolution of the country.

Sufism, which spread everywhere, degenerated into maraboutism and in the 15th century anarchy ensued in which the Marinid dynasty foundered. The towns of the Maghreb, especially Fès and Tlemcen, owe to the Marinids some splendid monuments which, though often of small dimensions, display a refined luxury.

See H. Terrasse, *Histoire du Maroc*, vol. II (1950). (H. L. E. T.)

MARINKOVIĆ, VOJISLAV (1876–1935), Yugoslav statesman, foreign minister in 1924 and from 1927 to 1932 and prime minister for three months in 1932, was born in Belgrade on May 13 (new style; May 1, old style), 1876. Having graduated as doctor of laws in Paris (1901), he entered parliament as a Progressist (1906), represented Serbia at the Paris conference (1913) for the financial settlement of the Balkan Wars and became minister of national economy (1914–17). The leader of the Serbian Progressist party from 1915, he took part in the drafting of the Corfu declaration of 1917 and the Geneva agreement of 1918 and became the first Yugoslav minister of trade. He brought the Progressists into the new Democratic party in 1919. As minister of the interior (1921–22) he organized the electoral law. He served twice as minister of foreign affairs (1924, 1927–32) and was prime minister from April 4 to July 29, 1932. He died in Belgrade on Sept. 18, 1935.

During his five years as foreign minister Marinković signed a treaty of friendship with France (1927), ratified the Nettuno conventions concluded with Italy (1928), represented Yugoslavia at the assemblies of the League of Nations and was a member of the League council (1929–32; he was president of the council in 1930). He took part in the negotiations for the agreement establishing the Balkan entente and for the new statute of the Little entente, but both were signed after his resignation. (See YUGOSLAVIA: History.)

An eloquent speaker, well-known at Geneva for his courage in saying what many thought but kept unsaid, Marinković's most important part was played in 1931 when Germany and Austria attempted to conclude an *Anschluss*: it was mainly because of his energetic stand that the Austrians had to disavow their signature. At home he favoured coalition governments. A great and imaginative parliamentarian, he was respected by members of all parties.

See K. S. Pavlović, *Vojislav Marinković* . . . , 5 vol. (1955–60). (K. St. P.)

MARINO (MARINI), **GIAMBATTISTA** (1569–1625), Italian poet, the foremost of the *secentisti* (see ITALIAN LITERATURE), was born at Naples on Oct. 18, 1569. After a riotous youth, he secured the powerful patronage of Cardinal Piero Aldobrandini, whom he accompanied from Rome to Ravenna and to Turin. His early poems, *Le rime*, were published in 1602, and under the title *La lira*, in 1608 and 1614. At Turin (1608–15) he enjoyed the duke of Savoy's protection, but Marino eventually had to leave Italy because of resentment at his satirical writing and at his disorderly life. He then took refuge in Paris (1615–23) where he was favourably recognized by Marie de Médicis and by Louis XIII. Marino died at Naples on March 25, 1625.

Marino's *Adone* (1623; new ed. by R. Balsamo-Crivelli, 1922) tells the story of Venus and Adonis, with many digressions, in 45,000 lines. The poem contains many passages that still impress by their brilliance and shows a consummate mastery of technique; but it remains episodic, failing to come to life as a whole.

Marino's avowed purpose as a stylist was novelty at all costs, in order to dazzle the reader; and his licence, extravagances and conceits impressed his contemporaries and led many to imitate him. "Marinism" was the Italian manifestation of that cult of artifice and ornament which characterized western European literature in the 17th century.

Other publications by Marino include *La strage degli Innocenti* (1632; Eng. trans., by R. T., *The Slaughter of the Innocents*, 1675); *Lettere* (1627; critical ed. by A. Borzelli and F. Nicolini, *Epistolario*; 1912). Selections of his works were published in *Poesie varie*, ed. by B. Croce (1913), *Le più belle pagine di Giambattista Marino*, ed. by R. Balsamo Crivelli (1925) and *Prose e poesie*, ed. by C. Culcasi (1930).

See G. F. Damiani, *Sopra la poesia del cavalier Marino* (1899); C. Culcasi, *G. B. Marino* (1932). (U. L.)

MARINUS, the name of two popes, sometimes erroneously called Martin (*q.v.*).

MARINUS I (d. 884), pope from 882 to 884, a Tuscan, succeeded John VIII in Dec. 882. He had been deacon and treasurer of the Roman church and bishop of Caere and had been sent on missions to Constantinople by Nicholas I. Adrian II and John VIII. Marinus carried on the discussions with Photius begun under Nicholas. Owing to the researches of F. Dvornik it is now widely doubted that Marinus ever condemned Photius. Marinus died on May 15, 884.

MARINUS II (d. 946), pope from 942 to 946, a worthy man of whom little is known except that he was ruled by Alberic, prince and senator of the Romans. He died in April or May 946. (C. P. L.)

MARINUS, Neoplatonist philosopher, came from Neopolim (Shechem) in Samaria and was a convert from Samaritan Judaism to the old Greek religion. He succeeded Proclus as head of the Neoplatonic school at Athens in A.D. 485. His thought, like that of his predecessor and teacher, was a mixture of sober scholarship and acute reasoning (he was keenly interested in mathematics) and fantastic superstition. Marinus' chief surviving work is a biography of Proclus, ed. by J. F. Boissonade (1814), Eng. trans. in L. J. Rosan, *The Philosophy of Proclus* (1949). (A. H. Ag.)

MARIO, stage name of GIOVANNI MATTEO DE CANDIA (1810–1883), one of the famous Italian tenors of the 19th century, was born of a noble family at Cagliari on Oct. 17, 1810. While serving as an officer in the Sardinian army he fled to Paris to avoid arrest for his connection with Giuseppe Mazzini and the Young Italy party. There, on the advice of Meyerbeer, he studied singing under L. A. Ponchard and G. M. Bordogni and made his debut in 1838 at the Opéra in Meyerbeer's *Robert le Diable*. In 1839 he sang with Giulia Grisi at Her Majesty's theatre in London and later in the year they sang at the Théâtre Italien in Paris. In 1843 he created the part of Ernesto in *Don Pasquale*. Married to Giulia Grisi in 1839, he soon won a European reputation and sang regularly in Paris and at Covent Garden, where in 1847 he took part in that theatre's first season of Italian opera. He is said to have had a voice of unrivalled softness and richness and he was

also considered a fine actor. He died in Rome in reduced circumstances on Dec. 11, 1883.

MARION, FRANCIS (1732–1795), American soldier in the Revolutionary War, nicknamed “the Swamp Fox” by the British because of his elusive tactics, was born in 1732 at Winyah, Berkeley county, S.C. His first military experience was against the Cherokee Indians in 1759. For the next 14 years he was a hunter and farmer in South Carolina. After serving as a member of the South Carolina provincial congress in 1775, Marion was commissioned a captain, and he recruited patriots to fight the British. Promoted to the rank of major in 1776, he took part in defending Charleston harbour and in nine months had become a lieutenant colonel. After the surrender of Gen. Benjamin Lincoln to the British at Charleston in 1780, Marion slipped away to the swamps. He was ordered to burn boats and generally harass the enemy. In 1781 he was appointed a brigadier general by Gov. John Rutledge, and after the disastrous defeat of Gen. Horatio Gates at Camden, Marion gathered around himself a band of intrepid guerrillas whom he trained to ride and fight hard while living off the land. Though Marion could not swim, he was at home in the watery swamps and often defeated larger bodies of British troops by surprise and rapidity of movement. Even the dreaded Col. Banastre Tarleton could not find Marion, saying, “As for this damned old fox, the devil himself could not catch him.” But he did appear and united his men with those of Gen. Nathanael Greene in engagements at Georgetown and Eutaw Springs. For a daring rescue of Americans surrounded by a British force at Parker’s Ferry, Marion received the thanks of congress. After the war he served in the senate of South Carolina from 1782 to 1790 and died on his estate in Berkeley county on Feb. 27, 1795.

See R. D. Bass, *Swamp Fox* (1959); J. R. Alden, *The South in the Revolution* (1957). (No. C.)

MARION, city and seat of Grant county, Ind., U.S., is located 65 mi. N.E. of Indianapolis on the Mississinewa river.

In the 1880s and 1890s it experienced booms in gas and oil, supplies of which failed after the turn of the century. Its industry, rapidly expanding by mid-20th century, is diversified but tends toward automotive parts domination. Other products include plastics, glassware, castings, television tubes, paper products, wire and cable, electrical parts and dairy products. Corn, oats and pigs are important in the local economy. Wheat and beef and dairy cattle are also produced and the county ranks high in soybean and tomato production.

A veterans administration hospital cares for about 1,650 psychiatric patients in more than 60 buildings. Taylor university (1846) is at nearby Upland. Matter park includes a zoo and historical museum. U.S. troops fought Miami Indians nearby at the battle of Mississinewa in 1812. The community was founded in 1831 as the county seat, chartered in 1889, and named for Gen. Francis Marion (q.v.). For comparative population figures see table in *INDIANA: Population*. (R. S. St.)

MARION, a city of Ohio, U.S., and seat of Marion county, is located 44 mi. N. of Columbus in the midst of fertile farming and grazing lands. Laid out in 1821 (or 1820) on a natural travel route between Columbus and Lake Erie, the site first was called Jacob’s Well after Jacob Foos, who had dug for water just south of the original plat (now within the city limits). The settlement was officially named for Gen. Francis Marion (q.v.) of Revolutionary War fame, in 1822; it was incorporated as a village in 1830 and became a city in 1890.

The city’s location and transportation facilities contributed to its prosperity, and its pre-eminence in the manufacture of excavating machinery earned for it the sobriquet “Shovel City.” Other major industries include road-construction machinery, home laundry dryers, metal products, refrigeration equipment, racing sailies, brass bushings, burial vaults and overhead garage doors. At Marion are the Harding house and museum and the Harding memorial, honouring the nation’s 29th president, Warren G. Harding (q.v.). The city is also the location of a U.S. army engineer storage depot. For comparative population figures see table in *OHIO: Population*. (J. S. St.)

MARIONETTES: see PUPPETRY.

MARIOTTE, EDME (c. 1620–1684), French physicist, co-discoverer of Boyle’s law (q.v.), which is known by Mariotte’s name in France, spent most of his life at Dijon, where he was prior of St. Martin-sous-Beaune. He was one of the first members of the Academy of Sciences founded at Paris in 1666. He died at Paris on May 12, 1684. The first volume of the *Histoire et mémoires de l’Académie* (1733) contains many original papers by him upon a great variety of physical subjects, such as the motion of fluids, the nature of colour, the notes of the trumpet, the barometer, the fall of bodies, the recoil of guns, and the freezing of water. His *Essais de physique*, four in number, of which the first three were published at Paris between 1676 and 1679, are his most important works, and form, together with a *Traité de la percussion des corps*, the first volume of the *Oeuvres de Mariotte* (2 vol., 1717). The second of these essays (*De la nature de l’air*) contains a statement of Boyle’s law, which Mariotte discovered independently.

MARIPOSA LILY, tuliplike perennial plants of the genus *Calochortus*, of the lily family (Liliaceae), comprising about 40 species native to western North America, about 25 of which are found in California. They have simple or somewhat branched

AL. MORTON

SEGIO LILY (*CALOCHORTUS NUTTALLII*). A SPECIES OF MARIPOSA

stems, one-half foot to four feet tall, rising from coated corms and bearing a few narrow leaves and showy white, yellow, lilac, or bluish flowers, often spotted or marked in the centre. The three large broad petals, one to two inches long, usually bear a conspicuous basal gland. Several species are in cultivation, among them the sego lily (*Calochortus nuttallii*), native to dry soil from South Dakota to Washington and south to Oregon and California. Its large white flowers are variously marked with yellow, purple, and lilac. Like manna in the

wilderness the edible roots of the sego lily are said to have been used for food by the early Mormon settlers in the Salt Lake Valley. The plant has since been identified with the symbolism of the Mormon Church in Utah, of which state it was formally adopted as the floral emblem or state flower.

MARIS, JACOB (1837–1899), Dutch landscape painter, the eldest of three brothers all of whom became artists, was born at The Hague on Aug. 25, 1837. He first studied at the Antwerp Academy, and subsequently in Antoine Hébert’s studio in Paris from 1865 till 1871. He is best known for his scenes from the Netherlands countryside, of bridges and windmills, old quays, massive towers, and level banks, against misty skies or chasing clouds. In all his works, whether in water or oil colour, and in his etchings, the subject is always subordinate to the atmospheric effect, as in the “Grey Tower, Old Amsterdam,” “Landscape Near Dordrecht,” “Sea-weed Carts, Scheveningen,” “A Village Scene,” and numerous other pictures. He died at Karlsbad (Karlovy Vary, Czech.) on Aug. 7, 1899.

MATTHEW (MATTHIJS) MARIS (1839–1917), younger brother of Jacob, was born at The Hague on Aug. 17, 1839. He received a royal subsidy and for some time lived and worked with his brother Jacob, on whom his more spiritual and mystical nature had a refining influence. There is a touch of medievalism in many of his figures. “Souvenir of Amsterdam,” “Bride of the Church,” “The Four Mills,” and “Girl Feeding Chickens” are among his most successful works. In 1885 he went to London to design windows. He died in London on Aug. 17, 1917.

WILLIAM (WILLEM) MARIS (1844–1910), youngest of the brothers, was born at The Hague, Feb. 18, 1844. He developed under the influence of Jacob and Matthew and lived for the greater part of his life in London. His paintings of cattle grazing, the most famous of which is “Cows Beside a Ditch,” are modern in treatment and have charm of colour and feeling. He died in London in 1910.

MARISCO (MARSH), **ADAM DE** (d. c. 1258), English Franciscan and theologian, known as *Doctor illustris*, was born in the last years of the 12th century, probably in Somerset, and educated at Oxford, where he was important in the early organization of the university. His uncle, Richard Marsh, bishop of Durham, gave him the benefice of Wearmouth, but the young priest soon joined the Franciscans, who had recently come to England. Adam Marsh first pursued his studies, especially of theology and mathematics, at Oxford (from a date between 1226 and 1230), under Robert Grosseteste, and was the first Franciscan lecturer at the university (c. 1238). A devoted friend of Grosseteste, he became the spiritual director of Simon de Montfort as well as a counselor of King Henry III and his queen, and of Archbishop Boniface of Canterbury. Thus enabled to guide the policy both of the opposition and of the court party in matters affecting the interests of the church, he was inclined to avoid official charges in his own order and elsewhere and contented himself with exercising an important influence unhampered by administrative duties. As chancellor of Lincoln, he accompanied his bishop, Grosseteste, to the Council of Lyons in 1245 and refused an invitation to take the chair in the University of Paris lately occupied by Alexander of Hales and John of La Rochelle. Both Henry III and Archbishop Boniface were anxious to secure for him the see of Ely in 1256, but the opposition of the monks defeated their intention, and he died shortly afterward.

BIBLIOGRAPHY.—For his correspondence see J. S. Brewer (ed.), *Monumenta Franciscana*, vol. 1 (1858). See also A. G. Little, *Grey Friars in Oxford* (1892), "The Franciscan School at Oxford," *Archivum Franciscanum Historicum*, vol. xix (1926). (Pl. Gn.)

MARIST BROTHERS (LITTLE BROTHERS OF MARY; INSTITUTUM FRATRUM MARISTARUM A SCHOLIS; F.M.S. or P.F.M.), a Roman Catholic congregation of teaching brothers founded in 1817 by Marcellin Champagnat (1789–1840), who was beatified in 1955. The congregation was approved Jan. 9, 1863, and it has grown to be one of the largest orders of men. The brothers, scattered all over the world, are devoted entirely to the education of youth. The general mother house is at St. Génis Laval, France. See also **ORDERS AND CONGREGATIONS, RELIGIOUS**.

MARIST FATHERS (SOCIETY OF MARY; SOCIETAS MARIAE; S.M.), a Roman Catholic religious congregation founded in 1822 in the diocese of Belley, France, by Jean Claude Colin to undertake all ministerial works, parochial educational and missionary, while stressing the virtues of the Virgin Mary. The congregation has establishments in 20 countries; members number about 2,300. Its foreign missions, the acceptance of which was the chief reason for its approval by the Holy See (April 29, 1836), embrace the islands of the South Pacific (the congregation's original mission field), Japan, Algeria, Peru and Venezuela. Stemming from the Marist Fathers are the Marist Brothers, the Marist Sisters, the Missionary Sisters of the Society of Mary and the Blessed Sacrament Fathers. (Jo. L. W.)

MARITAIN, JACQUES (1882–), French philosopher internationally respected both as an interpreter of the thought of St. Thomas Aquinas and as a profound and far-reaching thinker in his own right, was born in Paris on Nov. 18, 1882. Brought up in an atmosphere of liberal Protestantism, he went to the Sorbonne and fell briefly under the spell of teachers who held that the natural sciences alone could provide all the answers to the questions tormenting the human mind. At the Sorbonne also, however, he met Raïssa Oumansoff, a Russian Jewish student who was to share his quest for truth. Soon disillusioned with the scientism of the Sorbonne, the two began to attend the lectures of Henri Bergson (q.v.), who liberated in them "the sense of the absolute." They were married in Nov. 1904 and were received into the Roman Catholic Church on June 11, 1906.

Having graduated in philosophy (1905), Maritain spent two years at Heidelberg studying biology (1906–08). He then returned to Paris and took up the study of Thomism. In 1913 he began teaching at the Institut Catholique, where he was professor of modern philosophy from 1914 to 1939. From 1932, moreover, he gave yearly courses at the Institute of Mediaeval Studies, Toronto. Sent to the United States by the French government

in 1939, he was visiting professor at Princeton (1941–42) and at Columbia (1941–44). After World War II he was French ambassador to the Holy See (1945–48) and then professor of philosophy at Princeton (1948–55).

Maritain's thought is based on the principles of Aristotle and St. Thomas Aquinas, but incorporates many insights found in other philosophers, both classical and modern, and also profits from data supplied by such sciences as anthropology, sociology and psychology. Dominant themes are: (1) that there are different ways of knowing reality—science, philosophy, poetry, mysticism, etc.—each with its own proper legitimacy and prerogatives; (2) the transcendence of the human person with respect to the political community; (3) knowledge of natural law by inclination; (4) the need for moral philosophy to take into account the data of revelation and theology as to the existential state of man; and (5) the pluralistic co-operation among men of different beliefs in the pursuit of the common good of political life. A Jacques Maritain centre was established at the University of Notre Dame, Notre Dame, Ind., in 1958.

Among Maritain's most important works are *Art et scolastique* (1920; 2nd Eng. trans., *Art and Scholasticism*, 1930); *Distinguer pour unir, ou les degrés du savoir* (1932; Eng. trans., *The Degrees of Knowledge*, 1937; new trans. 1959); *Frontières de la poésie* . . . (1935; partial Eng. trans., *Art and Poetry*, 1943); *Humanisme intégral* (1936; Eng. trans., *True Humanism*, 1938); *Sept leçons sur l'être* . . . (1934; Eng. trans., *A Preface to Metaphysics*, 1939); *Man and the State* (1951); *Creative Intuition in Art and Poetry* (1953); and *La Philosophie morale: examen historique et critique des grands systèmes* (1960; Eng. trans., *Moral Philosophy: an Historical and Critical Survey of the Great Systems*, 1964).

(J. W. Ev.)

MARITIME ADMINISTRATION, U.S., an agency of the federal government established in May 1950, along with the federal maritime board, to replace the United States maritime commission. The Maritime administration was made a part of the department of commerce. Both the board and the administration were established to foster the growth of a U.S. merchant marine sufficient to meet the needs of national defense and of foreign and domestic commerce. The guiding principles for their operation remained those set forth in the Merchant Marine act of 1936.

The Maritime administration is responsible for administering shipbuilding, shipping, port development and related programs authorized by law. It determines the ocean services, routes and lines needed for the nation's foreign and domestic commerce, and the types of ships required to provide adequate service. It recommends the terms of subsidy contracts to be awarded by the federal maritime board to U.S. shipping companies and shipyards. The Maritime administration provides insurance on private loans and mortgages for ship construction, arranges for war risk insurance and pays the cost of national defense features added to ships. It conducts a research and development program to improve the efficiency and economy of operations of the U.S. merchant marine, including study of nuclear-powered ships. It maintains a national defense reserve fleet of government-owned ships, maintains several shipyards in inactive condition for use in a national emergency, and operates warehouses for the storage of marine equipment that might be required in an emergency. It also operates radar training schools and the U.S. Merchant Marine academy at Kings Point, N.Y.

The federal maritime board is composed of three members appointed by the president by and with the advice and consent of the senate. One of the three members is designated as chairman of the board and also serves as head of the Maritime administration. The board is a regulatory agency and as such is independent of the secretary of commerce.

Its functions include the regulation of rates, services, practices and agreements of common carriers by water. It may enter into subsidy contracts relating to construction and operating costs to help U.S. shipyards and shipping companies meet the competition of foreign countries. It makes its determinations with regard to such contracts in accord with the provisions of the Merchant Marine act of 1936.

The history of efforts by the federal government to develop and maintain a strong merchant marine and to regulate water carriers in foreign and interstate commerce goes back many years. In 1916 the U.S. shipping board was established with these goals in mind. It played an important role in World War I but during the postwar years the U.S. merchant fleet was in a far from healthy state. The Shipping board was abolished in 1933 and in 1936 new legislation created the U.S. maritime commission. The 1936 act authorized new types of subsidies to help U.S. shipping firms meet competition from low-wage countries which also offered subsidies to their merchant marines. (M. S. BL.)

MARITIME LAW, or admiralty law, is the body of legal rules, partly substantive, partly procedural, which has grown up around the shipping industry. As transportation of goods and passengers by water is one of the earliest forms of commercial activity of which there is record, references to the law of the sea abound in the sources which have come down from antiquity and, after the revival of a commercial society in Europe, from the middle ages. It is easy to exaggerate both the completeness of the ancient and medieval sea codes and their relevance to modern law. The 6th-century Byzantine compilation known as the *Digest* of Justinian includes a mass of references which are often confused and contradictory, obscure in meaning and of uncertain date, authority and integrity. The largely mythical body of law attributed to the Rhodian mariners has been constructed from a few scattered references in the *Digest*. A number of medieval collections of local maritime customs have survived, the earliest extant editions or copies going back to the 13th and 14th centuries; the best known of these are the *Consolat de Mar* or "Consulate of the Sea" (Barcelona, 1494), the Laws of Oléron and the Laws of Visby (or Wisby), which are of uncertain date. Many of these medieval sea codes, so-called, were reproduced in the influential 17th-century French treatise by Étienne Cleirac, *Les Us et Coutumes de la mer* (1647). The great 19th-century collections were made by Jean Marie Pardessus, *Collection des lois maritimes antérieures au XVIII^e siècle* (6 vol., 1828-45), and by Sir Travers Twiss in his edition of the *Black Book of the Admiralty* (4 vol., 1871-76).

Development of English Admiralty Jurisdiction.—The material just mentioned is of great historical interest but is no longer relevant to a discussion of modern maritime law, since each major change in the technology underlying the shipping industry has resulted in a major change in the inarticulate bases of the law. Furthermore, England, the United States and other countries whose legal systems derive from that of England were affected by the peculiar development of the English court system.

By the end of the 16th century the English admiralty courts, of which the most important was the high court of admiralty (founded in 1360), had come to exercise an extremely wide jurisdiction, reaching far beyond salt-water transportation into many areas of commercial law. But during the first half of the 17th century the judges of the common-law courts succeeded in divesting their competitors in the admiralty of their commercial jurisdiction and in restricting them to the adjudication of "things done upon the sea." This restriction of jurisdiction was accomplished through writs of prohibition issued by the common-law courts under the vague authority of a series of long-ignored statutes, the earliest of which was dated in the reign of Richard II (13 Rich. II, c. 5 [1389]). The common-law courts do not seem to have had, or to have won, the confidence of the merchants; there ensued a hiatus of nearly 200 years in the development of English commercial law during which mercantile disputes were rarely settled in court. During the second half of the 18th century, under the vigorous leadership of Lord Mansfield, the common-law courts, stimulated, no doubt, by the novel needs of a society in full course of industrialization, created a new series of legal rules for dealing with mercantile disputes. Meanwhile, the courts of admiralty were cut off from the main streams of commercial activity and of legal thought; an entry in Pepys's diary for March 17, 1663, gives a vivid description of the admiralty judge contriving, with much solemnity, to make a little business go a long way. Not until the 19th-century reorganization of the English court system was there re-established

by statute (3 & 4 Vict., c. 65 [1840]; 13 & 14 Vict., c. 26 [1850]; 24 & 25 Vict., c. 10 [1861]) a court of admiralty with extensive though incomplete jurisdiction over the problems peculiar to the shipping industry. The admiralty court became part of the new high court of justice created by the legislation of 1873-75, forming with the historically related courts of probate and divorce a division of that court; certain county and other inferior courts were also to some degree invested with admiralty jurisdiction in 1868-69; the admiralty jurisdiction of certain other local courts, e.g., in the Cinque ports, was not interfered with. The jurisdiction of the main courts of admiralty has been considerably widened in the 20th century, notably by the Administration of Justice act, 1956, and the County Courts act, 1959. The former high court of admiralty and the modern high court have had exclusive jurisdiction in England and Wales in prize (*q.v.*), except in prize appeals, for several centuries, and the vice-admiralty courts and their successors exercised this jurisdiction in the colonies, dominions and similar territories.

American Developments.—The development in the American colonies followed a different line. During the pre-Revolutionary period vice-admiralty courts exercised, without successful challenge, a jurisdiction much wider than that left to the English admiralty courts. The judges of the vice-admiralty courts were appointed by the crown and, following the tradition of the royal or prerogative courts, sat without juries; for these reasons, and perhaps because of their unsympathetic attitude toward smuggling offenses, the vice-admiralty courts were not popular during the period of ferment which preceded the American Revolution.

Art. iii of the federal constitution, which defines the "judicial power of the United States," provides in sec. 2 that "the judicial power shall extend . . . to all Cases of admiralty and maritime Jurisdiction. . . ." Little is known of the genesis of this notably obscure provision, whose meaning was left to be supplied by congress and the courts. In the Judiciary act of 1789 congress translated the constitutional ambiguity into an equally glaring statutory ambiguity by providing that "the [federal] district courts . . . shall also have exclusive original cognizance of all civil causes of admiralty and maritime jurisdiction . . . saving to suitors, in all cases, the right of a common law remedy, where the common law is competent to give it; . . ." Several times amended, most recently in connection with the revision of the Judicial code in 1948, the substance of the act of 1789 now appears, in slightly different language but with, apparently, no change in meaning, as sec. 1333 of Title 28 of the United States code.

At the outset, the congressional enactment, far from clarifying the situation, served merely to introduce an additional element of confusion; the riddling words of the second branch of the jurisdictional provision came to be known as "the saving-to-suitors clause." The courts, and particularly the U.S. supreme court, were therefore charged with the task of determining the scope of the jurisdictional grant ("all civil causes of admiralty and maritime jurisdiction") as well as that of figuring out a meaning for the saving-to-suitors clause.

The resolution of the saving-to-suitors clause question furnished one of the distinctive features of U.S. admiralty practice. The judicially determined meaning of the clause was this: although a cause of action is within the "admiralty and maritime jurisdiction" and thus (under the first branch of the statutory provision) within the "exclusive original cognizance" of the federal courts (sitting "in admiralty"), the same cause of action may be sued on in a nonadmiralty court (that is, a state court or a federal court sitting, not "in admiralty," but as a civil court of law and equity). What developed therefore was not a body of law, federally created and administered exclusively by the federal courts, but a body of law administered and to some degree inspired by both state and federal sources. State courts developed systems of admiralty law which were quite independent of general or federal maritime law, and the legislatures of many states enacted comprehensive maritime codes. This process was halted by the supreme court's decision in the case of *The Moses Taylor*, 71 U.S. (4 Wall.) 411 (1867), holding unconstitutional a state statute which authorized an *in rem* proceeding against a vessel in a state court. Such a pro-

ceeding, it was held, could be brought only in the federal court in admiralty and was not a "common-law remedy" under the saving-to-suitors clause. *The Moses Taylor* decision made it clear that to some extent admiralty was an exclusively federal domain, but it continued to be thought that in actions brought outside the admiralty court under the saving-to-suitors clause, state courts would apply their own rules of substantive law (for example, that plaintiff's contributory negligence bars an action in tort) even where those rules were inconsistent with the "general maritime law" (under which plaintiff's contributory negligence may cause damages to be divided or apportioned but is not a bar to the action). Considerable doubt was cast on the principle that state courts apply their own law in maritime causes of action by *Southern Pacific Co. v. Jensen*, 244 U.S. 205 (1917), in which the supreme court, holding a state workmen's compensation statute unconstitutional as applied to a longshoreman engaged in work aboard ship, included in its opinion language which suggested that state law is invalid if it "works material prejudice to the characteristic features of the general maritime law or interferes with the proper harmony and uniformity of that law in its international and interstate relations." Thereafter, in a series of cases decided during the 1940s and 1950s the supreme court seemed to be elaborating what might be called a theory of maritime-law supremacy. The supremacy theory was expressed principally in cases involving actions by seamen and other maritime workers for death or personal injuries. The court was closely divided on these issues, and shifts in its membership in the late 1950s led to a series of decisions (e.g., *The Tungus v. Skovgaard*, 358 U.S. 588 [1959]) which indicated that the supremacy theory might be confined within its present limits if not curtailed.

Jurisdiction of Admiralty Courts.—In addition to their civil jurisdiction, admiralty courts in England and the United States have long exercised a jurisdiction over crimes committed on ship-board. This jurisdiction passed to the ordinary courts in England in 1834. The general theory is that a national court has jurisdiction to try crimes committed in its own territorial waters as well as crimes committed by its own nationals or citizens or on ships flying the national flag on the high seas or within the territorial waters of another nation. Applicable principles of international law and comity will determine the extent to which a national court is entitled to assert, or will assert, jurisdiction over crimes committed on foreign ships within its territorial waters.

For several centuries the law of prize has been a distinctive feature of the practice of admiralty courts in wartime. A captured enemy ship may be brought into port and, if adjudicated as lawful prize by the admiralty or vice-admiralty court exercising the prize jurisdiction, will be sold by the court, with the proceeds being divided among the state and the captors. The hope of prize money no doubt stimulated the efforts of privateers who, until the middle of the 19th century, might act with official permission as adjuncts to the regular naval fleets in wartime. During the 19th century, warships became bigger, more expensive and more destructive, and privateering was outlawed by international agreement. The opportunity for amateurs to turn a state of war into a profitable commercial venture on the high seas was thus lost, and naval warfare became a matter for professionals. The institution of prize became a matter in which only states and naval personnel could profit.

In both Great Britain and the United States the admiralty courts exercise a limited jurisdiction over maritime causes of action. Only admiralty courts have power to entertain a proceeding *in rem* against a ship to enforce maritime and similar liens. The admiralty courts sit in civil cases without juries, except that in the United States a special statute confers a right of jury trial in Great Lakes cases; they have traditionally followed a simple, flexible and non-technical procedure. Since access to these specialized courts, with their special powers, depends on the existence of a maritime cause of action, much attention has been given to the dividing line between what is, in a legal sense, maritime and what is nonmaritime. In general, British and U.S. law are in substantial agreement on the demarcation; indeed, to a considerable degree this body of law is supranational and world-wide.

One basis of admiralty jurisdiction is territorial: the occurrence on navigable waters of some event of a maritime nature which relates to a vessel or to her cargo. Under this branch of the jurisdiction fall crimes (including piracy), torts such as collisions, injuries to crew members and passengers, damage to cargo and salvage, which is *sui generis*, being based neither on tort nor on contract (though there may be a salvage contract). In England the jurisdiction was restricted to the high seas up to the middle of the 19th century. In the United States, no doubt because of the great economic importance of the inland waterway system, the English limitation was abandoned at about the same time (*The Genesee Chief v. Fitzhugh*, 53 U.S. [12 How.] 443 [1851]); all inland waterways, whether they be lakes, rivers or canals, which are in fact navigable in interstate or foreign commerce, and in England virtually all waters and their shores, are within the jurisdiction. The requirement that some kind of floating structure which constitutes a "vessel" be involved leads to occasional litigation about odd objects which, by accident or design, find their way into navigable waters. The older cases, both English and American, took the vessel limitation seriously, with the result that such things as navigation beacons and dry docks which had broken loose from their moorings were held not to be subject to the maritime rules of salvage (*q.v.*). Recent cases in the U.S. have taken a less restrictive approach, while statute has widened the jurisdiction in Britain.

The other principal basis of admiralty jurisdiction is contractual: a dispute arising out of a contract which is considered to be maritime in nature. It was this branch of the jurisdiction that was withdrawn from the English admiralty courts during the 17th century, as noted above, and restored by statute toward the middle of the 19th century.

In the United States a broad contractual jurisdiction was at all times maintained, following the precedents of the colonial vice-admiralty courts. Justice Joseph Story, who was at all times an apostle of federalism, was the most influential exponent of the concept of a broad admiralty jurisdiction; his learned opinion in *De Lovio v. Boit*, 7 Fed. Cas. 418 (C.C.D. Mass. 1815), holding a contract of marine insurance within the jurisdiction, became the classic statement of that approach. In Britain, marine insurance is still not within the admiralty jurisdiction.

The line between maritime and nonmaritime contracts was eventually drawn to include within the admiralty jurisdiction most contracts which would be popularly thought of as closely connected with the business of shipping: contracts for transporting passengers or cargo, for chartering ships, for services and materials furnished to a ship (supplies, repairs, towage, pilotage, wharfage, etc.), for maritime employment, for marine insurance (in the U.S. only), and so on. There are, however, some strange exclusions: contracts to build or sell ships are nonmaritime and, apart from statute, so are mortgages of ships. In lieu of mortgages, maritime law recognized two security interests known as bottomry bonds and respondentia bonds. Bottomry was a loan on the security of a ship, respondentia on the security of a cargo. Both are now obsolete. The peculiar feature of both was that if the ship or the cargo failed to complete the voyage (having been, for example, lost at sea) the lender lost not merely his security but his right to repayment. Any attempt to give the lender a claim that would survive the loss of the ship or cargo was held to convert the bond into a nonmaritime mortgage. In both Great Britain and the United States statutes have conferred maritime status on ship mortgages that comply with the requirements that the statutes impose; these are complex in U.S. law.

Liens.—Many types of maritime claims, whether based on contract, tort or salvage, give rise to maritime liens against the ship or its cargo. In admiralty terminology, the pleading which initiates a proceeding is known as a libel in the U.S., a writ in Britain. Proceedings may be brought either *in personam*, against the shipowner, or *in rem*, against the ship, cargo or proceeds of sale. In *personam*, the decree, if the libellant or plaintiff is successful, is a money judgment against the shipowner. In *rem*, the ship is arrested and kept in the custody of the court unless the owner secures her release by posting a bond for indemnity or, in Britain,

by giving bail. If judgment goes for the libellant or plaintiff in an *in rem* action, the ship will be sold by order of the court or there will be recovery on the bond if the owner does not pay. The sale of a ship by an admiralty court acting *in rem* is said to divest or "execute" all liens against the ship—not merely those liens which may have come into the proceeding in which the ship was sold but all liens everywhere in the world. (By way of contrast, the holder of an *in personam* judgment against a shipowner can, like any judgment creditor, have the ship sold on execution. But such a sale, unlike the admiralty sale *in rem*, does not divest existing liens; the ship, in the hands of the purchaser at the execution sale, remains subject to all existing liens.) Thus, the procedure *in rem* has decisive advantages over the procedure *in personam*, and these advantages become even more striking when the shipowner is insolvent or when, typically following some maritime disaster, the aggregate of claims far exceeds the value of the offending ship. Possession of a claim with maritime lien status has a twofold importance: (1) with some statutory exceptions in Great Britain, only the holder of a maritime lien may bring an action *in rem*; (2) when funds are distributed following judgment in an *in rem* action in which several parties have filed libels or issued writs or have been allowed to intervene, maritime lien claims are paid in full, with priority over claims which are maritime but do not have lien status as well as over-all nonmaritime claims. In Britain, liens are classified as maritime, statutory or possessory; the first two always confer a right to proceed *in rem*.

All maritime torts for which a ship is responsible give rise to liens. Examples of such torts are collisions due to negligent navigation, and injuries to persons or damage to property caused by the negligence of the ship's personnel or by the ship's unseaworthiness. The breach of most types of maritime contracts also gives rise to liens: contracts of affreightment or passage; charter parties; employment contracts of officers and crew; contracts for repairs, supplies and various types of maritime services such as towage, pilotage and wharfage. Breach of a contract, however, gives a lien only when at the time of breach the contract has been to some degree executed or performed—as by delivery of cargo on board ship or by delivery of a ship under a charter party. In the United States, breach of a contract while it is wholly executory—for example, the refusal of a ship to accept cargo which it has agreed to carry or to receive a passenger to whom a ticket has been sold, or the failure to deliver a ship under a charter—creates a maritime claim, but such a claim does not enjoy lien status. A few types of concededly maritime claims have at one time or another, usually for no discernible reason, been denied lien status; examples are the claim of an insurance company for unpaid premiums on a marine insurance policy and the claim of a general agent for advances.

Maritime liens are also given for several types of peculiarly maritime transactions or services. Among these are liens for salvage and, in the U.S., for contributions made to a general average (see AVERAGE).

The ship may have a lien against the cargo. Typically, the lien against cargo is asserted for nonpayment of freight, but it could support a claim for damage caused the ship by the cargo. For enforcement of such a lien the cargo may be proceeded against *in rem* and sold by the admiralty court, just as in cases of *in rem* actions against ships. The peculiarity of the lien against cargo under U.S. law is said to be that it depends on possession and is lost by a voluntary delivery of goods to the consignee.

Under general maritime law there is a complex hierarchy of maritime liens; that is to say, in a proceeding which involves distribution of an inadequate fund to a number of lien claimants, liens of a higher rank will be paid in full in priority over liens of a lower rank. Liens are ranked according to two quite different criteria: the time when they arise and the nature of the transaction or event which gives rise to the lien. (See also LIEN.)

The general rule in the U.S. is that liens rank in inverse order of creation; that is, existing liens are subordinated to liens subsequently created. However, liens of the same class which accrued on the most recent voyage all share equally, and all enjoy priority over the liens which accrued on the preceding voyage.

With respect to class, the highest priority goes to seamen's claims for wages. Since the criteria of time and class are quite different, it is obvious that clarity and predictability in the law are, even theoretically, impossible. Indeed, for a hundred years commentators have regularly bemoaned the extraordinary degree of confusion which marks the question of lien priorities. From the fact that the confusion has been allowed to persist, it may be concluded that a certain vagueness or formlessness in the legal categories, which leaves ample room for judicial maneuver, meets the needs of the situation. Without much exaggeration, it can be said that a trial judge, in decreeing the distribution of an inadequate fund among competing lien claimants, can find authority and precedent for almost any distribution which appears to him to be reasonable. Furthermore, appeals from decrees of distribution are rarely taken, so that, in the absence of authoritative statements by appellate courts, the law becomes progressively more unsettled and parochial.

In Britain, similarly, the priorities of various kinds of liens have always been a matter of difficulty. It is said that, subject to special priorities of payment accorded to court fees and, by certain statutes, to various harbour authorities, e.g., for dock dues or wreck raising, there are two cardinal principles: (1) that liens arising from contract or for salvage rank in the inverse order of their attachment and (2) that tort liens rank before contract claims. Claimants having similar liens tend to be ranked together *pro rata*. Decisions as to priorities are nearly always reserved by the court until all claims have been adjudged. Priorities are governed by the law of the court in which the action is brought.

Limitation of Liability.—A distinctive feature of maritime law is the privilege accorded to a shipowner and certain other persons, e.g., charterers, to limit their liability, under certain circumstances, in respect to both tort and contract claims. In the United States the limit, with some exceptions (see below), is the value of the ship. The basic condition of the shipowner's privilege is that he must be free from "privity or knowledge"; this formula (which is common in the limitation law of maritime countries) means, roughly, that the shipowner is not liable for losses caused by faulty navigation but may be liable for losses caused by the ship's unseaworthiness which could have been corrected before the voyage. In a sense the limited liability of shipowners may be compared to the limited liability that any investor may now achieve by incorporating his enterprise. However, the limited-liability idea in maritime law long antedates the emergence or invention of the modern corporation or limited company; its early appearance in maritime law may be taken as a recognition of the extraordinary hazards of sea-borne commerce and the need to protect the adventurous shipowner, before even the most primitive forms of insurance became available, from a crushing burden of liability. Modern commentators have often suggested that the peculiar features of maritime limitation of liability have outlived their usefulness; the development of insurance and of the modern limited liability company has radically altered the conditions out of which the shipowner's privilege originally grew. Although no maritime country has yet gone to the length of abolishing limitation of liability, shipowning interests appear to have become concerned about the possibility of such a development. The Brussels convention of 1957 on limitation of liability proposed a limitation fund substantially larger than that previously available in many countries. The convention was promptly ratified by Great Britain and given statutory force by the Merchant Shipping (Liability of Shipowners and Others) act, 1958. In the United States it was suggested that it would be unwise to submit any kind of limitation legislation to congress on the ground that, once the subject was opened, the result might quite possibly be the abolition of limitation entirely. The U.S. has not adopted the 1957 convention.

In most maritime countries the principle of limitation of liability was considered to be a part of the general maritime law. As it developed in continental Europe the idea, generally stated, was that a shipowner entitled to limitation could satisfy his liability by abandoning the ship (and its pending freight) to claimants. Since the privilege of limitation was, and is, typically invoked

following a large-scale maritime disaster, the abandonment theory meant that claimants got the value of the ship as it was following the disaster. If the ship had sunk or was a total loss with no freight pending, the claimants got nothing. This theory was carried over into the law of many South American countries.

A number of European countries, as well as Brazil, adopted a modification of the abandonment theory proposed by a Brussels convention of 1922. Under the convention the owner retains the privilege of abandoning his ship in full satisfaction of claims but may, as an alternative, retain the ship and limit his liability to £8 per ton of the ship's registered tonnage (plus an amount for freight) in respect of property claims, with additional provision being made for death and personal injury claims. The convention was described as a happy compromise between British and continental theories of limitation but was, in fact, more favourable to the shipowner than either the British system or the previous continental system.

Great Britain and the United States were the only maritime countries that refused to admit the principle of limitation as part of the general maritime law. In both countries, however, the competitive needs of the shipping industry compelled its reintroduction by statute.

The first British limitation act was passed in 1733 (7 Geo. 2, c. 15), but this related solely to the thefts of cargo by master or crew. The next act, of 1786 (26 Geo. III, c. 86), extended the right to thefts by other persons and loss by fire. Limitation of liability in cases of loss by collision was created by an act of 1813 (53 Geo. III, c. 159), and many others have followed. Until after the middle of the 19th century, English limitation law, much less favourable to shipowners than the continental abandonment theory, set the limitation figure at the value of the ship at the beginning of the relevant voyage—i.e., before the disaster—plus pending freight. In 1854 (17 & 18 Vict. c. 104) it was provided that in case of death and personal injury claims the value of the ship should be taken as not less than £15 per ton. Thereafter in 1862 the actual value of the ship was abandoned as a measure of liability, and limitation was fixed in all cases at £15 per ton in cases of death and personal injury and £8 per ton in case of property damage alone. These provisions were incorporated in the Merchant Shipping act of 1894 and remained in force until amended by the Merchant Shipping (Liability of Shipowners and Others) act, 1958. In the 20th century, particularly after the end of World War II, soaring costs deprived these figures of any relation to reality.

U.S. shipowners apparently did not become concerned about the question of limitation of liability until the middle of the 19th century. The Limitation of Liability act of 1851 was closely modeled on the British statute then in force and was supported in congress as a measure designed to restore U.S. shipowners to a position of competitive equality with British shipowners. The act fixed the maximum liability of a shipowner entitled to limitation at the value of the ship plus pending freight, but gave no indication whether that value was to be calculated after the disaster (the European "abandonment" theory) or before (the English theory under the statute then in force). The legislative history of the act suggested that it should be construed according to British law, but the U.S. supreme court eventually decided (*Norwich & N.Y. Transportation v. Wright*, 80 U.S. [13 Wall.] 104 [1871]) that the principle of limitation was a part of the general maritime law, which the act had merely restored to vitality, and elected to follow the European theory. Thereafter the court decided that a shipowner entitled to limitation could keep for his own benefit any insurance recovery and did not have to put that money into the limitation fund (*The City of Norwich*, 118 U.S. 468 [1886]). These holdings left U.S. limitation law at the end of the 19th century in a state much more favourable to the ship-owning interests than was the corresponding British law. However, as ship values continued to increase, the U.S. formula, in cases where the ship was not a total loss, opened the way to recoveries substantially larger than were available under the British formula, tied to the increasingly unrealistic figures of 1862.

The U.S. act of 1851, consistent with its purpose to restore the

U.S. mercantile fleet to a position of equality with the British fleet, had excluded from its coverage vessels used on the inland waterways: in 1886, however, the act was extended to "all vessels used on lakes or rivers or in inland navigation."

Until 1935 the U.S. Limitation act made no special provision for death and personal-injury claims. Public indignation was aroused in 1934 when the owners of the steamship "Morro Castle," which burned off the New Jersey coast with large loss of life, petitioned to limit their liability to \$20,000. The following year congress added to the Limitation act provisions, modeled on those of the British act, requiring that a special fund in the amount of \$60 per ton be set up to satisfy death and personal-injury claims. The loss-of-life provisions apply only to "seagoing vessels."

The Brussels convention of 1957 on limitation of liability adopted the structure of British limitation law, setting the limitation fund at amounts of about £23 and £73, which were closer to actual ship values. In cases of loss of life or personal injury there were provisions for a "minimum tonnage" of 300 tons, where the limiting ship was in fact smaller than that tonnage. This has removed a source of great injustice. The convention figures were stated in terms of the gold content of Poincaré francs and would convert into U.S. dollars (1958) at \$140 per ton for death and personal-injury claims exclusively with another \$67 per ton to be shared ratably by such claims and property claims. As stated, the convention has not been adopted by the U.S.

In general, the limitation law of any country will be applied by its own courts in favour of foreign shipowners as well as of citizens. From the point of view of shipowning interests, however, a major weakness of limitation law has been the fact that decrees of limitation (unlike *in rem* decrees of admiralty courts) are not given international recognition (*The Titanic*, 233 U.S. 718 [1914]). That has meant that a shipowner whose ships move in international trade could find himself sued in several countries, as a result of one disaster, and forced to set up limitation funds in each country (although in Britain an owner who paid claims in foreign proceedings was allowed to credit those amounts against the British limitation fund). The Brussels convention of 1957 makes limitation decrees delivered by admiralty courts in ratifying countries internationally effective; that is, a shipowner could be required to set up only one limitation fund, out of which all claims would be paid, no matter in how many countries proceedings might be instituted against him. Thus the convention, which increases the liability of shipowners in most countries, does offer in return this considerable advantage to the group of shipowners whom the present rule affects adversely. Special provisions are likely to be applied by international convention to damage caused by nuclear-powered ships. Special limitation already exists with regard to cargoes of nuclear material (7 & 8 Eliz. II, c. 46).

Marine Insurance.—An appreciation of the part played by marine insurance (q.v.) is essential to an understanding of the shipping industry and the special law which governs it. With certain obvious exceptions, such as claims for death and personal injury and claims of seamen for wages, the great majority of claimants have insured themselves. The shipowner carries hull insurance on his own ship and protects himself against claims by third parties under a variety of arrangements. Water-borne cargo is almost universally insured against the perils of the seas. It is impossible in a brief outline such as this to go into any of the special intricacies, which are many, of marine insurance law. The point to be borne in mind is that any case of property damage, to a ship or its cargo or to ships in collision, resolves itself into a settlement between insurance carriers. Proposals for reform of the maritime law must always be evaluated against this background of universal insurance coverage. Abolition of the shipowner's privilege to limit his liability or of the peculiar maritime rules of general average or an increase in ship's liability to cargo would all mean not much more than that insurance now taken out and paid for by A would be taken out and paid for by B, who would pass on the additional cost of his insurance in the rates or prices charged to his customers. Since the same insurance carriers write both hull and cargo insurance, the end result of such reforms would be merely a redistribution of business among their several

departments. Except for litigation involving death and injury claims in the U.S., there appears to have been during the 20th century a notable decrease in maritime litigation of all sorts. It is reasonable to suppose that this decrease is related to the increasing availability of all-risk insurance; insurance carriers notoriously, and commendably, prefer settlement or arbitration to litigation, even when a given carrier does not find itself in the position of having insured both parties.

Marine insurance is the oldest form of insurance that is known. Indeed, the institution of general average, under which the participants in a maritime venture contribute to losses incurred by some for the benefit of all, may itself be looked on as a primitive form of self-insurance. Marine insurance in a discernibly modern form made its appearance in the middle ages; many of the medieval sea codes contained regulatory provisions, and a special commission for trying marine insurance cases was provided for in England in 1601 (43 Eliz., c. 12). Modern hull-insurance policies still reproduce the language, which has come to seem quaint and archaic, of the so-called Tiger policy, written in London in 1613. Marine insurance seems to have grown up in the interstices, so to say, of existing maritime law and to have adapted itself to that framework. Until the 20th century it was a characteristic of marine insurance that a substantial number of risks could not be covered, and this remains to some degree true in cargo policies customarily written to exclude losses under stated percentages (the so-called F.P.A. or "free of particular average" clauses—"average" meaning a loss and a "particular average" meaning a loss not made good in a general average contribution). The theoretical basis for exclusion of certain risks is often said to be the furnishing of an inducement to the owner of property to look after it himself, as in the case of the "deductible" feature in the familiar automobile collision-insurance policy. However that may be, the pressures from shipowners for comprehensive insurance coverage have gradually led to the inclusion of almost all risks: "collision and running down" clauses, war risk riders, so-called "disbursements" policies and "P. and I." (protection and indemnity) insurance.

The British Marine Insurance act of 1906 codified British law and was of great influence in the development of U.S. marine-insurance law. The U.S. supreme court has consistently insisted on the need for international uniformity in this field, with the result that both the British codification and British cases have been recognized as authoritative. Nevertheless, certain differences have grown up between British and U.S. practice; for example, in cargo policies variant clauses are in use in the two countries with respect to the risk covered in cases of stranding or collision (the clauses are referred to as F.P.A.E.C. and F.P.A.A.C.—Free of Particular Average, English Conditions; Free of Particular Average, American Conditions). The case of *Wilburn Boat Co. v. Fireman's Fund Insurance Co.*, 348 U.S. 310 (1955), which held that a state statute controlled the decision whether a policy on a houseboat kept on an inland lake was void for breach of warranty, led some commentators to speculate that the supreme court had abandoned its long-held policy of uniformity in the marine-insurance field.

Nature of Maritime Law.—Maritime law is often thought of as being a species of international law rather than a branch of domestic or municipal law. It should not be denied that the international aspect of maritime law gives it a distinctive flavour; in doubtful cases courts of one country will often look to the precedents or statutes of another country for inspiration or guidance, and a relaxed attitude toward the principles of the law of conflict of laws is customary on the ground that the rules of maritime law are world-wide in scope. The supranational nature of maritime law was emphasized in an opinion written by Justice Robert H. Jackson of the U.S. supreme court in 1953: "[C]ourts of this and other commercial nations have generally deferred to a non-national or international maritime law of impressive maturity and universality. It has the force of law, not from extraterritorial reach of national laws, nor from abdication of its sovereign powers by any nation, but from acceptance by common consent of civilized communities of rules designed to foster amicable and workable commercial relations" (*Lawritzen v. Larsen*, 345 U.S.

571 [1953]). Traditionally, the interplay between British and U.S. courts in this field has been close and continuous.

It is, however, possible to overstate the degree to which maritime law is a branch of the law of nations. Justice Oliver Wendell Holmes pointed out long ago: "The maritime law is not a *corpus juris*—it is a very limited body of customs and ordinances of the sea" (*Southern Pacific Co. v. Jensen*, 244 U.S. 205 [1917]). In all countries there is a discernible tendency to codify maritime law, and the nature of national statutes in the U.S., at least, is such as to preclude reference to outside sources of law. It is undoubtedly true that maritime law in the U.S. in the mid-20th century was much more a creature of nationalism than it had been 100 years earlier.

Countervailing pressures of an internationalist kind, however, have been of considerable importance in many countries, and the tendency is growing. Since the late 19th century the Comité Maritime International has produced a series of international conventions. While many of these conventions have failed to be widely ratified, others have been highly successful, such as the convention on the Carriage of Goods by Sea of 1922 and the Safety of Life at Sea convention of 1929. There are, of course, many more maritime conventions in existence. The U.S. and Great Britain have not adopted a uniform policy with regard to them. The former, for example, did not ratify the Brussels convention of 1910, which, among other things, abolished the presumption of fault for breach of collision regulations and failure to "stand by" after collision, abrogated the rule of equal division of loss in case of collision where both colliding vessels are at fault, and introduced the two-year period of limitation of action in collision and salvage cases. Great Britain has not ratified any convention relating to salvage.

The international rules of navigation, the result of recommendations of the Safety conference held at London in 1948 and adopted by statute in many countries, including Great Britain and the United States, are in effect an international code of navigation on the high seas; these rules of the road are of the greatest importance in determining fault in ship collision. A further safety conference held in London in 1960 revised the current navigation rules. (See RULES OF THE ROAD AT SEA.) In other fields much has been accomplished to ensure international uniformity through private agreements voluntarily adhered to by affected interests; the York-Antwerp Rules of General Average, first promulgated in 1890 and most recently amended in 1950, are the best-known example of such agreements which, although they do not technically have the force of law, nevertheless, by incorporation in charter parties and bills of lading, determine the shape of the law as effectively as any statute.

It may also be that the widespread submission of maritime disputes to arbitration, where the informality of the procedure facilitates escape from aberrant national rules, reflects the stubbornly international bias which has characterized the shipping industry from earliest times.

MARIUS (MARCUS AURELIUS MARIUS), rival Roman emperor A.D. 268, probably in Cologne, is said to have been a workman (*faber*) who assumed the purple on the murder of Postumus,

and to have reigned two days. But his numerous coins indicate a reign of at least some months. (J.N. R. M.)

MARIUS, GAIUS (157–86 B.C.), consul seven times (in 107, 104–100, 86), a great general and the first Roman to illustrate the political support that a successful general could derive from the votes of his old army veterans. Born, as was Cicero later, at Arpinum (Arpino), the son of a farmer, he was taken up by the Metelli (see METELLUS) and married into the family of the Julii Caesares. Tribune in 119, praetor in 115 and governor of Farther Spain in 114, he served on the staff of the consul Quintus Caecilius Metellus Numidicus against Jugurtha in 109. In returning to Rome in 108 to canvass for the consulship he defied Metellus and, to secure the support of business men (*equites*) and populace in Rome, he unscrupulously discredited Metellus' conduct of the war. He was elected consul, appointed successor to Metellus by a popular bill and, together with other reforms in military organization and equipment, revolutionized recruiting practice by enlisting volunteers from those who were too poor to be liable to conscription (*capite censi*). Lucius Cornelius Sulla, his quaestor in 107, won Marius' abiding jealousy by securing the surrender of Jugurtha in 105 at the end of the two years of Marius' own successful campaigning. Marius was transferred to the command of the war against the Cimbri and Teutones, after the heavy defeat of the Roman army at Arausio (Orange) in 105, defeated the invaders at Aquae Sextiae (Aix-en-Provence) in 102 and, with Q. Lutatius Catulus, his colleague as consul in 102, at Vercellae (Vercelli) in Cisalpine Gaul in 101. He was consul, with his friend L. Valerius Flaccus as colleague, for the sixth time in 100.

The veterans of his African army had already been settled in Africa in colonies, some of which were called after him, by a bill of L. Appuleius Saturninus (*q.v.*) as tribune in 103. In 100 Saturninus, tribune again, made proposals for the settlement in Transalpine Gaul of men who had served in the Cimbric war, and for Latin colonies in Sicily and Macedonia-Achaea in each of which Marius was to be allowed to create three Roman citizens. (Already in the Cimbric war he had broken the law by giving Roman citizenship to two cohorts of the Italian Camertes on the battlefield, with the excuse that "in the din of battle he could not hear the law.") Marius combined with Saturninus and the praetor Gaius Servilius Glaucia in opposing the senate, but he was not statesman enough to handle the political complexity of events, first the hostility of the urban proletariat to the land bill (on the ground that its own interests were disregarded) and then the evidence that Saturninus and Glaucia were embarked on mob violence and unconstitutionality. The clause in the land bill compelling senators to swear within five days to observe it led to the exile of Metellus, who refused to swear, Marius having equivocated by remarking that "he swore to obey the law as far as it was one." He subsequently abandoned Saturninus and Glaucia and after the passing of the last decree (*senatus consultum ultimum*) following on disorder at the consular elections (at which he or Valerius had refused to accept Glaucia's candidature) Saturninus and Glaucia, who had seized the Capitol, were forced to surrender. Marius had no responsibility for their murder.

After this he traveled in Asia. He commanded an army which defeated the Marsi in the Social War (or "war of the allies," 91–89). After the failure in 88 of P. Sulpicius Rufus' attempt to replace Sulla by Marius as commander in the war against Mithradates VI, he fled south (evading his pursuers in the marshes of Minturnae), and thence to Africa, returning the next year when Sulla had gone east, collecting an army and with L. Cornelius Cinna (*q.v.*) capturing Rome. There followed a hideous massacre of their political opponents, including Catulus, and for Marius a seventh consulship, for 86, which he survived 13 days (he died from natural causes). For portrait see article ROMAN HISTORY.

His son Gaius Marius, consul in 82, committed suicide at Praeneste after Sulla's return and capture of Rome in that year. The family was then extinct and Marius' reputation was eclipsed until his nephew Julius Caesar replaced his trophies on the Capitol in 65. The lost sources from which ancient accounts of him largely derive were unfriendly: the historian Sisenna, an admirer of Sulla,

and Sulla's own autobiography. Sallust's surviving *Bellum Iugurthinum*, written after Caesar's death, is a powerful, but not altogether uncritical, rehabilitation.

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE (1688–1763), French novelist, playwright and moralist, author of two novels among the most outstanding of the 18th century, and of plays second only to those of Molière in their popularity with French audiences, was born in Paris on Feb. 4, 1688. His father, Nicolas Carlet, took him to Riom (Auvergne), where he had been appointed comptroller of the mint, in about 1696. From 1710 to 1713 Marivaux, who had returned to Paris, studied without much enthusiasm at the École de Droit. He was already thinking of his first works. These were novels, some romantic, like *Les Effets surprenants de la sympathie* (1712–13), in imitation of Cervantes and Gautier de Costes La Calprenède; others semi-parodic and semi-romantic, like *La Voiture embourbée* and *Pharsamond* (1713, later entitled *Le Don Quichotte moderne*); and lastly, the satirical burlesque *Le Télémaque travesti* (1714, supplemented by *L'Iliade travestie*, in verse, 1714–16). These early works do not show an assured talent but they are interesting and unusual, and characteristic of a writer trying to find his way.

In 1717 Marivaux married Colombe Bollogne of Sens (d. c. 1723, leaving him a daughter, b. c. 1719, who was destined to become a nun). After his marriage Marivaux turned his attention to more serious writings: little satires on Parisians and coquettes; articles of literary criticism hostile to the *Anciens* and favourable to the *Modernes*; philosophic and moral reflections on the social classes, the condition of women, etc. These appeared as articles in *Le Mercure de France* (1717–20), then in a periodical of his own inspired by Joseph Addison and his Dutch imitators and entitled *Le Spectateur français* (1720–24). The same "philosophic" view, in the then current sense, showed itself in other journals, *L'Indigent Philosophe* (January–June 1727), *Le Cabinet du philosophe* (1733–34), and in plays. *L'Île des esclaves* (1725), *L'Île de la raison* (1727), which can be compared with *Gulliver's Travels*, and *La Nouvelle Colonie* (1729). This vein was also revealed in his discourses at the Académie Française, to which he had been elected in 1742, and in articles in *Le Mercure* (*Le Miroir*, 1755).

Marivaux's interest in the drama seems to have been inspired by meeting the Italian troupe brought to France by Luigi Riccoboni. Its most famous actors were Sylvia (Gianetta Rosa Benozzi) and Arlequin (Thomas Antoine Vicentini), for whom Marivaux wrote his best plays: *Arlequin poli par l'amour* (1720), in which the stage setting is of considerable importance, *La Surprise de l'amour* (1722), *La Double Inconstance* (1723), *Le Prince travesti*, *La Fausse suivante* (1724), *Le Jeu de l'amour et du hasard* (1730), *Le Triomphe de l'amour*, *L'École des mères* (1732), *L'Heureux stratagème* (1733), *La Mère confidente* (1735), *Les Fausses confidences* (1737), *Les Sincères* (1739) and *L'Épreuve* (1740). The plays produced at the Théâtre Français were fewer and less successful. The most notable, besides his tragedy *Amnibal* (1720), are the comedies *Le Dénouement imprévu* (1725), the theme of which heralds Alfred de Musset's *La Nuit vénitienne*, the second *Surprise de l'amour* (1727), a variation on the play presented at the Théâtre Italien, *Les Serments indiscrets* (1732), his only play in five acts, *Le Legs* (1736) inspired by a comedy of Bernard de Fontenelle, *Le Testament*, *La Dispute* (1744) and *Le Préjugé vaincu* (1746).

All these plays—more than 30—make up a varied theatrical output, ranging from the pure comedy of intrigue (*La Fausse suivante*) to heroic comedy (*Le Prince travesti*); from the play of contemporary manners reminiscent of William Congreve (*La*

Petit-maitre corrigé, 1734) to the fairylike fantasy (*Arlequin poli par l'amour*) or to the classical fantasy (*Le Triomphe de l'amour*). But in almost all are displayed his characteristic qualities: dialogue so spirited and witty that the word *marivaudage* has been coined to describe it, an acute sense of nuance and of the finer shades of feeling, a sensitivity and delicacy which never degenerate into mawkishness and do not exclude moments of downright boisterous comedy (*Le Jeu de l'amour et du hasard*, *Les Fausse confidences*). These explain the eminent position which Marivaux enjoys in the French theatre where, after Molière, he is the most acted playwright and one of the most living—a fact attested by the many productions of his least-known plays at, for example, the Théâtre National Populaire.

A playwright of unquestioned fame, Marivaux is also among the most gifted 18th-century French novelists. His *Vie de Marianne*, the 11 parts of which took 11 years to appear (1731–42), constitutes a considerable novelty in the history of the French novel: the celebrated "reflections" woven into the narrative gave a new dimension to the novel, exhibiting a technique which calls to mind that of Proust. *La Vie de Marianne* has been compared with Samuel Richardson's *Pamela*. In fact, the likeness is probably to be explained by a common source—*Les Illustres françaises* by Robert Challes (1713). But the comparison is interesting for the differences it reveals. Briefly it may be said that Marivaux's ethic is grounded neither in traditional morality nor in a cult of the passions but in respect for the human person as such, whether this be self-respect (as in *Marianne*, for example) or that respect for others demanded by *Marianne* and shown especially by Mme de Miran.

In contrast to *La Vie de Marianne*, which deals with aristocratic society and is dedicated to the glorification of woman's feeling and intuition, stands *Le Paysan parvenu* (1735–36), a novel dominated by Jacob, a young peasant with a peasant's failings (lack of excessive scruple, artless self-satisfaction, fickleness in love), but having a countryman's resources—good humour, crafty frankness and, in addition, sparkling eyes and a fresh complexion. Shorter and terser than *La Vie de Marianne*, bolder too in the scenes where Jacob is *en tête à tête* with women older than he who are captivated by his person, *Le Paysan parvenu* is often regarded as Marivaux's romantic masterpiece.

Assailed by critics who, like the Abbé Desfontaines, accused him of "néologie"; envied by Voltaire, who intrigued against him; and exercising his talents in fields which were looked upon as inferior (comedy and the novel), Marivaux did not become famous during his lifetime, as is shown by the fact that none of his correspondents preserved his letters. Pre-eminently *un bon et honnête homme*, he is the only man of letters of whom J. J. Rousseau speaks nothing but good. He had devoted friends in Houdar de la Motte, Fontenelle, Mme de Lambert, Mme de Tencin, C. A. Helvétius and Jean d'Alembert, but he survived most of them just as he survived his own reputation. Himself extremely charitable, he depended in his old age on the help of an old friend, Mlle de Saint Jean, and died in poverty in Paris on Feb. 12, 1763.

BIBLIOGRAPHY.—The least faulty general edition of Marivaux is that of 1781 in 12 vol., which does not, however, include the satire *Le Balbouquet* (1713), never reprinted; the novel, *Le Télémaque travesti*, the greater part of which was unknown until the complete work was published in an edition by F. Deloffre in 1956; and several articles (cf. *Revue des Sciences Humaines*, 1954, pp. 5–24 and 97–115). Most modern editions reproduce a text arbitrarily adapted by the publisher of the 1825–30 edition. Only a few reproduce the original text of *La Vie de Marianne* and *Le Paysan parvenu* (Garnier, 1957); of some plays (*Théâtre choisi de Marivaux*, Sansoni, 1959, *Le Petit-maitre corrigé*, 1955); and of *Le Miroir* (Libreria Scientifica Editrice, 1958). See also G. Larroumet, *Marivaux, sa vie et ses œuvres* (1882), still useful in spite of errors and omissions; F. Deloffre, *Marivaux et le marivaudage* (1955); and, for its biographical importance, Mme M. J. Durry, *À Propos de Marivaux* (1960). Two discerning essays are those by G. Poulet in *Études sur le temps humain*, vol. ii, pp. 1–34 (1952), and that by Leo Spitzer, in reply, "À Propos de la Vie de Marianne," in *Romanic Review*, vol. xlv, no. 2 (April 1953). In English the most noteworthy studies are Ruth K. Jamieson, *Marivaux: a Study of Sensibility* (1941); K. N. McKee, *The Theater of Marivaux* (1958); and a special issue, devoted to Marivaux, of *L'Esprit Créateur* (winter, 1961).

MARJ, AL: see BARCE.

MARJORAM, aromatic herbs or undershrubs, belonging to the genera *Origanum* and *Majorana* of the mint family (Labiatae). Wild marjoram (*O. vulgare*), a perennial native to Europe and Asia, is common in dry copses and on hedgebanks in England and is naturalized in the eastern United States. It has many stout stems, one to three feet high, bearing short-stalked somewhat ovate leaves and clusters of purple flowers. Sweet marjoram (*M. hortensis*) and pot marjoram (*M. onites*) are cultivated for their aromatic leaves, either green or dry, used in cooking; the tops are cut as the plants begin to flower and are dried slowly in the shade. See **FOOD PREPARATION: Herbs and Spices**.

MARK, SAINT, evangelist, an apostle of first-generation Christianity and the traditional author of the second Gospel (see **MARK, GOSPEL ACCORDING TO SAINT**). His symbol, therefore, has become the lion, the second animal at the throne of God (Ezek. i, 10; see Rev. iv, 7). In the New Testament, Mark is mentioned several times, but even an uncritical combination of this information produces only a very fragmentary picture. Furthermore, critical investigation has raised serious doubts about the historicity of most of the given data.

The only unquestionably reliable information is to be found in Phil. 24, where a certain Mark is mentioned as one of Paul's fellow workers who sends greetings from Rome to the Christians at Colossae. But there is no indication there as to the identity of this person. The information in Col. iv, 10, that the Mark of Paul's company was a cousin of Barnabas, may also be authentic, although the Pauline authorship of Colossians is not beyond doubt.

Acts xii, 12, 25 and xv, 37 speaks about "John whose other name was Mark," and xiii, 5, 13 simply says "John"; but elsewhere in the New Testament he is known by his Latin surname Mark (a name related to that of the god Mars). Acts also relates that his mother's house in Jerusalem was a centre of Christian life (xii, 12), and that Barnabas and Paul took him along to Antioch (xii, 25) whence he became their assistant on a mission journey (xiii, 5). When they arrived at Perga in Pamphylia, however, Mark left them and returned to Jerusalem (xiii, 13). According to Acts, this was the reason why Barnabas and Paul later separated, because Barnabas insisted on giving Mark another chance, while Paul declined (xv, 37–39). Subsequently, Mark sailed to Cyprus with Barnabas, never to be mentioned again in Acts.

The dependability of the Acts account is highly questionable. The writer of Acts is particularly interested in finding a reason for the breach between Paul and Barnabas, and probably introduces the rather colourless figure of John Mark for this very reason; but in so doing, he contradicts Paul's own account (Gal. ii, 11–14). What did the author of Acts actually know about Mark? Apparently he had only the information contained in the Pauline Epistles; i.e., he knew about a Mark who was mentioned among Paul's company as a relative of Barnabas.

II Tim. iv, 11, which pictures a forsaken Paul requesting Timothy to bring Mark "for he is very useful in serving me," is almost certainly a pseudopigraphic synthesis of data from Acts and Colossians. Greetings from "my son Mark" are included in I Pet. v, 13, which was written from Rome ("Babylon"); and a close relationship between Mark and Peter also is suggested by Papias' presbyter tradition, which identifies Mark as the interpreter of Peter and thus the author of the Petrine Gospel. But this seems to be a wishful identification aimed at giving the Gospel greater authority. If I Peter is spurious, as many scholars are convinced, its mention of Mark is a part of the device of pseudonymity which only proves that the tradition connecting Mark with Peter and Rome goes back to the end of the 1st century A.D.

Later tradition assumes that Mark was one of the Seventy (Luke x, 1), and identifies him with the young man fleeing naked at Jesus' arrest (Mark xiv, 51 f.). The tradition first mentioned in Hippolytus (*Refutation*, vii, 30, 1) metaphorically calls Mark "shortfingered," since his Gospel is the shortest of the Gospels. Mark also was claimed by the Egyptian church as its founder, and from the 4th century A.D. the Alexandrian see has been called *cathedra Marci*. Dependent on the tradition that connected Mark with Peter and Rome, the church of the once important city of Aquileia (north Italy) traced its origin back to Mark. In the 6th

century refugees from Aquileia were among those who founded Venice, of which Mark became the patron saint (a fantastic legend tells how Venetian merchants stole Mark's remains from Alexandria), and Venice's glory and predominance gave Mark's winged lion widespread fame throughout the middle ages. St. Mark's feast day is April 25.

MARK, GOSPEL ACCORDING TO SAINT, in canonical order the second of the four Gospels of the New Testament. As the earliest of the three so-called Synoptic Gospels it was used as a source by the others, Matthew and Luke (see **GOSPEL**). Since Mark also was probably the first Gospel ever written, its outline of the life and ministry of Jesus can be considered as the first attempt to present the whole tradition of Jesus in a continuous "story."

Composition.—The core of Mark's Gospel is the Passion narrative, which Christian tradition already had formulated on the basis of the actual order of events in Jesus' trial, Passion and death. This comprises about 40% of Mark (in Luke, it is only 20%). To this core, the author of Mark added other traditional materials (mainly narratives), thereby extending the Passion narrative backward into a life of Jesus. The term Gospel, which originally meant the oral preaching about Jesus' death and resurrection, was used for the first time in Mark as the leading motif for a literary composition concerning the entire story of Jesus. Since in Mark this term occurs exclusively in editorial sentences, it was clearly the author of Mark himself who applied the word Gospel to tradition that previously had not been so designated. Therefore, the author of Mark may justly be called the creator of the early Christian literary form, Gospel.

The outline of the Gospel of Mark is certainly more primitive than that of Matthew and Luke, but it is nevertheless largely the result of the author's own editorial work and reflects his own theological understanding of Jesus. The framework of the Gospel contains very little reliable historical information. Only a few geographical references and personal names already were associated with the narratives used by Mark; e.g., Capernaum (i, 21; ii, 1), the Sea of Galilee (i, 16, etc.), Dalmanutha (viii, 10), Caesarea Philippi (viii, 27), John the Baptist (i, 4-11; vi, 14-29, which also includes Herod) and Peter (viii, 27-29). Especially in the Passion narrative, persons and places are original elements of the tradition.

But beyond these few instances, the framework of Mark is an artificial device by which originally isolated stories are combined and some kind of chronological sequence is established (see, for example, the common phrase "from there he went to . . ."). Some scenery is always at Mark's disposal to give life to the picture, as "the sea" (ii, 13, etc.), "the other side of the sea" (v, 1, 21), a "lonely place" (i, 35; vi, 32), "hills" (iii, 13, etc.) or the "synagogue" (i, 21 ff., etc.). Seldom is a direct chronological connection made except during the Passion week narrative. The persons pictured in the Gospel are partly the author's own editorial work, partly already presented in the tradition. The "crowd" (ii, 13 ff., etc.) serves as the background for Jesus' acts and preaching, and is artificially introduced and quickly forgotten; the opponents appear abruptly whenever they are necessary for a controversy; the disciples frequently are nothing more than a foil for Jesus' miraculous power, belonging to Jesus' company as a matter of course, but scarcely anywhere acting as independent personalities.

Mark is not, however, simply a mechanical compilation by means of such technical devices, but both in its essential structure and in its details it is thoroughly governed by theological principles. These are most evident first in the arrangement of the traditional material, second in the short comprehensive summaries of Jesus' activity inserted by the author himself (i, 32-34; iii, 7-12; vi, 53-56), and finally in the introductions and conclusions he has added to many traditional stories.

Outline.—Mark's Gospel deals with the following:

i, 1-13:	"Beginning of the Gospel" (the Baptist)
i, 14-viii, 26:	the Galilean ministry
i, 14-iii, 35:	first disciples, healings and controversies
i, 14-ii, 12:	activity around Capernaum
ii, 13-iii, 12:	first conflicts
iii, 13-35:	first crisis and separation (calling of the Twelve, Beelzebul controversy, true brethren)
iv, 1-viii, 26:	around the Sea of Galilee
iv, 1-34:	mystery of the parables
iv, 35-v, 43:	the great miracles (tempest, Gadarene [Gerasenes] demoniac, Jairus' daughter)
vi, 1-56:	the great events (Nazareth, death of John the Baptist, sending of the Twelve, feeding of 5,000)
vii, 1-viii, 26:	the great controversy (clean and unclean, healings and feeding of 4,000, discourse on signs and heaven)
viii, 27-x, 52:	from Galilee toward the Passion in Jerusalem
viii, 27-30:	confession of Peter
viii, 31-ix, 29:	the right understanding of discipleship (transfiguration)
ix, 30-x, 31:	problems of discipleship (discussions about greatness, offense, marriage, the rich young man)
x, 32-52:	Christ and the disciples on their way to Jerusalem (the sons of Zebedee)
xi, 1-xv, 41:	the Jerusalem ministry and the Passion
xi, 1-xiii, 37:	the closing ministry
xi, 1-11:	first day: entry into Jerusalem
xi, 12-19:	second day: cleansing of the Temple
xi, 20-xii, 44:	third day: Jesus' authority—the wicked husbandmen; controversy with Jerusalem's leaders (tribute to Caesar, great commandment, David's son)
xiii, 1-37:	mystery of the future ("the Little Apocalypse")
xiv, 1-xv, 41:	Passion of Jesus
xiv, 1-42:	the preparation (anointing, betrayal, Last Supper, Gethsemane)
xiv, 43-xv, 20:	the trial of Jesus
xv, 21-41:	crucifixion and death
xv, 42-xvi, 8:	conclusion (burial and empty tomb)
(xvi, 9-20:	spurious ending: the appearance of the Risen Lord)

Themes.—The introduction makes it clear that the "Gospel" means not only Passion and Resurrection but the entire Jesus event. The story of Jesus' temptation (i, 12-13) shows symbolically the meaning of Jesus' activity. It is the eschatological battle between God and Satan in history.

The first main section of the Gospel depicts this struggle in a strange way. Jesus' ministry is limited to Galilee, which He leaves only occasionally (Decapolis, Tyre) and never for Jerusalem. Almost all of the Marcan miracle stories are found in these first eight chapters, and except for the parable chapter (iv) this section contains almost no sayings and few discourses. Thus the "Galilean ministry" is concerned with the revelation of Jesus' messiahship in his mighty works. But this is at conflict with another motif found in Mark's editorial comments—the "Messiah secret": (1) Jesus repeatedly forbids public announcement of his messiahship (i, 34, 44, etc.); (2) he speaks in parables in order to prevent the crowd from understanding the message (iv, 10-12, 33-34); (3) even the disciples appear to be completely blind and without understanding of Jesus' messiahship (vi, 52; viii, 14-21). Without any doubt such a description of Jesus' ministry contradicts both the historical reality and the tendency of the already messianized narrative traditions used by Mark. But in extending the primitive Gospel (that the Messiah has paradoxically overcome the Satanic powers in his suffering and death) to include Jesus' life, Mark is primarily interested in the theological comprehension of that life. Accordingly, the Marcan edition of Jesus' life emphasizes his *mysterious* struggle for power with Satan in history. For Mark, the fact that the Messiah had to suffer necessarily implies that Jesus' ministry had to be described as concealed revelation.

Peter's confession (viii, 27-30) is an exemplary description of one acknowledging Jesus as the Christ, but it is rebuked since it does not also include the recognition that the Messiah has to win his battle through suffering and death. This becomes the theme of the central part of the Gospel, where both Jesus' messiahship and the anticipation of suffering are disclosed to the

disciples. Miracle stories are incidental to this section (only ix, 14-29 and x, 46-52). Instead, Mark assembles stories and discourses that are concerned with the disciples' facing suffering. Predictions of the Passion run through these chapters like an unbroken thread (viii, 31; ix, 31; x, 32-34), not as a recollection of the actual psychological preparation of the disciples for the Passion, but as a presentation of those traditions which Mark considers to be the very centre of Jesus' message for the church. In contradistinction to the other Gospels (Matthew and Luke) Mark does not portray Jesus primarily as preaching the coming of the Kingdom, but as calling his "disciples" (i.e., the church) to participate in his own eschatological struggle with Satan.

The last part of the Gospel presents Jesus' ministry in a strikingly different way. The location is restricted to Jerusalem; miracle stories are totally lacking; Jesus' action is now pictured as attack and victory much more than before (see especially the great discussion with Jerusalem's leaders in xii, 13-44); and the motif of concealment is missing. The entry into Jerusalem and cleansing of the Temple present Jesus in the open display of his messiahship. The so-called Synoptic Apocalypse (xiii), a purposeful arrangement and interpretation of (partly Jewish) apocalyptic traditions, stresses that the church will have to continue Jesus' fight in history until the Second Coming and the final consummation. The first fruits of the victory are Jesus' Passion and death, and the church can only follow her master with fear and trembling into the ongoing battle (x, 32; xvi, 8). Despite the fact that the disciples were aware that, paradoxically, suffering was the victory, their behaviour during Jesus' Passion was complete failure (xiv, 27-31, 32-42, 50-52, 66-72). Thus Mark depicts Jesus' Passion and death as a continuing "scandal" for those to whom the secret of the Messiah already has been disclosed in the Resurrection (ix, 9; xvi, 1-8).

Literary History.—The last verse of the authentic text of Mark is xvi, 8. The verses that follow (9-20) in many Greek manuscripts and in almost all Bible translations are missing in some of the best manuscripts and are clearly a summary compiled later. Their originality already was doubted in the ancient church (Eusebius, Jerome). A shorter alternative ending contained in certain manuscripts is likewise spurious. Scholars are divided about whether the peculiar last sentence of the authentic text ("for they were afraid") was intended to be the original ending, whether Mark was perhaps prevented from completing the Gospel, or whether he wrote another ending that is now lost.

The related question, whether Mark is preserved in its original form at all, has led to several attempts either to reconstruct a Proto-Mark (*Urmarkus*) or to discover extensive written sources that provided the pattern and most of the material for the present Mark. Although none of these attempts has found wide acceptance, the problem of the "original Mark" admits to no facile solution. The hypothesis that the present Gospel is a Greek translation of an Aramaic original is to be rejected. Certainly it contains some Semitisms, often caused by the originally Aramaic traditions used by Mark; nor is its Greek style that of a well-educated Hellenist, since it contains many colloquialisms; but it cannot be doubted that its original language was Greek. It is equally sure that Matthew and Luke used a Greek text of Mark, although there is some evidence that their edition of Mark was not identical with ours. Neither Matthew nor Luke contains anything to correspond with Mark iv, 26-29; viii, 22-26; xiv, 51-52, and there are a few minor "common omissions" (e.g., Mark xi, 10a). Matthew and Luke also seem to preserve a more original wording in certain common synoptic pericopes. But if such instances suggest the existence of an "original Mark," it is also clear that it was only slightly different from the present text.

The questions of authorship, date and place of the Gospel are still debated. The use of Mark by Matthew and Luke establishes a date earlier than about A.D. 80. All attempts have failed to establish a close connection between the Neronian persecution (A.D. 64) or the Jewish War (A.D. 66-70) and the writing of Mark. A time shortly before A.D. 70, but certainly after Paul, would be possible, unless Mark xiii, 2, 14 is to be taken as "prophecy arising from the event" (i.e., formulated after the destruction of

the Temple in Jerusalem); if this is true, the years A.D. 70-80 would fit best. The earliest information about Mark is a presbyter tradition in Papias, bishop of Hierapolis (about A.D. 140, quoted by Eusebius in his *Church History*):

Mark, who had become the interpreter of Peter, wrote accurately the things said or done by the Lord, though not in the right order. For he had neither heard the Lord, nor had he been his follower, but later, as I said, he had followed Peter, who composed the teachings for his needs, but not as if making a composition of the sayings of the Lord. Therefore Mark committed no sin in writing certain things just as he remembered. For he had only one concern: to leave out nothing of what he had heard nor to include anything false.

Some consider this tradition to be a trustworthy indication of the Petrine basis (and perhaps also Roman origin) for the Gospel. But the picture of Peter traveling with an interpreter for his "courses of instruction" is as questionable as the suggestion that the "recollection of the Apostles" and their followers was the connecting link between Jesus and the written Gospels. Furthermore the statement about the disorder of Mark's Gospel is plainly wrong, and the role of Peter in the Gospel does not suggest the specifically Petrine origin of its material; nor does its character in general indicate that the Gospel was written by someone like Mark, who is mentioned in the New Testament as a personal companion of the Apostles (see MARK, SAINT). Papias' statement springs from a desire to establish the authorship of an Apostle, or at least of a direct follower, for certain writings used by the church, and is therefore not reliable. This leaves us almost completely in the dark about the author of Mark, and about the place of origin as well. That the *Shepherd of Hermas* (Rome A.D. 100-150) used Mark cannot be substantiated. It is not impossible that Justin knew it. But until Tatian, who composed a harmony of the four Gospels in Syriac (about A.D. 170), and Irenaeus, who values Mark as one of the four canonical Gospels, there is virtually no trace of Mark's being used, except in other Gospels (Matthew, Luke and the apocryphal Gospel of Peter). Later evidence comes from Rome, but this does not imply anything about the place of Mark's origin a century earlier (nor do Mark's Latinisms strengthen the argument for its Roman origin). It is just as reasonable to hold that Mark was written somewhere in the Greek-speaking church in the east (Syria or Asia Minor), where Matthew and Luke found and used it.

MARKET. The word "market" or some similar term derived from the Latin *mercatus* appears in most European languages and always refers to the place or method of contact between buyer and seller. The contact may be relatively simple, direct and personal, as in a market place, meat market or farmer's roadside market. It may be a highly organized institution such as those for securities, cotton or grain; or it may be concerned with factors of production rather than with products.

Early History.—Historically the word meant a place at which buyers and sellers met at set times to do business, under certain rules and regulations, in certain kinds of goods. Lack of markets is one sign of a primitive community. With a growth in specialized production and trade, it became necessary for buyers and sellers to meet together and markets thus became the nuclei around which towns developed. Markets held at long intervals, such as 3,

6, or 12 months, were called fairs. Business conducted by peddlers or in private retail stores or warehouses or by personal orders was not regarded as taking place in the market proper.

In ages when the volume of trade was small and transportation difficult it was helpful for sellers to know that if they took their wares to a certain spot on an appointed day they would find buyers gathered there. This knowledge centralized supply and demand, saved time and stimulated production for sale. Produce that became available only at certain seasons—wool, grain, cotton, furs, young livestock, etc.—could be disposed of at the end of the productive period in an annual fair. Commodities that were produced the year round—particularly perishable foodstuffs such as butter, cheese, eggs and fish—would need to be sold weekly at a market. Further, while a producer of seasonal commodities would not mind a long trip to a remote fair once a year, the seller of goods that were produced continuously needed some nearby market. He could not afford to spend more than one day a week taking his goods to market, selling them, buying what he required and then returning home.

While fairs were, therefore, located relatively far apart, markets had to be thickly sprinkled over settled areas. If, however, they became too numerous, the supply of goods or of buyers in each might be inadequate or uncertain, and the market-owner's income from tolls, stall dues and other charges would decline. During the rapid expansion of the western European economy in the 13th century the supply of markets seems to have outrun the demand to such an extent that strong efforts were made to prevent new ones from being set up wherever they might injure existing ones. Lawyers urged that markets should be at least two leagues (six miles) apart. This figure was probably quite reasonable and acceptable; it was near to the seven-mile radius which even in the early 19th century protected the markets in London from excessive competition; and it emphasized the essentially local character of the business transacted in the market.

Some markets remained general in character and were chiefly devoted to the exchange of farm produce for urban manufactures. John Ramsay M'Culloch, in his *Dictionary of Commerce and Commercial Navigation* (1835 edition), defined a market as "a public place in a city or town where provisions are sold." Producer and consumer met there face to face. Such contact was maintained not only in buildings or open spaces set aside for the purpose, but in the market squares of county towns and the so-called street markets of cities like London. If an area specialized in some staple product, however, middlemen would flock there to obtain their supplies for a wider national or foreign market. Classic illustrations of this condition were the cloth markets of Yorkshire and other textile areas. To them, small producers residing within a radius of not more than five or six miles brought their weekly output of one or two pieces of cloth and sold it to merchants, commission agents or factors. Held at first in a main street or market place for a fixed period of time on the regular market day, they were eventually transferred indoors when large "cloth halls" were built, often sponsored and financed by the merchants who bought the fabrics. Larger producers did not rely on such local outlets, but sent their wares in bulk to the central market at Blackwell hall in London.

Similar developments took place in many continental markets. In Bruges, Belg., for example, the large, open market place had by 1240 become flanked on one side by a *halle* in which cloth was sold on three days each week. By 1300 a second hall, the Waterhalle, was built astride a small river so that goods could easily be unloaded, and was open every day. A third hall, the Cruudhalle (Spice hall), appeared, to serve as market centre for Spanish wool, drugs, spices and other goods from the Mediterranean.

Legally a market was the property and source of income of the person on whose land it was held or to whom it had been granted. In feudal society subordinate landowners sought from their superiors the right to hold a fair or market; and in modern states the same rule may prevail, that the right has to be obtained from the government. The charter that granted the medieval franchise gave the owner power to collect tolls on goods sold—or even on all goods displayed—and fees for the use of stalls; it protected

his clients from competition by restricting sales in stores on market day; occasionally it conferred the right to operate a mint. In return it explicitly or by implication imposed the obligation to see that the "king's peace" or the "peace of God" prevailed and to preserve law and order in market transactions. This involved the provision of a market court to deal promptly with disputes concerning sales, disorder or violations of the regulations concerning weights and measures, price or quality. A clerk of the market had to be provided to approve all weights and measures, and a steward to preside over the court. Some markets passed eventually into the hands of the towns in which they were located; but private or corporate persons continued to seek permission to establish markets well into modern times, as for example the grant of Covent Garden market to the duke of Bedford in 1671.

Modern Trends.—In the late 18th and early 19th centuries many large towns arose, factories sprang up in many areas and commerce grew in volume. Wherever goods came to be made in factories by fewer, larger units, private buying and production-to-order bypassed cloth halls and similar markets; these therefore declined and were finally closed down.

On the other hand, the vast numbers of urban consumers could no longer deal directly with the rural food producers, especially where supplies came from a wider national or international area. With fast transport, bulk handling, refrigeration and the use of warehouses, goods could readily be moved and stored; but to conduct the attendant commercial transactions meant that many more men became intermediaries, such as agents and brokers, wholesalers and retailers. The pattern of distribution became at once more advanced and more complicated. Retailing in particular was transformed, as specialized shops increased in numbers and department stores developed in the late 19th century. Consumer retail markets declined in relative importance, but at the same time wholesale markets, including markets dealing in international products, became increasingly organized. The "extent of the market" as well as the variety of markets became a criterion of economic growth.

The processes of change were world-wide, but the chronology varied from country to country. The history of most expanding European cities in the early 19th century reveals the efforts made by private or civic enterprise to extend the accommodation for both wholesale and retail purchases. The five great London chartered markets—Billingsgate, Leadenhall, Smithfield, Spitalfields and Covent Garden—outgrew their local traditions and became national centres of distribution, but the local street markets survived. There were 15 Sunday morning street markets held in the middle of the 19th century. An attempt to replace East End street markets with a large new covered market (Columbia market) in 1869 failed to win popular support. In provincial cities the pattern of marketing changed considerably. For instance Leeds, a Yorkshire cloth centre, more than trebled its population between 1801 and 1851. In 1801 it had a weekly market for grain, cattle and hogs, and a twice-weekly one for cloth and provisions. By 1851 it had added a fortnightly fair for cattle and sheep and eight periodical leather fairs each year; it had removed the markets for provisions and livestock from the narrow main street, created a large open "free market" area for use by farmers and set up a meat market with an underground slaughterhouse. Meanwhile groups of investors had erected buildings for a bazaar, a meat and fish market, a central provision market, a corn exchange, leather fairs and a stock exchange. It was only in the later 19th century that a new "shopping area" reduced the relative importance of the consumer retail markets.

On the continent also, private and municipal markets were expanded as population became more dense. The construction of central markets (*halles centrales*) in Paris during the reign of Napoleon III was one of the most ambitious market undertakings. Napoleon I had been impressed by the congestion of the ancient market district and ordered the building of spacious new markets, but the expropriation and clearing of part of the site were the only accomplishments before 1815. The Parisian municipal authorities took up the matter again in the 1840s, but it was only when Napoleon III gave the project a first priority in his building program

that real progress was made. Work started in 1851 and eventually ten pavilions were completed, each with a light ironwork structure. Together the new central markets comprised an area of 21 ac., nearly half of it covered. Two more pavilions were added in the 1930s. The 19th-century Paris market buildings were models of their kind, serving the needs of both retailers and consumers. They were only one sign, however, of the initiative of Paris during this period. The city was also the first centre of the large department store. In most other parts of Europe the market remained the dominant retail centre.

In North America the European type of market developed naturally, rather than as the result of charter grants, to meet similar requirements, and in its simplest form can still be seen in operation in the market squares or halls of some of the older towns. The expectation of getting fresher or cheaper produce from a farmer still takes customers there in spite of the lavish array of retail stores. Of larger markets to supply retailers as well as consumers, the Fulton fish market in New York city or the Faneuil hall market in Boston are examples. Rapid urbanization and the rising cost of living after 1900 stimulated interest in efficient and economical marketing and led to considerable activity in providing city markets. Private businesses, especially the railroads, began to establish terminal markets at which country produce could be unloaded and displayed for sale. But in most of the public markets the customer is rarely the consumer. The spread of suburban stores and supermarkets, the extension of chain stores, the congestion of traffic around public markets, the production of branded consumer goods and the pull of advertising have all minimized the role of the public market in the system of distribution.

Retail markets are economic institutions geared to the economic life of societies that have not reached what is regarded in the 20th century as an advanced stage of economic and social development; they predominate in societies where alternative retail institutions are not well developed and where large numbers of people have relatively low incomes and plenty of time and are willing to haggle about prices. The best contemporary examples of traditional consumer markets are found in the middle east.

International commodity markets with wholesalers and brokers at the centre grew in importance in the 17th and 18th centuries, and during the 19th century became highly organized. Amsterdam was the first great modern international market centre, but during the 18th and 19th centuries London became the undisputed capital of international transactions both in money and in goods. For some commodities, notably cotton and wheat, a "futures" market was organized. The Liverpool Cotton exchange was the scene of regular and intricate dealings of this kind. In the case of many other commodities, such as wool, tobacco and tea, accurate grading is difficult at a distance and sales in those markets took place by auction on the basis of samples, or by private treaty. The organized produce markets themselves faced difficulties during the 20th century. Dislocation of international trade, caused by war or by economic depression, led to the development of bulk purchase and controlled trade and the emergence of separate economic blocs which sometimes bypassed the international markets altogether. Policies of international commodity control were advocated and in some instances pursued. The supremacy of London, particularly in the money and capital markets, was challenged, in some cases successfully. Nonetheless many of the markets survived and some of them took on a new lease of life after the middle of the 20th century.

Conceptions of "freedom" and "control" have influenced the history of markets during the 19th and 20th centuries. Free-trade arguments that were first applied to the market for commodities, particularly corn, were later extended to the land and labour markets, which some people argued should be as free as the rest. During the 20th century the "laws of the market," particularly of the "labour market," were deliberately set aside. In most instances this was part of national policy. Control, if not of the market, at least of particular markets or of particular aspects of the market, came to be regarded as a necessary, if still controversial, activity of government. See also EXHIBITIONS AND FAIRS.

(H. HEA; A. BRL)

ECONOMIC THEORY

In economics, the phrase "a market" refers to a set of interrelated buying and selling activities. The terms "buying" and "selling" are taken in their broadest senses. They include hiring, lending and forward trading (the present purchase and sale of a commodity to be delivered in the future). Economists speak of the labour market, the money market and the market for secondhand cars, as well as of markets for newly produced consumer goods. The existence of a market does not require the existence of a market place. The buyers and sellers of a commodity may never meet, and some of them never even see the commodity in which they deal, but they will still be described as trading in a market.

Market forms are distinguished according to the number of buyers and sellers, the degree of relevant knowledge they have, how easily additional traders can enter the market and how far the commodity dealt in is homogeneous. At one extreme is the perfectly competitive market in which there are so many buyers and sellers that none can singly influence the price of the commodity. Each of them takes price as given and determines what quantity he will buy or sell. It is assumed that all buyers and sellers are aware of any price quoted on the market and the costs of production of the commodity, that there are no hindrances to movement in or out of the market by buyers or sellers and that the commodity is homogeneous (all sellers offer identically the same product).

Examples of approximately perfectly competitive markets are the international markets in primary products such as wheat, wool, copper and tin, and those trading in a particular security on the stock market. The conditions for perfect competition are met reasonably well on a day-to-day basis: the commodities are homogeneous; as a rule no individual buyer or seller can exert a significant influence on price; and all buyers and sellers are in a position to know the prices at which trade takes place. Should one seller or group of sellers offer the commodity at a price below that being offered by sellers in a different part of the market, arbitrageurs will purchase from the former to sell to the customers of the latter; this arbitrage brings the prices quoted in the two sections of the market into line.

Opposed to perfect competition is the market form of monopoly, where there is only one seller and no others can enter the market. The pure monopolist assumes that the quantity of his commodity that he can sell depends on the price he charges; the lower the price the more he can sell, and he selects the price at which his profits are greatest. No actual monopoly is ever quite pure, although the granting of patents and other state-conferred rights may temporarily produce a market form which closely resembles pure monopoly.

What often develops in practice is the mixed case of monopolistic or imperfect competition. In this, each firm's product is recognizable as its own; i.e., there is differentiation of product; the firm may be said to have a monopoly in it. But there are many firms producing very similar products, so that together they form a market which is competitive. In such markets firms do not compete solely by price variation. Advertising, brand names, changes in quality and the provision of ancillary services are all recognized and used as means of increasing sales and profits. But the threat of potential competitors ensures that the rate of profits does not rise to an abnormally high level: if it does, new firms will be attracted into the market, bidding away customers and thus making existing firms less profitable. A great many markets are of this last type, particularly in retailing and in the making of consumer goods, where firms possess the consumer's "good will"; they may thus raise prices without losing all their customers.

A valuable distinction is made between those markets in which firms do not take account of other firms' behaviour and those in which they do. The latter are called oligopolistic. Each firm in an oligopoly must consider whether raising the price of its goods will cause another firm to follow suit. There is interdependence between firms; none can determine the outcome of its own actions without taking account of possible reactions by other firms.

Price competition in oligopoly often leads to unstable situations in which prices fluctuate considerably. But generally the market

tends to settle down, and competition occurs mostly through those nonprice variables that mark monopolistic competition.

Instead of firms fixing their own price, they may all follow the price quoted by a leading firm—perhaps the largest one in the industry, which thus exercises price leadership. Collusive or restrictive behaviour occurs where oligopolistic firms disliking the results of competition agree formally or informally to outlaw certain practices. They may come to some arrangement every year as to the prices to be quoted, the discount to be given for exceptionally large purchases and even how the market is to be split up among themselves. To maintain such practices, especially those connected with market shares, it is necessary to exclude potential competitors. This may happen naturally because of the great costs of entering the market on the supply side; otherwise the existing firms may devise schemes specifically preventing new competition. Thus, the oligopolists try to transform the market into a monopolistic one.

Interdependence makes most actual markets oligopolistic. Typical examples are the steel, chemical and motor industries, in which the number of firms is small. All these market forms depend on the various conditions of supply and entry, but not on possible differences on the demand side. But corresponding to monopoly and oligopoly, there are also markets with a single buyer (monopsony) and few buyers, each reacting to the others (oligopsony). These may be combined with their supply counterparts to produce such market forms as bilateral monopoly, one buyer facing one seller, and bilateral oligopoly, few buyers and few sellers. They are of special interest because within them occurs an important type of behaviour, namely bargaining, with its related phenomena—threats, reserve strength, arbitration and the maintenance of secrecy. The chief example is the labour market in which wage rates and conditions of work are determined collectively by trade unions and associations of employers. Prices, quantities and quality are not fixed solely by the forces of demand and supply: equally important are negotiating ability and the ability to withstand a failure to agree.

So far no account has been taken of dynamic aspects. Since decisions take time to work themselves out, a situation may in the short run be best described in terms of one market form, whereas in the long run it may correspond to an entirely different one. For example, if there is free entry, but it takes a long time for new competitors to appear, from the short run point of view this may be an oligopolistic market, but given time for adjustments to take place, a monopolistic competitive one.

MARKET GARDENING: see HORTICULTURE.

MARKET HARBOROUGH, a manufacturing and market town and urban district of Leicestershire, Eng., on the Welland river, 15 mi. S.E. of Leicester by road. Pop. (1961) 11,535. The church of St. Dionysius (c. 1250) has a very fine broach spire. The Robert Smyth's grammar school, founded in 1614, occupies modern buildings, but the original half-timbered building, raised upon pillars of wood, remains. Industries include rubber, textile goods, corsets, light engineering, patent foods, accumulators (storage batteries) and shoe heels. As the market town for a large agricultural area, the cattle and general markets have been held on Tuesdays since about 1200. Market Harborough is a famous fox-

hunting centre. Dingley hall (2½ mi. E.) is Elizabethan and later and has a fine gatehouse.

MARKET INDEX, a term used in marketing and economics with two different meanings. In one sense, it refers to a statistical indicator of business activity in one or more industries. The Dow-Jones daily average of the prices of 30 selected industrial stocks and Standard & Poor's 500-stock composite index are the leading examples of indexes of stock-market activity. Similarly, the Federal Reserve index of industrial production can be interpreted as a market index of activity in U.S. mines and factories. Electric power output, regional income estimates, expenditures on new construction and life insurance sales are further examples of market indexes in this sense.

In its second and more restricted sense, a market index measures the actual or potential capacity of the population, or a segment thereof, to buy an article or service offered for sale. Some market indexes limit the scope of the term in this sense to the allocation of sales among territories, in which case the market index becomes a series of percentages, each estimating the proportion of total sales that should be made in a particular region. Others, however, extend the term to cover forecasting of total sales, thereby using it more or less synonymously with "sales forecast" and "sales potential."

In some cases, a single indicator, such as retail sales, or a general index, such as the *Sales Management* estimates of effective buying income, is considered sufficiently representative of product sales to be used as the "specific" market index for the product. More often than not, however, the specific market index is derived as a composite of the main factors believed to affect sales of the product. These may include variables measuring national business conditions, as well as those of industry, and even company, factors.

There are at least two main methods of determining the index in such a case. One method involves modifying actual sales figures on the basis of a rule-of-thumb judgment (sometimes supplemented by field surveys) as to the effect and relative importance of other factors (population, prices, sales of competing products, etc.) and deriving forecasts by extrapolation. The other method seeks to derive an equation reflecting the numerical effect of each of the main relevant variables on product sales. Thus, the sales of Company Y's gas refrigerators in a given year may be found to depend on national income in that year, availability of natural gas, number of families, number of salesmen representing the company and the company's advertising expenditure. With the aid of statistical (correlation) analysis, an equation can be set up reflecting the extent to which these variables affect sales. Sales estimates or regional sales allocations for a future period are then obtained by making assumptions as to the probable values of these variables in that period and substituting these values in the equation. The application of this method has been facilitated considerably by the advent of electronic computers.

Whatever the method used, the result provides an index of the possible (or potential) market for the product and thereby aids the firm in evaluating past operations and in planning future operations. It enables sales quotas to be set by territories and predictions to be made of the effect on sales of such changes as a 10% increase in advertising expenditure or a given percentage rise in population.

A market index is usually reliable only as a measure of past performance, and often possesses major limitations even in this sense. Experience shows that market indexes are more accurate in estimating territorial distribution of sales than in forecasting their total amount. Their use as a forecasting tool is invariably predicated on the implicit extrapolation of past relationships into the future. Faulty judgment regarding the future course of the variables incorporated in the market index is another serious source of error in forecasting. Over-all market forecasts tend to be most accurate when product sales continue in the same direction as in the recent past, but are likely to err considerably when business activity changes direction. See also ECONOMIC FORECAST.

MARKETING. The meaning of the term "marketing" has broadened considerably in the 20th century. It is now generally understood to comprise all the activities involved in the movement of goods from producers to final consumers. It often includes some initial processing, but not treatments which change radically the nature of the product. For some products there may be several phases of marketing, as, for example, when metal is first offered for sale as such and later again comes on the market as machinery, or when cotton is first offered raw in bales, then as spun yarn, later as cloth and finally as a shirt.

There are narrower senses of the term "marketing." To housewives in the United States it may mean only shopping for food, whereas some businessmen use it to mean the specific technique of selling their products. Such usages reflect aspects of marketing with which particular groups are especially concerned.

Historical Development.—In subsistence societies each individual or family unit collects, harvests or hunts what it needs for a livelihood and there is little exchange. Markets appeared first as meetings for bartering such products as skins, fruit and metals which were available in one locality for others, such as salt and textiles, which could only be obtained elsewhere; then at places where sales were made regularly for cash. Under the Roman civilization the *mercatus*—a public place where sellers and buyers met—was a common institution. (See MARKET.) With the growth of specialized artisans and of industrialization, and thus of the proportion of the population not producing its own food, professional intermediaries became necessary to bridge the gap between the food producers and nonagricultural consumers. By the second century A.D. firms specializing in the overseas purchase, shipment and wholesale distribution of grain, oil and fish had been established in Ostia, one of the ports of Rome, and large commercial warehouses had been built. With the decline of Rome and the deterioration in conditions of transport, long-range marketing operations contracted. Characteristic of the middle ages was the city supplied from the surrounding countryside; long-distance marketing was confined largely to valuable textiles and artisan ware which changed hands at centres such as Samarkand on the silk road from China to the middle east. The discovery of the sea route to the East Indies stimulated the development of extended marketing channels for sugar and other tropical products. With the Industrial Revolution came large-scale marketing of basic foodstuffs and of raw materials like cotton. In the marketing of food the 20th-century trend is toward leaving almost all of its preparation to specialized agencies which undertake it in bulk. An increasingly large proportion of the food that consumers buy is ready to eat or has only to be warmed.

Importance of Marketing.—In advanced economies where most of the population is engaged in specialized production of goods of which they themselves can use only a small part, marketing is a key activity. The modern farmer as well as the manufacturer could not manage without it. The marketing system makes possible sales for cash. The farmer can then buy improved seed, fertilizers, pesticides and machinery, and so obtain higher yields per man and per acre. The manufacturer can purchase materials from a wide range of sources. Both farmer and manufacturer can pay their workers in cash instead of in kind.

Consumers concentrated in urban centres, where they produce no food themselves, depend on marketing for survival; food must be brought to them. If the marketing channels were interrupted—as seemed likely for some cities during World War II—then many millions of people would be without food. Thus specialization, industrialization and urban concentration are associated with organized marketing, and rapid economic development is conditional upon a comparable growth of marketing functions and services.

Nature of Marketing.—The tasks involved in effective marketing are determined by the character of the product, the requirements of processor-buyers and consumers, and local conditions.

Assembly.—The assembly of produce of differing type and quality from a number of sources is usually the first step in marketing.

Concentration at convenient points attracts buyers who could not spare the time to visit scattered producers; it permits transport, storage, grading, packing and processing on a larger scale and with more specialized techniques.

Most products undergo substantial changes before they are ready for the final purchaser. For example, grain is ground into flour and baked into bread; animals are slaughtered and divided into convenient meat cuts and by-products; milk is converted into butter and cheese. Some initial processing is undertaken, not because consumers seek it directly, but because it is necessary for the conservation of quality. For instance, perishable fruit and vegetables surplus to immediate demand, or intended for consumption outside the normal harvesting seasons, must be canned, dried or frozen. Savings in cost and advantages in merchandizing accruing from large-scale operation have favoured the development of very large assembling-processing-wholesaling enterprises dealing with food. A few such firms based in the United States and western Europe handle a very large proportion of the trade in vegetable oils, meat, milk, canned and frozen fruit and vegetables, prepared soup and baked goods.

Distribution.—Distribution systems develop to match available supplies to consumer demand. Supplies flowing into assembly points and warehouses fluctuate in type, quantity and quality. Consumer demand may also vary according to season, climate, religious teaching, local customs and many other factors. Distributors adapt the flow of supplies to such variations in demand by using their experience and market intercommunication. The wholesalers' work may terminate with the provision of supplies in appropriate quality and quantity for use in mills and manufacturing plants, or it may proceed to the splitting up of loads into retail quantities suitable for sale to individual consumers at local shops.

In North America and western Europe increasing concentration of management has long been a feature of retail distribution of food, clothing, pharmaceutical products and low-priced variety goods. Three food chains in the United States operated about 9,000 retail outlets in the early 1960s with total sales of about \$10,000,000,000 annually. Five companies sold two-fifths of the food retailed in Canada. In most western European countries there were two or three retailing enterprises with at least one outlet in every large town. The retail co-operatives which accounted for more than one-fifth of the food trade in Britain obtained most of their supplies through a single co-operative wholesale society. To compete with the large chains and co-operatives in obtaining quantity discounts from manufacturers and other wholesale suppliers, many independent retailers had joined voluntary buying groups. One such group had about 225 wholesale and 30,000 retail members in Britain, the Netherlands and other western European countries.

Transportation.—Movement of products between places is an essential part of marketing. Transport to railheads, ports or processing plants may be provided by either the original producer or the first buyer. Longer-distance movement by road, rail or sea is often furnished by specialized transport firms. Delivery to the retail outlet may be part of the wholesale service. The last transport phase between the retail shop and the consumer's home may be arranged by the retailer, but more generally is left to the consumer.

Many products require transportation of an extremely specialized kind. The movement of fruit, vegetables and milk calls for prompt and careful handling and, perhaps, for refrigeration en route. Many of the disadvantages and much of the strength of different marketing systems have their origin in transport methods. If deliveries are slow, and equipment is inadequate, products deteriorate before reaching their market, and contracts cannot be met. Careless handling and delays can result in serious damage and loss, and impose heavy costs on that part of the load which does reach the market in sound condition.

Storage.—Storage facilities are needed at various stages of the marketing sequence. Most traders who take possession of produce also control storage facilities in order to have freedom of choice as to the time of resale. Processing plants hold reserve stocks of their raw materials in store so that their machinery and

staff are not held up by delays in the arrival of new supplies. At ports and other transshipment centres, and near important commodity markets, storage is provided by specialized enterprises and made available for a fee. Wholesalers and retailers also maintain storage to hold stocks from which they can satisfy clients' requests promptly.

Grading.—Grading products according to recognized uniform standards enables buyers to purchase more precisely what they want and are willing to pay for; to this extent it increases their satisfaction and makes the marketing system more efficient. Where buyer and seller are separated by long distances, as in much export marketing, personal inspection of individual lots is impracticable. The risks, delays and disputes involved in trading without it have led to the drawing up of standard quality specifications and contracts. Often this was undertaken first by associations of interested private traders such as the London Grain Trade association. Later, governments established detailed specifications. For shell eggs in the United States there are separate official quality, grade and weight specifications for government procurement, wholesale and retail transactions respectively.

Packaging.—Most food and manufactured products must be enclosed in some kind of container if they are to be marketed widely and efficiently. These containers afford a convenient way of handling, help to prevent physical deterioration, make theft, adulteration or substitution more difficult, ensure cleanliness, and facilitate measurement, labeling and the attachment of sales instructions and descriptions. They may also promote sales because of their attractive appearance. Specialized equipment and enterprises have been developed to pack goods in wood, metal, paperboard or plastic containers adapted to a wide range of requirements.

Exchange.—An essential part of marketing is the bringing together of buyer and seller and the facilitation of exchange. Two phases are involved: the contacting of possible buyers and sellers of particular products at a given time, and the negotiation of the terms of exchange. In many countries the town market square is the scene of a steady flow of direct transactions between producers and consumers. There each producer accepts full responsibility for advertising his produce, finding customers and obtaining information to guide him in bargaining over the price.

In larger markets, and where producers and consumers are separated by distance, time and processing requirements, the negotiation of sales may be undertaken in return for a fee by specialized commission agents, brokers and auctioneers who, perhaps, neither take possession of nor handle the goods sold. Accurate information on the character and quality of a product, its suitability for various purposes and its price in alternative markets is important for persons engaged in buying and selling. Advertising and market news reporting by specialized circulars, press and radio provide this. Special reporting services designed to supplement such information and help consumers buy to the best advantage had acquired great influence in the United States and Britain by the 1960s.

Finance and Risk.—All marketing requires finance. The owner of goods at any stage must either sacrifice the opportunity to use his own capital elsewhere or borrow the necessary capital from some other source. Farmers, wholesalers, manufacturers and retailers need capital or credit for the time during which they are in possession of products and are awaiting sale and payment. Wholesalers, for example, must finance their packing, processing and storage plants, transport equipment and display premises. Retailers must also finance their sales premises, that part of their stock which wholesalers do not carry and, in trades like that for consumer durables, a large proportion of their customers' purchases.

Risk bearing is also involved in marketing and must be covered by an equivalent expectation of profit. One of the major risks is that of a fall in price. Price variations are greater for agricultural products, which are subject to the impact of drought, rain and frost, than for many other traded commodities. The risks of such changes for individual traders are often minimized by resort to organized commodity exchanges, where "futures" may be bought and sold as a hedge against cash transactions. Risks of quality deterioration are very important in the case of perishable products

such as milk and some fruits and vegetables.

Service.—Generally, the services offered by the marketing system tend to rise with the ability and willingness of the consumer to pay for them. With the relative increase in labour costs at retail establishments, however, there has been a marked trend toward the adoption of self-service sales methods for food retailing. In the early 1960s most groceries in the United States, and between one-third and one-half in northwestern Europe, were sold by self-service. Discount stores, which offer a minimum of sales and after-sales services, were becoming a potent influence in the retailing of consumer durables.

Marketing Margins.—The marketing "margin" is the difference between the price paid to the first seller and that paid by the final buyer. It is usually a composite of the margins obtained by the wholesalers and retailers involved, together with specific charges for such services as transport, storage and finding a buyer. The former are determined by competition in buying and selling; transport charges are usually at a flat rate according to the quantity handled, whereas sales commissions are an agreed percentage of the price obtained. The size of the marketing margin varies with the commodity and the conditions of marketing. Influential factors include the length and complication of the marketing channel, the wastage and risk involved, and the presentation and other services provided. The average margin between the farm value and the cost to the consumer of major foods (expressed as a rough percentage of the retail price) in the United States in the early 1960s was: for eggs and poultry 40%; meat 50%; dairy products 55%; fruits and vegetables 70%. Of an average 70 cents charged by New York retailers for one dozen large eggs it was estimated that 15 cents went to the retailer, 9 cents represented wholesaler's costs and margins, and 7 cents covered such costs as packing and transport between farmer and wholesaler. It was generally true that marketing margins tended to rise as consumers bought more elaborately packed and finished products. However, the cost to the consumer of the so-called "convenience foods"—canned, frozen or ready-mixed—marketed in the United States averaged less than that of the comparable fresh products. Moreover, while marketing margins tend to widen in the economically most-developed countries, returns to the grower also rise because he becomes more specialized.

Improvements in Marketing.—In many countries the main improvements in marketing spring from the enterprise of private traders and corporate firms seeking business profit. Competition induces them to devise cheaper and more effective handling methods and to build more economical plants, and, where it is strong, ensures that producers and consumers benefit through the competitive cutting of margins.

Marketing improvements also stem from the joint action of individuals or firms concerned in the marketing of a particular product or combination of products. This type of group action may be voluntary, as where a number of farmers or consumers join together in a co-operative to provide marketing facilities more economically or to increase their bargaining power. On the other hand, it may involve some compulsion when the effectiveness of a scheme is dependent upon participation by all concerned; levies and restraints are then imposed on individuals who might be tempted to sell independently of the scheme. This has led to the development of marketing boards and orders, whereby a government delegates authority to a specified board or commission to require producers and handlers of a commodity to observe certain rules and procedures; in some countries such a board assumes full responsibility for marketing certain products, buying and selling with its own staff or through private firms and co-operatives acting as its agents. (See MARKETING BOARDS AND ORDERS.)

In most countries the need for governments to help in the improvement of marketing is now recognized. Three major types of improvement measures can be distinguished:

1. Regulatory; e.g., the standardization of weights, measures and containers; the establishment of minimum health standards; quality inspection and certification programs to permit sale by description; and the regulation of transport, storage and public market facilities to ensure fair practices.

2. Facilitating; e.g., the provision of market information; the setting up of training and extension services; and the financing of research to raise the efficiency and reduce the cost of marketing. After the passing of the Agricultural Marketing act of 1946 the U.S. government made available about \$10,000,000 annually for research on the improvement of agricultural marketing.

3. Direct intervention; i.e., government entry into the purchase, sale, storage and movement of commodities in order to influence their pricing, supplement existing market channels and increase competition, or to protect producers and consumers against emergency pressures or chronic weaknesses in the working of a marketing system.

In western European countries and in the United States, concern to maintain domestic output of essential commodities such as wheat and basic metals, and the pressure of political influences have led governments to assume continuing price-fixing, stockpiling and subsidization responsibilities.

Sharp fluctuations in prices of commodities traded extensively between countries and the consequent adverse effect upon producers and consumers have inspired a number of attempts to stabilize prices on an international level. For some commodities, exporting countries with a major share of the world market have tried to control marketed supplies unilaterally, as Brazil has done for coffee. For others like wheat, sugar and tin the major export producers have joined forces to set limits to the range of prices at which sales would be made, assign export quotas or set up a buffer-stock authority to stabilize prices by market operations. (See STABILIZATION AGREEMENTS, INTERNATIONAL.)

MARKETING BOARDS AND ORDERS. Marketing boards were set up originally in Great Britain and other commonwealth countries, including Australia and Canada, to help solve specific problems growing out of the depression of the 1930s. A comparable development in the United States was the marketing order, employed notably in California for certain fruit and vegetable crops and throughout the country for milk. The powers given under marketing board legislation and marketing orders range from authority to make a levy for the support of advisory and promotional services to full control over output and sales of specified products. Once established, statutory marketing boards usually operate independently of the government, which, however, generally retains some control over their decisions. The California marketing orders are operated by the state director of agriculture with the assistance of a board appointed under the order.

The simplest type of board is one established to carry out market research, promote sales and furnish information. It may undertake pilot programs to develop new uses and outlets; it may advise on varieties, packing and grade standards; and it may conduct quality analyses and arbitrate disputes. To finance its operation a small fee is levied on all sales of the products concerned. Sales promotion is a main activity under the California marketing orders; for example, \$1,700,000 was spent on wine promotion alone in 1960-61.

Other examples are the Australian federal marketing boards, the National Coffee Board of Ethiopia, the Ceylon Tea Propa-

ganda board and the Rhodesian Tobacco Export Promotion council.

A marketing board may be empowered to regulate terms and conditions of sale. Usually it establishes obligatory quality and packing standards for sale to certain markets, sets up laboratories for quality analyses and perhaps some processing installations, and engages an inspectorate. Such a board is frequently set up to maintain the reputation of a particular country in foreign markets; the high reputation of eggs exported from the Netherlands is due in part to that country's inspection system.

The prime motive in the establishment of some marketing boards is to stabilize producer prices. Such a board often negotiates prices with large processors, wholesale buyers and distributors on behalf of producers and/or consumers, as in Canada for various fruits and vegetables and in Britain for hops. The board may also control the area of production or the supplies put on specific markets in specified forms at specified dates, or assure certain guaranteed prices for a given volume of output, leaving additional output to find its own market. This may involve individual registration of producers and handlers and reporting of sales, especially if prices for specific quantities are supplemented.

This type of marketing board or order is often used for products whose perishability requires that sure outlets be established in advance. In the case of milk the board undertakes to assure consumers a regular supply of the fluid product, and to pool returns to farmers from sales both in this market and at lower prices to manufacturers. The fluid consumption and manufacturing markets must be kept separate by means of a control system or else fluid milk consumers will buy the milk offered for manufacture. A marketing board can maintain such a system by refusing supplies to any distributor who sells milk for domestic consumption at less than an agreed price. Milk not sold at this price is sold to manufacturers for whatever it will bring. Total receipts from both markets are then divided by the quantity sold to give an average price per unit sold and are distributed to individual suppliers accordingly. In the mid-1960s there were more than 80 federal milk marketing orders for specific U.S. city or regional market areas. There was one milk marketing board for England and Wales.

Another way in which this type of group marketing control can stabilize and raise average prices is through the manipulation of market flows. The objective of flow control programs is to adjust deliveries between different seasons or outlets in such a way as to maintain reasonably high levels of demand in all the markets at all times. Generally, an average price target is set for each outlet on the basis of experience in the preceding season. Sales are then expanded or contracted in order to avoid flooding the market at any one time or place and thus reducing the price below the target. These adjustments can be arranged through a marketing board with power to allocate markets to particular producers and limit the quantities delivered. This approach is characteristic of the marketing programs for fruits, vegetables and nuts in California. Such group control over sales in order to improve returns for agricultural production is comparable to the policies employed by large industrial manufacturers.

Where group determination of the sales made by individual producers and handlers is administratively difficult other approaches to stabilization have been tried. In the middle east and Latin America, marketing boards and branches of public banks or development institutes were set up and furnished with capital to purchase basic grains, maintain buffer stocks and sell on open domestic markets alongside other traders. The objective was to increase incentives to producers by buying to maintain a minimum price, and to protect lower-income consumers by selling from stocks when rising prices were likely to cause hardship. Such a board, using a buffer stock to stabilize supplies and prices within and between seasons, must have its own storage and marketing equipment and must also be able to control imports and exports of the commodities concerned. Usually publication of the price at which it will buy is enough to induce other market channels to offer comparable terms; consequently the board does not have to take up a large part of the total crop marketed. The buying points must, however, be sufficiently widely distributed to be within reach of most farmers.

Where a product is designed primarily for export markets, domestic producers can be protected from the effects of the more violent fluctuations in world prices by means of stabilization funds. This approach was employed by the marketing boards set up after World War II in the Gold Coast (now Ghana), the Federation of Nigeria and Sierra Leone to stabilize prices paid for cocoa, peanut and palm-oil exports. A reserve fund is accumulated when export prices are high and is drawn upon to maintain prices to farmers when they are low. To carry out such a program, marketing boards in these countries were granted a monopoly of all export sales. Domestic purchases are made through licensed agents and the board's own buying stations. Export sales are made directly by the board or through brokers on major international markets. In many of the French-speaking African countries the goal of price stabilization was approached by means of a reserve fund to which private exporters contribute when export prices are high and upon which they draw when export prices are low. A major problem with these schemes is to maintain an adequate reserve fund under pressure from producer and other interests to disburse it.

Sometimes boards are also granted a marketing monopoly for certain produce in specified areas or market channels in return for providing agreed marketing and processing facilities. Usually this is done when the investment required is considerable and the volume of produce to be handled is only enough to support one such enterprise on an economical scale. The Kenya Meat commission and the Cold Storage commission in Southern Rhodesia occupy such positions. See also STABILIZATION AGREEMENTS, INTERNATIONAL.

MARKHAM, SIR CLEMENTS ROBERT (1830–1916), English geographer and historian whose travels, writings and patronage stimulated geographical exploration and education, was born on July 20, 1830, at Stillingfleet near York. Educated at Westminster school, he joined the Royal Navy in 1844 and accompanied the Franklin search expedition to the arctic in 1850–51. On leaving the navy in 1852 he traveled in Peru and the eastern Andes. The following year he entered the civil service, joining the board of the East India company in 1854. In 1860 he revisited South America to arrange the introduction of the cinchona plant, the source of quinine, into India and later visited the cinchona plantations of both India and Ceylon. From 1867 to 1877 he was geographical adviser to the India office in London and as such a strong supporter of the surveys being carried out in India; he was also geographical adviser on the Abyssinian campaign of 1867–68. In 1875 he went to the arctic under Sir George Nares.

Markham was elected a fellow of the Royal society in 1873; he was secretary of the Hakluyt society 1858–87, and its president 1889–1900, secretary of the Royal Geographical society 1863–88 and its president 1893–1905; president of the International Geographical congress, held in London in 1895; and it was through his personal efforts that funds were raised for Captain R. F. Scott's National Antarctic expedition in 1901. From 1872–78 he edited the *Geographical Magazine* (later the *Proceedings of the Royal Geographical Society*, and now the *Geographical Journal*) and wrote extensively in these periodicals as well as works for the Hakluyt society, many of which were translations with learned commentaries. He also wrote *Life of Robert Fairfax* (1885), *A Life of John Davis, the Navigator* (1889), *Life of Christopher Columbus* (1889) and *Major James Rennell and the Rise of Modern English Geography* (1895). He died in London on Jan. 30, 1916. (K. M.)

MARKHAM, EDWIN (originally CHARLES EDWARD ANSON MARKHAM) (1852–1940), U.S. poet, author of "The Man With the Hoe," was born in Oregon City, Ore., on April 23, 1852, the youngest son of pioneer parents. He grew to manhood on an iso-

lated valley ranch in the Suisun hills in central California attended the California State Normal school at San Jose and later graduated from the Christian college at Santa Rosa. He subsequently became a high-school principal and superintendent at various places, and finally headmaster at the Tompkins Observatory in Oakland, connected with the University of California. Markham abandoned school administration in 1899, after his poetry had gained favour, and devoted himself to writing and lecturing. In the same year he gained national fame with the publication in the *San Francisco Examiner* of "The Man With the Hoe," his most famous known poem. Inspired by Millet's painting, Markham made the French peasant the symbol of the exploited classes throughout the world. The poem so well expressed the economic and social conditions of the time that it was reprinted in nearly every newspaper in the country and was the subject of wide editorial comment. His book of verse, *The Man With the Hoe and Other Poems*, which was followed in 1901 by *Lincoln and Other Poems*, the distinctive title piece of which found almost as much favour as "The Man With the Hoe." His succeeding volumes—*Shoes of Happiness* (1915), *Gates of Paradise* (1920), *New Poems: Eighty Sonnets* (1932) and *The Star of Araby* (1937)—have the grand manding rhetoric but lack the passion of the early works. On March 7, 1940, Markham died at Staten Island, N.Y., where he had made his home since 1901.

BIBLIOGRAPHY.—W. L. Stidger, *Edwin Markham* (1933) and an article by G. R. Grose in the *Personalist* (1936). A useful collection of Markham's writings may be found in S. Shields, *Edwin Markham: A Biography* (1953).

MARKHAM, GERVASE (JERVIS) (1568?–1637), English poet and author of a number of popular treatises on country sports and pursuits, was born c. 1568, the third son of Robert Markham of Cotham, Nottinghamshire. Nothing certain is known of his early life, but he may have been brought up in the estate of Rutland's household and probably went to Cambridge university. He wrote of himself, "a piece of my life was Scholar, a piece Souldiour, and all Horseman." His brilliant reputation as a poet and his expert knowledge of the care and training of horses were reflected in his first surviving printed work, *A Discourse of Horsemanshippe* (1593), and in *Markham's Masterpeece* (1610), a popular manual on diseases of the horse and their treatment. As a soldier he traveled widely, serving in the Low Countries and in the Irish campaign of 1599, when he was probably attached to the earl of Southampton's company, and his military experience enabled him to write on the composition and training of the army.

He was a member of the earl of Essex' circle, to other members of which some of his poems, including *The Most Honorable Legend of Sir Richard Grimvile, Knight* (1595), *The Poem of the Earl of Essex* (1596) and *Devoreux* (1597), were dedicated. His religious poems, *The Teares of the Beloved* (1600) and *Marie Magdalens Lamentations* (1601) are thought to contain disguised references to the betrayal and fall of the earl of Essex. Essex is also commemorated in Markham's *Honour in His Perfection* (1624), the lives of the earls of Oxford, Southampton, Essex and Lindsay. Markham wrote two plays, *The Dumb Knight* (1608) and *The True Tragedy of Herod and Antipater* (1622), which before performance were revised by collaborators, and *The English Arcadia* (part I, 1613), a novel in the convention of Sir Philip Sidney's *Arcadia*. He was a minor poet with a few fine passages. His association with the Essex group has led Robert Gittings to suggest in *Shakespeare's Rival* (1960) that he might be the rival referred to in Shakespeare's sonnets. With the decline of the country, Markham was forced to take up farming, which provided material for more treatises. He married c. 1595, is known to have had many children and probably spent his last years in poverty in London. His name occurs in the burial register of St. Giles parish, London, on Feb. 3, 1637.

MARKHOR ("snake-eater"), a large Himalayan wild goat (*Capra falconeri*) characterized by its spirally twisted horns and long shaggy, grayish winter coat. From the mountains of Kashmir the region of the markhor extends westward into Afghanistan. Markhors generally live beneath the timber line. The twist of the horns varies locally. The largest form may stand more than

high at the shoulders and weigh more than 200 lb.

MARKO KRALJEVIC (c. 1335–1395), Serbian king and national hero, was the son of King Vukasin. He became a Turkish vassal after his father's death in the battle with the Turks on the Maritsa river in 1371. He completed the church that his father had begun at Susica near Skopje; it is known as "Marko's monastery." His silver coins had the inscription: "In Christ God the king Marko." There is a well-preserved portrait of him in the church of the Holy Archangel at Prilep.

Marko was killed in the battle at Rovine, on May 17, 1395, in the Turkish expedition against the Walachian prince Mircea the Old.

Tradition and folk songs furnish many more details about Marko, who is always called Kraljevic (the king's son). He became the greatest Serbian hero, sometimes gay, but always just. Many of the stories connected with him are fabulous and some have been transplanted from older literatures. He is praised also in Bulgarian, Rumanian and Albanian folk songs. The oldest poem about him dates from the middle of the 16th century.

MARKOV, ANDREI ANDREEVICH (1856–1922), Russian mathematician, was the first to give a complete and strict proof of the so-called central limit theorem. Markov passed through the academic grades at the University of St. Petersburg; he was appointed ordinary professor in 1886 and ordinary member of the Academy of Sciences in 1896. The earlier part of his work was devoted to number theory and analysis, notably to continued fractions, the limits of integrals, the approximation theory and the convergence of series. From about 1900, he was mainly occupied with probability theory. Under fairly general assumptions, he proved the central limit theorem, which states the asymptotically normal (Gaussian) distribution of the sum of a large number of independent random variables. Markov then turned to study mutually dependent variables, introducing the important notion of chained events (Markov chains). A sequence x_1, x_2, \dots , of mutually dependent random variables constitutes a Markov chain if, roughly speaking, any prediction about x_{n+1} , ..., knowing x_1, \dots, x_n , may without loss be based on x_n alone. He extended several classical results concerning independent events to certain types of chains. Markov's work is one of the starting points of the modern theory of stochastic processes. A selection of Markov's works in number theory and probability theory, including a biography and a bibliography, was published in Moscow (1951).

See E. B. Dynkin, *Theory of Markov Processes* (1961). (G. Eo.)

MARKOVA, ALICIA (DAME ALICIA MARKS) (1910–), English ballerina noted for the ethereal lightness and poetic quality of her interpretations of *Giselle*, *Les Sylphides*, *Swan Lake* and other ballets. Born in London, Dec. 1, 1910, she studied with Ekphima Astafieva and Enrico Cecchetti. Phenomenally gifted, she made her debut with the Diaghilev Ballet at 14, and was soon playing leading roles. Alicia Markova has appeared as ballerina in Ballet Rambert, Sadler's Wells Ballet, Ballet Russe de Monte Carlo, Ballet Theatre, and as guest artist with the Metropolitan Opera. With Anton Dolin, she headed the Markova-Dolin Ballet (1935–38) and Festival Ballet (1949–52). She was created dame of the British empire in 1963. (L.N. Mz.)

MARKOVIĆ, SVETOZAR (1846–1875), Serbian political writer whom the Yugoslav Communists claim as their precursor. Born on Sept. 21 (new style; 9, old style), 1846. He studied in Belgrade in St. Petersburg, where he fell under N. G. Chernyshkov's influence, and in Zürich, where he fell under the influence of Karl Marx. A member of the Socialist International, he began his political career by editing the first Serbian Socialist newspaper, *Radnik* ("The Worker"; 1871), which was more concerned with economics than with politics. Persecuted by the Serbian government, Marković fled to Hungary (1872), but soon returned to edit *Kragujevac* the newspaper *Yavnost* ("Public Opinion"; 1873), which set aside economics to deal more with politics, and then

Glas Yavnosti ("The Voice of Public Opinion"; 1874). He denounced bureaucracy, professional judges and written laws and advocated the sovereignty of parliament and western institutions. His writings earned him nine months' imprisonment (1874). From his cell he contributed to the periodical *Rad* ("Work"). On his release he edited the newspaper *Oslobodjenje* ("Liberation") till poor health forced him to give it up. He died in Trieste on March 10 (N.S.; Feb. 26, O.S.), 1875.

A Marxist at first, Marković gradually became a left-wing democrat. He wanted the masses to be concerned with politics; he awakened an interest in the study of economics; he influenced the realistic trend in Serbian literature; and he had a strong ascendancy over a number of educated young people who first learned from him the elements of socialism. His ideas, neither particularly original nor exact, were often contradictory. There was no capitalism in Serbia during his lifetime, and scarcely any working class. He therefore attacked civil servants, though they were not capitalists, and favoured small holders, though they were not proletarians. A courageous fighter, a skilled popularizer and a great controversialist, he left a number of devoted admirers. The Serbian Radical party owed many of its ideas to Marković's radical socialism. His collected works (eight volumes) appeared in 1891–1912.

MARL, an earthy mixture of fine-grained minerals. The term is applied to a great variety of sediments and rocks with a considerable range of composition. Calcareous marls grade into clays by diminution in the amount of lime, and into clayey limestones. Greensand marls contain the mineral glauconite, which is a complex silicate of alumina, iron and potassium. The greensand marls are widely distributed along the Atlantic coast in the United States and in Europe. Similar deposits occur in New Zealand. Because of their base-exchange properties the glauconitic marls are used in water-softening units. (See also GREENSAND; GLAUCONITE.)

Both marine and fresh-water marls are most commonly earthy and of a white, gray or brownish colour. However, red and black marls are found. In calcareous marine marls some lime is present in the form of shells (as in the Coralline crag of East Anglia, the Oligocene marls of the Isle of Wight, etc.); in others it is a fine impalpable powder mixed with clay and siliceous silt. Fresh-water marl may be similar in composition to marine marl. Much of the calcium carbonate in lake deposits is precipitated by bacteria and by algae such as the stoneworts. However, some lake marls contain numerous fragments of the shells of fresh-water snails and bivalves. Large deposits of fresh-water marl which contain from 80% to 90% of calcium carbonate and less than 3% of magnesium carbonate have been used as the calcareous material required in the manufacture of insulating material and portland cement. Marl also is used as a liming material and in making bricks. (G. A. T.)

MARLBOROUGH, EARLS AND DUKES OF. The earldom of Marlborough was held by the family of Ley from 1626 to 1679. JAMES LEY (c. 1552–1629), 1st earl, was lord chief justice of the King's Bench in Ireland (1604–08) and then in England (1621–24); he was also a member of parliament, first for Westbury and later for Bath, and was lord high treasurer from 1624 to 1628. He was created Baron Ley of Ley in 1624 and earl of Marlborough in 1626. JAMES (1618–1665), 3rd earl, was a sailor who was killed at the battle of Solebay on June 2, 1665, while fighting the Dutch. On the death of WILLIAM (1612–79), 4th earl and uncle of the 3rd earl, the title lapsed.

The title was revived in 1689 for JOHN CHURCHILL (1650–1722; see MARLBOROUGH, JOHN CHURCHILL, 1st Duke of), who, with his wife, Sarah (see MARLBOROUGH, SARAH JENNINGS, Duchess of), played an important part in politics under William III and Anne. For his successful military campaigns in Europe, Marlborough was raised to a dukedom in Dec. 1702. HENRIETTA (1681–1733), the 1st duke's eldest surviving daughter, who had married Francis, 2nd earl of Godolphin, inherited the title in her own right by an act of parliament passed in 1706. On her death in 1733 the title passed to her nephew CHARLES SPENSER (1706–58), 4th earl Sunderland, who became the 3rd duke; his mother was Anne, the youngest sur-

viving daughter of the 1st duke, who had married Charles Spencer, 3rd earl Sunderland. He fought at Dettingen and in the Seven Years' War and was lord privy seal in 1755. **GEORGE** (1739–1817), 4th duke, was lord privy seal (1763–65) and a Grenville Whig. He supported Charles James Fox over the India bill, but later followed William Pitt the younger. **GEORGE** (1766–1840), 5th duke, took the additional surname of Churchill in 1807. **JOHN** (1822–83), 7th duke, was lord president of the council (1867–68) and lord lieutenant of Ireland during 1876–80. His third son was the Conservative politician Lord Randolph Churchill, whose own son was Sir Winston Churchill, the prime minister.

CHARLES (1871–1934), 9th duke, was paymaster general from 1899 to 1902 and undersecretary for the colonies from 1903 to 1905. He married in 1895 Consuelo Vanderbilt, the American heiress, who obtained a divorce from him in 1921. **JOHN** (1897–), 10th duke, succeeded to the title in 1934.

MARLBOROUGH, JOHN CHURCHILL, 1ST DUKE OF (1650–1722), English soldier who won great victories against the French in the War of the Spanish Succession, was born on May 26, 1650, at Ashe, in the parish of Musbury, Devon, the son of an impoverished royalist squire. He attended St. Paul's school from 1664 to 1665; and from his early circumstances he learned the virtues of frugality and the opportunities for affluence through court service. His sister Arabella became maid of honour to the duchess of York c. 1665, and later mistress to the duke, while John became the duke's page; henceforward the family affairs prospered. John became the lover of Charles II's mistress, Lady Castlemaine (later duchess of Cleveland), and prudently purchased an annuity with a gift of £5,000 from her. He received a commission in the foot guards in 1667 and served at Tangier from c. 1668 to 1670.

In the third Dutch War (1672–74), Churchill served with the allied fleet that was defeated at Solebay on May 28, 1672, and was promoted captain. He went with the English troops sent in Dec. 1672 to assist Louis XIV against the Dutch, and distinguished himself at Maastricht with the duke of Monmouth. He was appointed colonel of the English regiment by Louis XIV in 1674 and served with distinction at Enzheim. He then served at court and on minor diplomatic missions and refused further military service under Louis XIV in order to press his suit with Sarah Jennings, an attendant upon the princess (afterward Queen) Anne. With the assistance of the duchess of York they were married secretly in the winter of 1677–78. John rose rapidly; he was created Baron Churchill in the Scottish peerage in 1682 and became colonel of the 1st Royal Dragoons in 1683. Meanwhile Sarah established her ascendancy over Anne and became a lady of the bedchamber.

On the accession of James II in 1685 Churchill was dispatched to ask Louis XIV for greater subsidies for the English crown, and after James's coronation was created lord of the bedchamber and Baron Churchill in the English peerage. He was made second-in-command of the force sent to put down Monmouth's rebellion, was promoted major general and helped to wrest victory from the night engagement at Sedgemoor (July 5, 1685). James II then proceeded more openly with his Catholicizing policy, against which Churchill was predisposed by principle, by prudence and by his connection with the stanchly Protestant Princess Anne. By Aug. 1688 Churchill had put himself into the hands of the prince of Orange (subsequently William III). After William's landing in England, Churchill was made lieutenant general of James's army. He undertook to defend the king's person but deserted his cause to join William at Axminster.

For these services Churchill was sworn a privy counselor and created earl of Marlborough in 1689, and served effectively under the prince of Waldeck with an English brigade in the Netherlands. Marlborough served upon the committee of nine who managed the government during William's absence in Ireland in June 1690. In the autumn Marlborough made an effective attack upon Cork and Kinsale. Relations between William and Marlborough were nevertheless cooling. The Churchills warmly espoused Anne's campaign in 1689 for a parliamentary settlement of £50,000 per annum and incurred the displeasure of Queen Mary. Marlborough was in touch with James at St. Germain, and threatened immediate danger by organizing opposition around the reversionary interest of the

princess Anne. The queen brought about a permanent breach with Anne in attempting to compel her to dismiss Sarah in 1692; Marlborough was deprived of all his offices and was excluded from the court and was even temporarily imprisoned in the Tower of London in May 1692 upon forged accusations of treason. The later charge that Marlborough betrayed the attack upon Brest in May 1694 rested upon Jacobite evidence too dubious for credit. After the death of Mary in 1694, Marlborough promoted a reconciliation between Anne and William, and when he was implicated in Sir John Fenwick's confession to an assassination plot in 1696, the king ignored the charges.

Marlborough returned to favour in 1698 as governor to Anne's son, the duke of Gloucester, and annually till 1700 was appointed one of the lords justices. His eldest daughter, Henrietta, married the son of his old ally, Lord Godolphin, in 1698 (see **GODOLPHIN**, **SIDNEY GODOLPHIN**, Earl of) and in 1700 his daughter Anne married Charles, the only son of Lord Sunderland. Princess Anne granted each a dowry, and during her reign these marriages had important political consequences. Marlborough still conceived himself as serving Anne rather than William; nevertheless as the Spanish Succession crisis approached, William III appointed Marlborough commander in chief and plenipotentiary in Holland.

Upon Anne's accession in 1702, Marlborough was made a knight of the Garter, captain general of the forces and master general of the ordnance; his wife received numerous household offices and Godolphin became lord treasurer. Marlborough's campaigns were, however, hampered by the opposition of allies both at home and abroad. The Dutch preferred the protection and extension of their own territory to Marlborough's bold schemes of attacking France, while the emperor Leopold I coveted the Spanish throne for his son. However, Marlborough captured Kaiserswerth in 1702 and cleared the territory between the Rhine and Meuse rivers. For these services he was created duke of Marlborough in Dec. 1702 and was awarded £5,000 per annum for the duration of the queen's life. Marlborough had been forced to let slip valuable opportunities of destroying the French army under Louis, duc de Boufflers, in 1702 and in 1703 was again constricted by the allies' lack of enterprise. Bonn, Huy and Limburg were captured but Marlborough's plans for an attack on Antwerp were rejected.

Meanwhile Bavaria had entered the war and joined the French in the attack on the heart of the Holy Roman empire while the Austrian armies were engaged on the Rhine and in Italy. Without assistance to Austria the war would be lost, but Marlborough knew that the Dutch would oppose a distant campaign; therefore he attacked upon the Moselle river to deceive both friend and foe and deceived them again by a feint against Alsace. Though his march into central Europe caused general surprise, it was an obvious move and Marlborough's genius was revealed in the organization rather than the conception of the campaign. After a fierce struggle he took the Schellenberg fortress and opened the crossing of the Danube river at Donauwörth. On Aug. 13, 1704, he engaged the main enemy force at Blenheim (q.v.); a quarter (about 12,000) of his own troops were killed or wounded, but the enemy casualties exceeded three times that number. On his return to the Netherlands, Marlborough took Trier and Trarbach. These victories altered the whole balance of power in Europe and put France firmly on the defensive. Marlborough received the principality of Mindelheim from the emperor and, despite Tory animosity, was granted the royal manor of Woodstock by act of parliament. The queen accompanied the grant with an order for the construction of the palace, on which public money was spent vastly in excess of the £100,000 intended.

In 1705 Marlborough was confident that the French could be beaten in any but the strongest of positions, and wished to attack upon the Moselle. The Dutch and Austrians, however, were less keen to co-operate after a year's success; Prince Eugene was sent to Italy, and no armies were forthcoming from the German princes on the Rhine. The Moselle campaign was therefore abandoned. Marlborough broke through the Lines of Brabant at Elixem in July, taking 3,000 prisoners, but again lack of Dutch support prevented him from exploiting the victory. The French were allowed to rally at Louvain, but they abandoned the Lines of Brabant. The Grand

Alliance, which had made small progress toward its aim of the conquest of the Netherlands and Italy, by 1706 needed a victory to keep it going; the prospects of a decisive engagement were enhanced by an increased deference toward Marlborough on the part of the Dutch government and a certain contempt of him among the French leaders. Moreover, Louis XIV concluded that he must have peace and could only get satisfactory terms by an assault on all fronts. Consequently, when Marlborough threatened to move between Namur and the French army under the duc de Villeroy at Louvain and Brussels, Villeroy offered battle near Ramillies, drawing up his lines in a concave arc (May 23, 1706). Feinting an attack upon the right, Marlborough concentrated his main attack upon the left, to the south of the village of Ramillies. There the Dutch bore the sharpest fighting and Marlborough himself narrowly escaped with his life. The result was a crushing victory in which the French losses, in killed, wounded and deserters, may have been five or six times those of the allies. Most of Belgium was overrun and between June and October four successful sieges were undertaken at Ostend, Dendermonde, Menin and Ath.

During the advance, Marlborough was engaged in active diplomacy to keep the allies together, for peace with France seemed imminent. He showed no disposition for peace, and the Dutch supported him in the hope of pushing their Barrier fortress claims. The government of the Netherlands caused immediate discord among the allies. The Austrians wanted full sovereignty; the Dutch wanted to govern for the time being and to continue to occupy the Barrier fortresses of which the emperor offered Marlborough the governorship. Dutch opposition compelled Marlborough to decline reluctantly, but he hoped for appointment later and confidence among the three parties never fully recovered. With the triumph of Prince Eugene in Italy, the allies' immediate objectives were achieved and Marlborough's desire for war inevitably inclined him toward the Whigs as the war party in England. On Dec. 3, 1706, his son-in-law Sunderland became secretary of state.

With these dissensions among the allies, France and Spain possessed substantial powers of resistance. Marlborough accomplished nothing in the Netherlands in 1707, the duc de Villars made a raid into Germany and there were allied failures at Almanza and before Toulon. The allies urgently needed victory in 1708, while France was again hoping for success as a prelude to peace. The French took Ghent and Bruges. Marlborough, however, caught the French army at Oudenarde on July 8, 1708, and in a disorderly encounter beat the French back from a strong position and had almost enveloped them when darkness fell. After this victory Marlborough favoured an attack upon Paris, but he was overruled by Eugene.

Instead, the allies laid siege to Lille. In some ways it was a more dangerous enterprise, but in December both the town and citadel of Lille surrendered. Marlborough went on to capture Ghent and Bruges. By then Marlborough was secretly negotiating peace through his nephew, the duke of Berwick, marshal of France, hoping to secure a substantial French bribe for his services. Early in 1709 the marquis de Torcy was sent to The Hague to negotiate, and he promised everything he was able to concede. Negotiations, however, failed on Louis' refusal to undertake to deliver up Spain to Charles III (afterward the emperor Charles VI) within two months, a condition which the allies failed to realize he could not possibly fulfill. The result was that the French made a last desperate effort and that the morale of their troops rose tremendously. The economic crisis in France even facilitated the recruiting of an army of 80,000 men, which faced Marlborough in the Netherlands in 1709. Finding Villars' position too strong to attack, Marlborough attacked Tournai which, after a two-month siege of peculiar horror, was taken. Marlborough joined battle with Villars, who had fortified a strong position in the woods near Malplaquet on Sept. 11, 1709. The French fought better than at any time since Blenheim, and although they were defeated they withdrew in good order, leaving few prisoners. Marlborough's army was in no condition for the pursuit, but on Oct. 20 Mons was taken.

The small return for the hard fight at Malplaquet helped to weaken Marlborough's position at home. The Whigs were more

firmly established in office than ever, but the Tory campaign for peace was strengthened by the belief that war could accomplish nothing further and was only being prolonged by the party and personal interest of the duke. This suspicion Marlborough aggravated by demanding to be appointed captain general for life. The duchess helped to destroy her credit with the queen by her support of the Whigs, and in 1710 the queen began her counterattack. Marlborough could only postpone a regiment being given to Col. John Hill, the brother of his wife's rival, Mrs. (afterward Lady) Abigail Masham. Sidney, earl of Godolphin, was dismissed; the Tories, bent on peace, returned to office, and won a sweeping victory at the elections.

Marlborough planned further progress toward the French frontier in 1710 and took Douai, but his authority was slowly ebbing. While negotiations for peace were in progress between the English and French ministers in 1711, Marlborough began his last campaign. Henry St. John (afterward Lord Bolingbroke) took five British battalions away; Eugene was withdrawn to defend the Rhine. Villars was entrenched behind the *ne plus ultra* lines, but Marlborough evaded him by skilful marching, crossed the lines and took Bouchain from the rear. He hoped to reduce Le Quesnoy, the last fortress on the road to Paris, but the Dutch and the English governments, deep in peace negotiations, refused support. Marlborough was dismissed from all his offices on Dec. 31, 1711, and, attacked in parliament and the press, accused of swindling in the building of Blenheim, he went abroad. While abroad he corresponded with the Jacobites, and made firm contact with the court of Hanover. After the accession of George I in 1714 he resumed his old military offices, but in 1716 was broken in health by two paralytic strokes. He continued to perform his public functions, though clearly declining, and died at Cranbourne Lodge, Windsor, on June 16, 1722, after a third stroke.

For all his duplicity and self-seeking, Marlborough had rendered inestimable services to the Protestant succession in England, and as a general he was generous to his allies and took infinite care of the welfare of his men.

MARLBOROUGH, SARAH JENNINGS, DUCHESS OF (1660-1744), wife of John Churchill, 1st duke of Marlborough (q.v.), and confidante of Queen Anne, was the daughter of Richard Jennings and was born at Sandridge, near St. Albans, on May 29, 1660. As a child she formed a friendship with the princess Anne and entered the household of the duke of York in 1673. Beautiful and vivacious, self-possessed and self-reliant, she had a venomous temper when roused. Her romance with John Churchill, who was also at court, began late in 1675; his notorious amours ceased abruptly and he put his courtship of her even before military preferment. Sarah's attachment was equally deep and passionate and contrasted impressively with the rancorous hatreds which filled much of her life. Churchill's parents opposed an unremunerative match, but with the assistance of the duchess of York the couple were married secretly during the winter of 1677-78. Sarah was devoted to the princess Anne, who came to depend upon her; they addressed each other as Mrs. Morley and Mrs. Freeman and upon Anne's marriage in 1683, Sarah became one of the ladies of the bedchamber. Sarah escorted Anne to meet the prince of Orange in 1688 and persuaded her to accept the statutory settlement of the succession. Deeply involved in Anne's struggle for a civil list annuity in 1689, Sarah was later granted an annual pension of £1,000. Upon Marlborough's disgrace in 1692, Queen Mary compelled Anne to dismiss Sarah from her offices and excluded her from court; but after Mary's death in 1694, Anne and William III were reconciled and the Marlboroughs returned to favour. When Sarah's daughters were married Anne gave each a dowry of £5,000.

After Anne's accession, the Marlboroughs enjoyed great favour; Sarah and her married daughters obtained household offices, though she exercised little political influence. But Sarah's favour was in

the balance: for the queen had High Church sympathies, while Sarah was a strong Whig. This difference came to a head after 1705; the high Tories had fallen from office, but the queen, supported by Robert Harley (later earl of Oxford), stoutly resisted taking in the Whigs. Sarah persistently urged her to bring the earl of Sunderland into office in 1706, and mutual irritation showed that the friendship of Anne and Sarah was cooling. Harley was clearly using Mrs. (later Lady) Abigail Masham to supplant Sarah in Anne's affections by 1707. When Anne's husband, the prince of Denmark, died in 1708, relations between Anne and Sarah temporarily improved, but Mrs. Masham's power steadily advanced. The Whig junto secured office, but Sarah quarreled with them because they disliked her husband's old friend, Sidney, earl of Godolphin.

The Whigs, Godolphin and Sarah lost influence in 1710. Jonathan Swift accused her in the *Examiner* of misappropriating £22,000 a year from the privy purse; Sarah described the sum as arrears of pension money. Anne dismissed her and they never met again. The Marlboroughs settled at Frankfort am Main in 1713. After the Hanoverian accession they returned to Blenheim, and after the duke's death in 1722, Sarah completed the building of the palace, quarreling violently with its architect, Sir John Vanbrugh, with her daughters and with her son-in-law, the earl of Sunderland, and rebuffed all suitors. Sarah published an account of her conduct in 1742. She died at Marlborough house in London on Oct. 18, 1744.

MARLBOROUGH, a municipal borough and market town of Wiltshire, Eng., lies in an upland valley of the Marlborough downs, watered by the river Kennet, 28 mi. N. of Salisbury and 18 mi. W. of Newbury on the London to Bath road. Pop. (1961) 4,852. The broad High street is flanked with houses dating from the 16th century onward. At its west end is St. Mary the Virgin's, originally a Norman church, and at the east end, behind the town hall (1903), is St. Peter and St. Paul's, dating from the 15th century. Behind St. Mary's is Marlborough college, a well-known public school for boys. It was founded in 1843 mainly for the sons of clergy, and four foundation scholarships and certain other privileges are still reserved for clergymen's families. Within the grounds of the college is the Castle mound (a legendary birthplace of Merlin), where traces of Neolithic and Roman occupation have been found. From the 11th century a royal castle stood there which from the time of William I, who established a mint, until the Wars of the Roses, when it fell into disrepair, was visited by many kings and queens. Savernake forest, about 1 mi. S.E., was then a crown forest and royal hunting ground. In 1189 King John was married to Isabella (Avice) of Gloucester in the castle chapel, and in 1204 John granted the town its first charter (the present charter dates from 1575). Henry III held his last parliament in the castle (1267) when the Statute of Marlborough, curtailing royal prerogative, was passed. In 1316 the priory of White Friars was founded; the site is now occupied by a boarding house of Marlborough college. The borough held a common seal in 1353 and its ancient arms were confirmed in 1565. During the reign of Edward VI, who in 1550 founded the grammar school (since 1947 a coeducational school), the castle site, together with Savernake forest, passed to the Seymours. This family supported the king in the Civil War, while the town supported parliament and was besieged and captured in 1642. In 1653 a great fire destroyed much of Marlborough, and in 1679 and 1690 other fires occurred. After the last fire an act of parliament was passed forbidding the use of thatch in Marlborough. The castle, rebuilt in the 17th century and again in the 18th, is now part of Marlborough college. From 1295 until 1867 the borough returned two members to parliament and until 1885 one member, after which it was merged in the East Wiltshire division; it is now in that of Devizes.

In Presbute by the Kennet stands the Norman church of St. George, largely restored in 1854; it contains a black basalt font which is said to have come from the castle chapel. Seven miles west of Marlborough is the prehistoric monument of Avebury (q.v.), with Silbury hill, a huge artificial mound, to the south.

The trade of the town is largely agricultural, with some light industries. A sheep fair is held on the common in August, and two other fairs, the "little mop" and the "big mop," are held in October.

MARLBOROUGH, a provincial district at the northeastern end of the South Island of New Zealand, embraces the parallel Wairau, Awatere and Clarence valleys, the lofty ranges between them, and the narrow strip between the Seaward Kaikoura range and the sea. Area 4,220 sq.mi.; pop. (1961) 27,748. Blenheim (pop. [1961] 11,956) and Picton (2,315), its port, are the only boroughs in this thinly populated district. In the Wairau valley, cradle of the South Island's wool industry, Merino sheep are reared on indigenous tussock grassland. Besides livestock, the lowlands support crops such as barley, peas and lucerne. At Lake Grassmere salt is produced by the solar evaporation of sea water, and Te Awaiti, Tory channel, has New Zealand's only remaining whaling station. (K. B. C.)

MARLIN, common name for several large sea fishes of the billfish family (Istiophoridae), which includes also sailfishes. They are among the most prized of big game fishes. The upper jaw is prolonged into a rounded spear; ventral fins are present and the dorsal fin, unlike that of the sailfishes, is not prominently enlarged to form a sail-like superstructure. They occur in the warm parts of all oceans and seasonally visit temperate regions in the northern hemisphere as far north as Nova Scotia and in the southern hemisphere as far south as Chile and the Cape of Good Hope. They are generally found traveling alone, in pairs or in small groups. The white marlin sometimes schools. Marlins feed on all kinds of smaller fishes that swim near the surface, such as mackerel, mullet and sardines, and on larger invertebrates, such as squids.

Because ichthyologists have had difficulty in obtaining enough specimens for comparative studies, there is considerable uncertainty regarding the number of species. Among those best known is the striped marlin (*Makaira audax*), ranging from southern California to northern Chile and westward into the Indian ocean and attaining 700 lb.; the blue marlin (*M. ampla*), widely distributed in the warm parts of the Atlantic and Pacific oceans and attaining over 1,600 lb.; and the white marlin (*M. albidus*), ranging in the Atlantic from Brazil to Nova Scotia, in the Mediterranean and off the coast of Portugal and attaining hardly more than 160 lb.

The black marlin (*Istiompax indicus* or *marlina*, also called *Makaira indica*) is the largest species, growing to over 15 ft. and near to 2,000 lb. It ranges over tropical and temperate waters of the Pacific and Indian oceans. A related genus of billfishes, *Tetrapturus*, the spearfishes, is distinguished from *Makaira* in having pectoral fins that are not much if at all longer than the lower jaw and a spear that is hardly longer than the deepest depth of the body. *Tetrapturus* species range in the warm parts of the Atlantic and Indian oceans and in the Pacific as far east as Hawaii. See also FISH. (L. A. Wd.)

MARLOW, an urban district of Buckinghamshire, Eng., lies on the banks of the Thames 33 mi. W. of London by road. Pop. (1961) 8,724. An iron suspension bridge, built in 1831, connects the counties of Buckinghamshire and Berkshire. The parish church of All Saints, by the bridge, was built in 1835, on the site of a previous church which dated from the 12th century, and the spire, 170 ft. high, was added at the beginning of the 20th century. The Roman Catholic church of St. Peter was opened in 1846. The Old Parsonage (14th century) has two fine Decorated windows. Opposite is Marlow place, built in 1720 for George II when prince of Wales. The house called Remnantz contained the Royal Military college from 1802 to 1812 when it moved to Sandhurst. Percy Bysshe Shelley lived at Shelley house from 1817 to 1818 and was visited there by Lord Byron. Sir William Borlase school for boys was founded in 1624. The town is mainly residential but in summer its boating facilities, especially the one-day regatta in June, attract many visitors.

Bisham abbey, now a national recreation centre, about 1 mi. N. of Marlow, dates back to the Domesday Book. Many famous men were buried within its precincts and Queen Elizabeth I lived there

for three years before coming to the throne.

Medmenham abbey, about 4 mi. S.W. of Marlow, is on the site of a monastery founded about A.D. 1200 by Cistercian monks. It became famous in the 18th century as the headquarters of "The Hell Fire Club," founded by Sir Francis Dashwood and notorious for the revells of its members, whose motto was *Fay ce que vouldras* ("Do as you like"). (C. W. RE.)

MARLOWE, CHRISTOPHER (1564–1593), a major English poet and Shakespeare's most important predecessor in English drama. The son of a Canterbury shoemaker, he was baptized on Feb. 26, 1564. In 1579 he entered the King's school, Canterbury, and in 1581 proceeded to Corpus Christi college, Cambridge, where he obtained his B.A. in 1584, but thereafter frequent absences from the university are recorded; in 1587 he was allowed to proceed to the M.A. only after a letter from the privy council to the university had made it clear that his service to the government had been useful, and that his government employment, doubtless in Elizabeth I's secret service, had on occasion taken him abroad. After this he is found in London, writing for the theatres, from time to time in trouble with authority (in 1589 he was concerned in an affray in which one William Bradley was killed, and this led to a brief time in Newgate; and in May 1592 two constables of Shoreditch asked that he be bound over to keep the peace), and probably also engaging himself from time to time in government service. Edward Phillips in *Theatrum Poetarum* (1675) asserted that Marlowe was an actor before being a playwright, but this statement may depend on nothing more than the notion that his career might well have taken the same course as Shakespeare's. He won a dangerous reputation for "atheism," but this could in Elizabeth I's time indicate merely unorthodox religious opinions; in Robert Greene's deathbed tract, *Greenes Groatsworth of Wit . . .*, he is addressed as a "famous gracer of Tragedians" and reproved for having said, like Greene himself, "There is no god," and for having studied "pestilent Machiuiilian pollicie." When Henry Chettle, the publisher of this tract, apologized after Greene's death for its attack on Shakespeare, he made it clear that he was indifferent to any resentment felt by Marlowe. There is much further evidence of his unorthodoxy, notably in the denunciation of him written by the spy Richard Baines and in the letter of Thomas Kyd to the lord keeper, Sir John Puckering, in 1593 after Marlowe's death, alleging that certain papers found in his room belonged to Marlowe, who had shared the room two years before. Both Baines and Kyd suggest atheism in the stricter sense and a persistent delight in blasphemy. On not very strong evidence it appears, too, that Marlowe may have been associated in some measure with Sir Walter Raleigh, who at this time was certainly adventurous in his religious ideas. On May 18, 1593, the privy council issued an order for Marlowe's arrest; two days later the poet was ordered to give daily attendance on their lordships. On May 30, however, Marlowe was killed by Ingram Friser, in the company of Nicholas Skeres and Robert Poley, at a house in Deptford, where they had spent most of the day and where, it was alleged, they quarreled concerning the reckoning: Skeres and Poley, at least, had been engaged in government service. Marlowe was buried at Deptford on June 1 and Friser pardoned on June 28.

Plays.—"Tamburlaine."—Probably the earliest of Marlowe's plays was the two-part *Tamburlaine the Great* (c. 1587; publ. 1590), where his characteristic "mighty line" (as Ben Jonson was to call it in his verses prefixed to the Shakespeare Folio of 1623) established blank verse as the staple medium for later Elizabethan and Jacobean dramatic writing. It appears that originally Marlowe intended to write only the first part, concluding with Tamburlaine's marriage to Zenocrate and his making "truce with all the world." But, according to the prologue to part II, the popularity of the first part encouraged Marlowe to continue the story to Tamburlaine's death. This gave him some difficulty, as he had almost exhausted his historical sources in part I; consequently the sequel has, at first glance, an appearance of "padding." Yet the effort necessarily demanded in the writing of a continuation made the young playwright look more coldly and searchingly at the hero he had chosen: the resultant impression that part II gives is more complex and more judicial than anything that clearly emerges from

part I. Or, perhaps to put it more exactly, part II makes explicit certain notions that were below the surface, insufficiently recognized even by the dramatist, in part I. Tamburlaine is a man avid for power and luxury and the possession of beauty: at the beginning of part I an obscure Scythian shepherd, he wins the crown of Persia by eloquence and bravery and a readiness to discard loyalty; he conquers Bajazeth, emperor of Turkey; he puts the town of Damascus to the sword; he conquers the soldan (sultan) of Egypt but, at the instance of the soldan's daughter Zenocrate, the captive whom he loves, he spares him and makes truce. In part II his conquests are further extended; whenever he fights a battle he must win, even when his last illness is upon him; but Zenocrate dies and their three sons provide a manifestly imperfect means for ensuring the preservation of his wide dominions; he kills Calyphas, one of these sons, when he refuses to follow his father into battle. Always, too, there are more battles to fight: when for a moment he has no immediate opponent on earth, he dreams of leading his army against the powers of heaven, though at other times he glories in seeing himself as "the scourge of God"; he burns the Koran, for he will have no intermediary between God and himself, and there is a hint of doubt whether even God is to be granted recognition. Certainly Marlowe feels sympathy with his hero, giving him magnificent verses to speak, delighting in his dreams of power and of the possession of beauty. Thus Tamburlaine in these lines makes us at least partially respond to his notion of human glory:

Nature, that fram'd us of four elements
Warring within our breasts for regiment,
Doth teach us all to have aspiring minds:
Our souls, whose faculties can comprehend
The wondrous architecture of the world,
And measure every wandering planet's course,
Still climbing after knowledge infinite,
And always moving as the restless spheres,
Will us to wear ourselves and never rest,
Until we reach the ripest fruit of all,
That perfect bliss and sole felicity,
The sweet fruition of an earthly crown.

But, especially in part II, there are other strains: the hero can be absurd in his continual striving after yet further demonstrations of his power; his cruelty, which is extreme, becomes sickening; his human weakness is increasingly underlined, most notably in the onset of his fatal illness immediately after his arrogant burning of the Koran. In this early play Marlowe shows already a power to view a tragic hero from more than one angle, achieving a simultaneous vision of grandeur and impotence.

"*Dr. Faustus*."—Marlowe's most famous play is *The Tragical History of Dr. Faustus*, but it has survived only in a corrupt form and its date of composition has been much disputed. It was first published in 1604, and another version appeared in 1616. It has been argued by Sir Walter Greg (see *Bibliography*) that the 1604 text is a corrupt version of the play as Marlowe ultimately revised it, and that the 1616 text depends partly on the author's unrevised manuscript and partly on the 1604 text. The source of the play seems without question to be the English translation of the German *Faustbuch* (1587), but no edition of the English translation is known to exist before 1592 and Greg has argued on bibliographical grounds that the extant edition is the earliest. This would put Marlowe's *Faustus* in 1592–93, but a difficulty arises in the apparent echoing of Faustus' final speech of remorse in both Greene's *Frier Bacon and Frier Bongay* (generally dated c. 1589; publ. 1594) and Greene's and Thomas Lodge's *A Looking Glasse for London and England* (c. 1590; publ. 1594). Certainly there are lines in *Faustus* which seem more mature in poetic craftsmanship than anything to be found elsewhere in Marlowe's work, but, since Greg's analysis of the two texts suggests revision, it remains a possibility that these lines were not in an original version that dated from soon after *Tamburlaine*. This, admittedly, does not meet Greg's bibliographical arguments, but it is a question whether they are conclusive.

Faustus takes over the dramatic framework of the morality dramas, presenting a story of temptation, fall and damnation, with a free use of morality figures such as the Good Angel and the Bad Angel, the Seven Deadly Sins, along with Lucifer and Mephisto-

philis. P. H. Kocher has argued in *Christopher Marlowe: a Study of His Thought, Learning, and Character* (1946) that Marlowe was attracted to the subject because it gave him an opportunity of voicing atheistical or blasphemous opinions through the mouth of his chief character, while safeguarding himself by the use of the traditional morality framework. Yet, as Kocher admits, the play gives eloquent expression to the idea of damnation, in the moving lament of Mephistophilis for a lost heaven, and to the idea of a possible redemption (though ultimately impossible for Faustus) through Christ's blood:

The stars move still, time runs, the clock will strike,
The devil will come, and Faustus must be damn'd.
O, I'll leap up to my God!—Who pulls me down?—
See, see, where Christ's blood streams in the firmament!
One drop would save my soul, half a drop: ah, my Christ!—
Ah, rend not my heart for naming of my Christ!
Yet will I call on him: O, spare me, Lucifer!—
Where is it now? 'tis gone: and see, where God
Stretcheth out his arm, and bends his ireful brows!
Mountains and hills, come, come, and fall on me,
And hide me from the heavy wrath of God!

Just as in *Tamburlaine* Marlowe had seen the cruelty and absurdity of his hero as well as his magnificence, so here he can enter into Faustus' ambition while seeing him too as absurd and wanton. Yet in the course of the play there is suggested a carefully subdued resentment against a cosmic system that includes the initial possibility and the ultimate certainty of Faustus' damnation. Certainly Marlowe shows here an enormous interest in theological detail (which has been brought out particularly by Kocher and in Greg's article, "The Damnation of Faustus," *Modern Language Review*, vol. xli, no. 2, pp. 97-107, April 1946), an interest of a kind and degree that suggest detached scrutiny. The economy of the play leaves much to be criticized: it has frequently been assumed that the comic and farcical scenes were written by one or more collaborators, but there is no firm evidence for this. Although their workmanship is crude, in idea they contribute to the play's total statement, bringing out the essential absurdity of Faustus' dream. (See also FAUST; MEPHISTOPHELES.)

Other Plays.—In *The Famous Tragedy of the Rich Jew of Malta* (c. 1589) there is another power-hungry figure in the Jew Barabbas, who in the villainous society of Christian Malta shows no scruple in self-advancement. But this figure is more closely incorporated within his society than either Tamburlaine, the supreme conqueror, or Faustus, the lonely adventurer against God. In the end Barabbas is overcome, not by a divine stroke but by the concerted action of his human enemies. There is a difficulty in deciding how fully the extant text of *The Jew of Malta* represents Marlowe's original play, for it was not published till 1633, after a successful revival at Charles I's court under the sponsorship of Thomas Heywood. But *The Jew* is to be closely associated with *The Massacre at Paris* (1593), a dramatic presentation of incidents from contemporary French history, including the massacre of St. Bartholomew, and with *The Troublesome Raigne and Lamentable Death of Edward the Second* (c. 1592; publ. 1594), Marlowe's great contribution to the Elizabethan plays on historical themes. *The Massacre* introduces in the duke of Guise a figure unscrupulously avid for power, and the same play's brief representation of the philosopher Ramus, a victim of the massacre, gives another, though more favourably drawn, example of the man ready to run counter to received opinion and to dare greatly. So in the younger Mortimer of *Edward the Second* Marlowe shows a man developing an appetite for power and increasingly corrupted as power comes to him. In each instance the dramatist shares in the excitement of the pursuit of glory, but the three plays are at one in presenting such figures within a social framework: the notion of social responsibility, the notion of corruption through power, the notion of the suffering that the exercise of power entails, are all prominently within the dramatist's concern. Apart from *Tamburlaine* and the minor work *The Tragedie of Dido Queene of Carthage* (of uncertain date, published 1594 and written in collaboration with Thomas Nashe), *Edward the Second* is the only one of Marlowe's plays the extant text of which is to be relied on as adequately representing the author's manuscript. And certainly *Edward the Second* is a major work, not merely one

of the first Elizabethan plays on an English historical theme. The relationships linking the king, his neglected queen, his favourite Gaveston, the ambitious Mortimer, are studied with detached sympathy and remarkable understanding: no character here is lightly disposed of, and the abdication and the brutal murder of Edward show the same dark imagination as appeared in the presenting of Faustus' last hour. Though this play, along with *The Jew* and *The Massacre*, shows Marlowe's fascinated response to the distorted Elizabethan idea of Machiavelli (for there is no certain evidence that he knew Machiavelli's writings), it shows a simultaneous awareness of the nature of disaster, the power of society, and the dark extent of an individual's suffering. T. S. Eliot in his essay on Marlowe (in *Selected Essays*, 1932; rev. ed. 1951) has suggested that in *The Jew of Malta* the playwright was working toward a form of grotesque comedy akin to Ben Jonson's; this brings out an aspect of the complexity of Marlowe's dramatic world, but may disregard the range of his sensitivity.

"Hero and Leander."—In addition to translations (Ovid's *Amores* and the first book of Lucan's *Pharsalia*), Marlowe's non-dramatic work includes the poem *Hero and Leander*, freely derived from Musaeus. This was incomplete at his death, the first two "sestiahs" of his composition being followed by four "sestiahs" by George Chapman: the joint work of the two poets was published in 1598. Marlowe's writing here shows an astonishing skill in the management of the narrative decasyllable couplet, and his sensual descriptions of the lovers and their meetings are to be linked with the superb erotic poetry of Faustus' address to the appearance of Helen near the end of his tragedy. No agreement has been reached on the composition date of Marlowe's share in the poem, but it must rank with *Tamburlaine*, *Faustus* and *Edward the Second* as a major work.

Apocrypha.—A play called *Lust's Dominion* was published as Marlowe's in 1657, and the lost *The Maiden's Holiday* was entered in the Stationers' Register in 1654 as the work of Marlowe and John Day. It is no longer customary to see Marlowe's hand in the *Henry VI* plays published in the Shakespeare First Folio. The attempt of Calvin Hoffman (*The Man Who Was Shakespeare* [U.S. title, *Murder of the Man Who Was Shakespeare*], 1955) to present him as the author of Shakespeare's work as a whole has won no scholarly support.

Dramatic Power.—Criticism of Marlowe has tended to exalt his lyric and rhetorical gifts above his skill as a dramatist. This is understandable in view of the quality of his utterance, and in view too of the defective state of the text of *Faustus*, *The Jew of Malta* and *The Massacre at Paris*. But on further examination he reveals a greater power of dramatic craftsmanship than is often recognized: part I of *Tamburlaine* is indeed almost laboriously patterned; part II depends on its discursiveness for its capacity to include a wide range of shrewd implication; *Faustus* shows at least a firm sense of what is required at a play's key moments; *Edward the Second* is expertly controlled throughout. And Marlowe has the conscious complexity of view that makes him both the forerunner and the peer of the Jacobean.

BIBLIOGRAPHY.—Editions.—The standard edition of Marlowe's work is that published in 6 vol. under the general editorship of R. H. Case (1930-33): this includes a biography by C. F. Tucker Brooke (1930), along with an edition of *Dido* in the same volume, and editions of *Tamburlaine* (ed. by U. M. Ellis-Fermor, 1930; rev. ed. 1951), *The Jew of Malta* and *The Massacre at Paris* (ed. by H. S. Bennett, 1931), *Poems* (ed. by L. C. Martin, 1931), *Faustus* (ed. by F. S. Boas, 1932, rev. ed. 1949) and *Edward II* (ed. by H. B. Charlton and R. D. Waller, 1933; rev. ed. by F. N. Lees, 1955). C. F. Tucker Brooke's ed. of the *Works* (1910) is the standard 1-vol. text. Sir Walter Greg's companion volumes, *Marlowe's Doctor Faustus 1604-1616: Parallel Texts* and *Doctor Faustus: a Conjectural Reconstruction* (both 1950) are of the first importance for the textual history of the play. Publication of separate editions of all the plays, in the Revels Series, began with *Faustus*, ed. by J. D. Jump (1962).

Criticism and Biography.—Critical and biographical writing on Marlowe is considerable in extent and uneven in quality. Kocher's book, and articles by Greg and Eliot have been mentioned above, include of importance, either for information or for critical comment, U. M. J. L. Hotson, *The Death of Christopher Marlowe* (1925); U. M. Ellis-Fermor, *Christopher Marlowe* (1927); F. S. Boas, *Marlowe: a Biographical and Critical Study* (1940); R. W. Battenhouse, *Marlowe's Tamburlaine* (1941); John Bakeless, *The Tragical History of Christo-*

pher Marlowe, 2 vol. (1942); H. Levin, *The Overreacher* (1952); F. P. Wilson, *Marlowe and the Early Shakespeare* (1953); J. P. Brockbank, *Marlowe: Dr. Faustus* (1962); D. Cole, *Suffering and Evil in the Plays of Christopher Marlowe* (1962); J. B. Steane, *Marlowe: a Critical Study* (1964). See also S. A. Tannenbaum, *Marlowe: a Concise Bibliography* (1937; supplement, 1947). (C. L.E.)

MARLOWE, JULIA (SARAH FRANCES FROST) (1866–1950), U.S. actress, was born near Keswick, Eng., on Aug. 17, 1866, and at an early age went with her family to the United States. Her first formal appearance on the stage was in New York in 1887, although she had before that traveled with a juvenile opera company. Her first great success was as Parthenia in *Ingomar*, and her subsequent presentations of Rosalind, Viola and Julia in *The Hunchback* confirmed her position as a "star." In 1894 she married Robert Taber, an actor, with whom she appeared until their divorce in 1900. Subsequently, she had great success as Barbara Frietchie in Clyde Fitch's play of that name, and in other dramas. Beginning in 1904, she acted with E. H. Sothern (q.v.)—to whom she was married, Aug. 17, 1911—in a notable series of Shakespearean plays, as well as in modern drama.

She retired in 1924 and died in New York city on Nov. 12, 1950.

MARMARA, SEA OF (Turkish MARMARA DENIZI, i.e., "sea of marble"; ancient PROPONTIS), the small inland sea which (in part) separates Turkey in Europe from Turkey in Asia, and is connected through the Bosphorus with the Black sea and through the Dardanelles with the Aegean. It is 175 mi. long (east to west) and nearly 50 mi. in extreme width. Despite its small area (4,429 sq.mi.) its average depth is about 270 fathoms reaching a maximum of 670 fathoms in the centre, the deepest parts (exceeding 500 fathoms) occurring in three depressions in the northern portion—one close to the European shore south of Tekirdag (Rodosto), another near the centre of the sea and a third at the mouth of the Gulf of Izmit (Izmit Körfezi).

There are two distinct island groups. The first comprises the Princes Islands (q.v.) in the northeast; the second consists of the Marmara Islands proper in the southwest, off the Kapidag peninsula (Kapidagi Yarımadası). Largest of the Marmara Islands are Marmara Adası (ancient Proconesus), Avsar Adası and Pasalimani Adası. They are composed mainly of granite, slate and marble which have been quarried since ancient times (hence the derivation of Marmara, i.e., *mermer* meaning "marble"). The Sea of Marmara was formed as a result of crustal movements which occurred at the end of the Tertiary and in the first half of the Pleistocene epoch. It is an area of frequent earthquakes. The salinity averages 22‰; this increases, however, from the northeast toward the Dardanelles. Surface waters generally drift to the southwest, but no strong current occurs. The Marmara Islands have important fishing and canning industries and many localities are also rapidly developing as tourist resorts. (N. Tü.; S. Er.; E. Tü.)

MARMION, COLUMBA (1858–1923), Irish Benedictine monk, abbot of Maredsous, and noted theologian of Christian asceticism, was born in Dublin on April 1, 1858. He was christened Joseph but from the beginning of his monastic novitiate was known by his name in religion, Columba. Educated in Ireland, he completed his theological studies in Rome, where he was ordained priest in 1881. After a year of parochial work, he was appointed to teach philosophy at his own college, Holy Cross in Clonliffe, but a desire for the monastic life had steadily been growing within him and in 1886 he entered the novitiate of the Benedictine monastery of Maredsous (Namur, Belg.). In 1899 he was sent to the newly founded monastery of Mont-César at Louvain, where he functioned as prior and professor of theology until 1909, when he was elected abbot of Maredsous. He ruled that monastery until his death on Jan. 30, 1923.

Always a zealous and eager *conférencier*, Abbot Marmion himself had no interest in publishing, but in the last years of his life three volumes, compiled from notes taken down by his auditors and submitted to the correction of the abbot himself, did finally appear: *Le Christ, vie de l'âme* (1918), *Le Christ dans ses mystères* (1919) and *Le Christ, idéal du moine* (1922). These works had an astonishing circulation, which testifies to his extraordinary gifts as a spiritual writer: each was translated into nine languages. To them were added a number of posthumous publications.

BIBLIOGRAPHY.—D. R. Thibaut, *Dom Columba Marmion, Abbé de Maredsous* (1929; Eng. trans. 1932); Abbot M., *An Irish Tribute*, edited by the monks of Glenstal (1948); *Présence de Dom Marmion*, ed. by D. R. Thibaut (1948); D. Beauduin et al., "D. Marmion, un maître de la Spiritualité," in *La Vie spirituelle*, 78:3–128 (1948); Earl of Wicklow, *More About Dom Marmion*, in large part a translation of the preceding (1949). (Am. S.)

MARMONT, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE, DUC DE RAGUSE (1774–1852), French marshal whose long devotion to Napoleon came to a disappointing end in 1814, was born at Châtillon-sur-Seine in Burgundy on July 20, 1774. Having entered the artillery in 1792, he attached himself to Napoleon Bonaparte from 1793 and as his aide-de-camp in 1796 was so prominent in the Italian campaign that he could be made a colonel at the age of 22. Bonaparte made him a general on the voyage to Egypt in 1798, but kept him on artillery work until 1804, when he gave him command of a corps in Holland. Marmont brought this corps to Italy in 1805 without fighting; then, on July 7, 1806, he was appointed governor of Dalmatia. Though there was a Russian fleet in the Adriatic, he forced the Russians to abandon the siege of Ragusa (Dubrovnik) in September and secured control of the coast southward to Cattaro (Kotor). Furthermore he built roads and introduced a modern administration. He was made duc de Raguse in 1808, but lamented the "cruel obscurity" of a command so far away from the emperor. The war of 1809 brought him, with arduous fighting for his 10,000 men, from Zara (Zadar) to the Danube; and after the battle of Wagram he was made a marshal in July. After the peace of Vienna, however, he was sent back to be governor-general of Illyria.

A visit to Paris for the birth of Napoleon's son ended in Marmont's being sent to supersede André Masséna in command of the French army of Portugal in May 1811 (see PENINSULAR WAR). He formed the army into divisions under energetic officers and marched at once to help Soult at Badajoz. His operations turned on the key points of Ciudad Rodrigo and Badajoz. Within a year the French had lost both fortresses and Marmont was back on the upper Douro (Duero), having on four occasions avoided battle with the British. In July 1812 he pushed the British back across Castile and then, in the unexpected battle of Salamanca (July 22), was overwhelmed by a counterattack and severely wounded.

Marmont was given a corps in Germany in 1813. His conduct in the battles of Bautzen and Leipzig made him Napoleon's chief lieutenant for 1814. He commanded in the final battle at Paris (March 30, 1814), but four days later deserted Napoleon and passed to the allies. At the restoration of Louis XVIII he was made a peer of France, but French opinion never forgave him. During the revolution of July 1830, when his troops failed to hold Paris for Charles X, the dauphin (Louis, duc d'Angoulême) said that he had betrayed the king as he had betrayed "the other." In exile for the rest of his life, Marmont died in Venice on March 2, 1852. His *Mémoires* were published in eight volumes in 1856.

(I. D. E.)

MARMONTEL, JEAN FRANÇOIS (1723–1799), French poet, dramatist, novelist and critic, chiefly remembered for his *Mémoires d'un père*, was born at Bort, Cantal, on July 11, 1723. In 1745, encouraged by Voltaire, he settled in Paris where good management made his career more brilliant than his second-rate talent warranted. He was a mediocre dramatist, composing short-lived tragedies in the Voltairian manner and, for Niccolò Piccini, the libretti of *Didon* (1783) and *Pénélope* (1785). More original were his *Contes moraux* (1761), first published separately in the *Mercure de France* which Marmontel edited between 1758 and 1760. Sentimental and edifying, insipidly elegant in content and style, these tales were widely appreciated and imitated. Marmontel's reputation was considerably enhanced by the publication of two philosophical romances, *Bélisaire* (1767) and *Les Incas* (1777). The first was condemned by the Sorbonne because of its plea for religious toleration; the second denounced the evils of fanaticism.

Marmontel derived from Voltaire the liberal classicism he expounded in his articles for the *Encyclopédie* and in his *Éléments de littérature* (1787). Elected to the Académie Française in 1763, he became its permanent secretary in 1783. He was appointed

royal historiographer in 1771. During the Revolution he displayed his usual prudence, in 1792 retiring to the country near Gaillon, Normandy, where he wrote his most interesting work, the autobiographical *Mémoires d'un père* (1804), and where he died on Dec. 31, 1799.

BIBLIOGRAPHY.—*Oeuvres complètes*, 19 vol. (1818–20); *Mémoires*, 3 vol. (1891); S. Lenel, *Marmontel* (1902). (O. R. T.)

MARMOSET in the widest sense refers to any small South American monkey of the family Callithricidae, but strictly denotes the genus *Callithrix*. All members of the family agree in their small size, squirrellike form and habits and in having all the digits except the big toe terminating in clawlike structures that are an aid in scampering along tree branches. Differing from other American primates in having one pair less molar teeth in both jaws, marmosets are remarkable for their high-pitched voices and their preference for a diet of insects, spiders and fruit.

The most familiar species is the common marmoset (*Callithrix jacchus*), notable for its large white ear plumes and ringed tail. The group includes many species with remarkable coloration and bizarre adornments. The female gives birth to twins after a gestation period of about 145 days. See also PRIMATES.

(W. C. O. H.)

MARMOT, any of the large, thickly built, burrowing rodents of the genus *Marmota*, of which there are numerous species ranging from the Alps through Asia north of the Himalayas, and in North America. They are members of the squirrel family (Sciuridae). Some North American species are commonly called woodchucks (*q.v.*), especially *M. monax*. In addition to their stout build, brownish to black pelage and thickly haired tails, marmots are characterized by the absence of cheek pouches. Europe possesses two species, the Alpine or true marmot (*M. marmota*), and the more eastern bobac (*M. bobac*).

W. SUSCHITZKY
ALPINE MARMOTS (*MARMOTA MARMOTA*)

There are numerous kinds in central Asia, one of which, the red marmot (*M. caudata*), is a larger animal, with a longer tail. Marmots inhabit open country, either among mountains or in the plains; they associate in large colonies, forming burrows, each tenanted by a single family. During the daytime the hillock at the entrance to the burrow is frequently guarded by one or more members of the family. In the winter when the ground is deep in snow, marmots retire to the depths of their burrows to hibernate. They mate in early spring; one litter of two

to nine young is produced each year. Their food consists of green plants.

The yellow-bellied marmot (*M. flaviventris*) ranges from New Mexico and southern California to British Columbia, while the hoary marmot or whistler (*M. caligata*) is found from Alaska to the high mountains of Idaho.

See also RODENT.

MARNE, a *département* of northeastern France, formed in 1790 from parts of ancient Champagne (*q.v.*) and bounded north by the *départements* of Aisne and Ardennes, east by Meuse, south-east by Haute-Marne, south by Aube and west by Seine-et-Marne. Area 3,168 sq.mi. (8,205 sq.km.). Pop. (1962) 442,195.

Although the Marne river, crossing the *département* from south-east to northwest, drains most of its area, the north is drained by the upper Aisne in the forested highland of the Argonne and farther west by its tributaries the Suipe and Vesle; in the extreme southwest the *département* extends into the basin of the Aube, as that river approaches its confluence with the Seine near Romilly.

Most of the *département* lies within the belt of permeable chalk country, about 40 mi. wide, that girdles the Île-de-France, but in the west it extends on to the platform of Tertiary limestone itself. This dominates the chalk in an imposing, ragged escarpment, the

Falaise de l'Île-de-France, which reaches an altitude of almost 1,000 ft. overlooking Reims. There are rich grain lands on the limestone where it is enriched by a covering of *limon*; and on the lower slopes of the escarpment, both north and south of the Marne, the favourable sunny exposures and quick-warming, open-textured soils make possible the rich vineyards that supply the famous champagne wine industry of Reims, Épernay and nearby villages.

To the east, the slightly undulating chalk surface is extremely dry and has only a scant cover of poor soil, so that it merits the name *Champagne pouilleuse*. The great maneuvering grounds of the French army near Châlons-sur-Marne and Mailly-Champagne show the chalk country at its poorest. For long its chief use was as pasture for sheep, reared for their wool, but after the mid-19th century there were notable improvements. Extensive afforestation has been carried out, and pine plantations now relieve the bare, shaven landscape. They also provide valuable shelter belts for farms, and some sites of the earlier plantations now provide agriculture with soil that has been enriched with humus. Use of artificial manures has also enhanced the agricultural resources, but the chalk country is still sparsely peopled except in the widely spaced, trenchlike valleys, notably that of the Marne, favoured alike by shelter and water supply.

To the east, beyond the edge of the chalk outcrop, the Lower Cretaceous rocks, in contrast, are impermeable, and surface water is abundant or even excessive. The valleys of the Marne and its tributaries the Ornain and Blaise, converging upon Vitry-le-François, have fertile alluvial soils, but they cross a tract of varied, hilly and wooded country whose poor clay soils have resisted much agricultural development. Farther north the rugged Argonne massif interposes a historic barrier between Champagne and Lorraine.

By virtue of its situation as well as its physical character, Champagne has long been a passageway. Reims developed as a great trade centre in the middle ages, with famous fairs and an early important cloth industry. This has survived in the changed circumstances of modern industry by specializing upon materials of high quality. Reims and Châlons also have considerable engineering industries. Important roads and railways cross the *département* and canals connect the great navigable tributaries of the Seine with each other (Aisne-Marne canal) and with Lorraine (Marne-Rhine canal).

Although Reims is much the largest town and is the major ecclesiastical centre, with an archbishop, Châlons-sur-Marne, which is more centrally situated in the *département*, is the *préfecture*, and its see, under the archiepiscopal control of Reims, covers most of the *département*. For the administration of education, Châlons is the centre of an *académie*, but for justice the *département* comes under the court of appeal at Paris. The *département* is divided into five *arrondissements*, centred upon Châlons-sur-Marne, Reims, Épernay, Ste. Menes and Vitry-le-François. The last is a regular, planned town, founded in 1545 to replace the nearby market town of Vitry-en-Perthois, which had been destroyed in warfare. With other towns of the *département* it in turn suffered heavy damage in the wars of the 20th century, but the great cathedral at Reims, in which the kings of France were consecrated, survives as one of the chief glories of Gothic architecture. (A. E. S.)

MARNE, BATTLES OF THE (1914 and 1918), two battles fought by the Allied armies against the Germans in World War I.

The First Battle of the Marne.—By the first week in Sept. 1914 the northern flank of the Allied (Anglo-French) armies on the western front had been driven back to within 25 mi. of Paris. The formation of a new French army (the 6th, under Gen. Michael Joseph Maunoury), which threatened the right flank of Gen. Alexander von Kluck's 1st German army, and the resultant gap which occurred between the 1st and 2nd German armies, provided a favourable opportunity for the Allies to take the offensive.

On Sept. 7 the British expeditionary force under Field Marshal Sir John French advanced into the gap and crossed the Grand Morin river. By the morning of Sept. 9 they had begun an assault

crossing of the Marne river between La Ferté-sous-Jouarre and Château-Thierry. The two German armies were in full retreat and the pursuit northward continued until the Aisne river was reached on the night of Sept. 11—by which time French troops on the flanks had come up into line with the British. This ended the first battle of the Marne, a strategic rather than a tactical victory. (See WORLD WAR I: *Crisis of the Marne*.)

The Second Battle of the Marne.—In July 1918 the Germans made their last major attack of the war. The front selected ran 30 mi. to the east and 30 mi. to the west of Reims. Grouped along this front were 67 Allied divisions (56 French, 7 U.S., 2 British and 2 Italian), 24 of which comprised the 6th and 10th French armies assembled for an offensive west of Reims. Against these the Germans had concentrated 52 divisions.

The German attack began early on July 15. East of Reims, where the resolute French officer Gen. Henri Joseph Gouraud was in command, the attack failed and was not renewed. West of the town the Germans overran the two Italian divisions, but were halted by troops of the British XXII corps. Farther west, the attackers crossed the Marne and established a substantial bridgehead. Little progress was made on July 16 and 17, and at midnight on July 17–18 orders were issued to stop the offensive.

On July 18 the Allies counterattacked with French, British and U.S. divisions in the area west of Reims; and initial gains of several miles were made. By July 20 the Germans had withdrawn from the Marne bridgehead. They continued to conduct a fighting withdrawal until Aug. 2, when the counterattack came to an end. Allied casualties were about 112,000. The Germans lost about 168,000 men and 793 guns. (C. N. B.)

MARNE RIVER, in northern France is 326 mi. long and rises on the limestone plateau of Langres. It flows in a wide valley across the successive belts of Jurassic, Cretaceous and Tertiary rocks of the Paris basin toward Paris and joins the Seine at Charenton-le-Pont, just above Paris.

Leaving Langres on the left, the upper Marne flows north past Chaumont to St. Dizier, where it turns west. It enters the chalk platform of Champagne at Vitry-le-François, crosses the permeable chalk country in a wide trench, past Châlons-sur-Marne to Épernay in the famous wine-producing district, and then traverses the Tertiary limestone platform of the Île-de-France. Its valley there is flanked by the rich grain lands of Brie and Valois, and the river is joined by the Petit-Morin, Ourcq and Grand-Morin tributaries. The Marne is canalized upstream as far as Dizy, beyond which it is doubled by a lateral canal that connects with the Saône. Other canals connect the Marne with the Rhine at Vitry-le-François and with the Aisne at Condé-en-Brie. (AR. E. S.)

MARNIX VAN SINT ALDEGONDE, PHILIPS VAN (1540–1598), Flemish nobleman, statesman and author, one of the earliest Calvinist writers in the Netherlands. Born in Brussels in 1540, he studied at Louvain, Paris and Dôle. He intended to take orders but while staying in Italy became a Calvinist and studied at Geneva, 1560–61. Returning to the Netherlands, he took an active part in the Reformation, but fled to Germany, where he wrote his famous and influential satire, *Biencorff der H. Roomsche Kercke* (1569; German trans. by J. Fischart, 1580), apparently defending the Church of Rome but in reality ridiculing it. In 1571 he entered the service of William of Orange. He went on a mission to England, 1581–82; took part in the settlement of the Pacification of Ghent (1576); requested help for the Netherlands at the diet of Worms (1578); and in 1583 was made burgomaster extraordinary of Antwerp, which he had to surrender in 1585 to the duke of Parma. Disheartened, he retired to his castle, West-Souburg, in Walcheren, where he revised his fine translation of the Psalms from the Hebrew (1st ed. 1580; 1591). In 1594 he was entrusted with the translation of the Bible, but only completed Genesis and the Psalms. He also adapted his *Biencorff* as a *Tableau des Différends de la Religion* and wrote essays on politics and religious polemics. The words of the *Wilhelmus*, the Dutch national anthem, are attributed to him, but his authorship has not been proved. He died in Leiden on Dec. 15, 1598.

MARONI (Dutch: MAROWIJNE), a river forming the boundary between Dutch and French Guiana, South America, rises in the Tumuc-Humac mountains and flows 450 mi. mostly through tropical forest to reach the Atlantic about 18 mi. below Albina and Saint-Laurent. Its upper course is called the Itani in French and Litani in Dutch and its middle course the Aoua or Lawa. Moderate-sized vessels can reach Saint-Laurent. Gold placer mining is conducted on a small scale along the Lawa but the basin is otherwise undeveloped. The river's chief tributary is the Tapanahoni from the southwest. (G. L.N.)

MARONITES (AL-MAWARINAH), Roman Catholics following the Syro-Antiochene rite, form the most numerous religious community of the republic of Lebanon (*q.v.*). Their immediate spiritual head under the pope is the Maronite patriarch, residing in Bkirki near Beirut, the capital of the republic; his title is "patriarch of Antioch and all the east." The name of the group derives from two historical figures, the first an influential Syrian solitary of the late 4th and early 5th centuries, called St. Maron (d. c. 423). At his tomb a monastery was built near Apamea on the Orontes. Because of persecution from the Jacobites, the monks transferred the monastery to more remote Lebanon, where it became the dynamic religious centre of the region. According to Maronite legend, a later monk of this community, St. John Maron, became patriarch of Antioch in 685–707 and the father of the Maronite nation. The tradition is uncritical, though St. John Maron may well have been an energetic patriotic bishop of Lebanon. The Maronites, hardy, martial mountaineers, have always valiantly preserved their liberty and folkways. The Muslim empire could not absorb them, and two Omayyad caliphs paid them tribute. Under John Maron they became a fully independent people after routing the invading Byzantines of Justinian II in 694.

According to Maronite tradition, the Maronites were always orthodox Christians in union with the Roman see, but the best evidence indicates that for centuries they were Monothelites (*q.v.*), following the heretical doctrine of Sergius, patriarch of Constantinople, who affirmed that there was a divine but no human will in Christ. According to the medieval bishop William of Tyre, the Maronite patriarch sought union with the Latin patriarch of Antioch in 1182. At this time the Maronites were certainly close friends and allies of the French crusaders, and an unstable union with Rome at this early date is most probable. At all events, a definitive consolidation of the union came in the 16th century, thanks in great part to the work of the Jesuit John Eliano. In 1584 Pope Gregory XIII founded the Maronite college in Rome, which still flourishes under Jesuit administration. In this centre great scholars and leaders were trained, of whom the most distinguished were the four Assemani (al-Sam'ani), two brothers and their two nephews, who worked in the 18th century.

During the days of the Ottoman empire the Maronites, largely unhampered because of their isolation, maintained their religion and customs under the protection of France. In the 19th century the Turkish government incited the neighbouring Druze (*q.v.*) to harass the Maronites. This policy culminated in the great Maronite massacre of 1860, and as a result of this tragedy the Maronites achieved formal autonomy within the Turkish empire under a non-native Christian ruler. After the downfall of the Ottoman empire, the Maronites of Lebanon along with Syria became self ruling in 1920 under French protection. In 1944 the fully independent republic of Lebanon was established. Other religions in addition to that of the Maronites exist in the republic, but the president is always a Maronite.

The language of the Maronites is Arabic but their liturgical tongue is West Syriac. The Maronite cultural centre is the University of St. Joseph, conducted by French Jesuits at Beirut. There are nearly 400,000 Maronites in Lebanon and Syria, and 15,000 live in Egypt, Israel and Jordan.

Under the pressure of the persecutions of the 19th century, the

Maronites began to emigrate from the near east in great numbers, and as many as 475,000 can be found in the lands of southern Europe and in North and South America. The *émigrés* keep their own liturgy and have their own clergy (some of whom are married), but are subject to the local Latin-rite bishops who work in collaboration with the Maronite patriarch, who remains the true head of the dispersed congregations.

MAROT, CLÉMENT (1496–1544), one of the greatest poets of the French Renaissance, was born at Cahors in the province of Quercy, probably in 1496. (See **FRENCH LITERATURE: The 16th Century: Poetry.**) His father, Jean Marot, was a poet of the *grands rhétoriciens* school of poetry and left Cahors with his son to take up a post at the court of Anne of Brittany. Later he became *valet de la garde-robe* to Francis I.

Little is known of Clément Marot's youth except for some references found in his poetry. It appears that his education was not very good. In 1514 he became page to Nicolas de Neufville, seigneur de Villeroi, secretary to the king, and at the same time seems to have worked as a clerk in the department of justice, the normal way for boys of bourgeois families to prepare for a career in the civil service. About 1515 he appears to have begun to write poetry. Soon he wished to follow in his father's footsteps by obtaining a place as court poet. In 1519 he entered the service of Margaret of Angoulême (*q.v.*), duchess of Alençon and later queen of Navarre, sister of Francis I and one of the most remarkable women of the Renaissance, herself a poet and novelist of stature who, during the whole of her life, protected fellow-poets, philosophers and religious reformers. He remained in her service until 1527 when, on the death of his father, he obtained the post of *valet de chambre* to Francis I, which, apart from the interruption of the years of his first exile (1534–36), he was to retain until his second exile in 1542.

In 1526 Marot, because of eating meat in Lent, which at that time was an indication of Lutheranism or at least of strong objection to the Roman Catholic Church, was arrested on a charge of Lutheranism and imprisoned in the Châtelet. He was not tried, however, but released in somewhat obscure circumstances after a few weeks. This episode inspired some of the poet's best-known works, especially "L'Enfer," an allegorical account of his imprisonment containing a violent satire on justice, as well as the famous "Épître à son amy Lyon" (1526). In 1527 he was again put into prison, this time for having freed an unknown prisoner by attacking his guards. He appealed to the king in another famous epistle "Marot, Prisonnier, escript au Roy pour sa délivrance" (1527) and was released by his orders. Early in 1531 the *parlement* of Paris ordered his arrest for again eating meat in Lent, no doubt a trumped-up charge. He was, however, saved from prison through the intervention of Margaret of Angoulême and of her husband, Henry II, king of Navarre.

About this time his fame was firmly established and his many poems seemed to have enjoyed a wide circulation. In Aug. 1532 he published a collection under the title *L'Adolescence Clémentine*. Toward the end of 1533, probably, he published a second collection, *La Suite de l'adolescence Clémentine*.

In Oct. 1534, on the morning after the *Affaire des Placards* (see **FRANCE: History: Francis I; REFORMATION**), when posters violently attacking the Catholic Church were fixed on the walls of the principal towns of France and on the very door of the king's bedchamber, Marot fled and made for the kingdom of Navarre where Margaret was then in residence. On the way he was recognized in Bordeaux and arrested, but managed to escape. He found refuge with Margaret during the winter but in the spring she felt powerless before the intensification of the persecution of the Protestants ordered by the king, and advised Marot to leave. He fled to Ferrara where he was received by the duchess, Renée of France, sister-in-law of Francis I, and obtained a post as her

secretary. Renée, a woman of great culture and an ardent Protestant, protected a number of French Lutheran refugees and Marot seems to have felt happy at her court. Some of his finest poems date from his stay at Ferrara. However, early in 1536, Renée's husband, Ercole II d'Este, rigidly orthodox and wishing to free himself from his alliance with France, ordered the expulsion of practically all Renée's French entourage, and the Inquisition of Ferrara took up proceedings against Marot and other Lutherans. Once again the poet fled, this time to Venice, where he spent the summer and autumn of 1536.

During his stay in Venice he attempted, successfully, to obtain permission to return to France, where Francis I, in two edicts, had put a stop to the persecution of Protestants. In Dec. 1536 Marot crossed the Alps, arriving at Lyons shortly before Christmas. There he was forced to abjure his errors publicly. He then went to Paris and in March 1537 rejoined the court. Apart from official poems which his duties compelled him to write, most of his time from then on seems to have been taken up with a translation of the Psalms, of which a first edition was published in 1539.

In the autumn of 1542 renewed severity toward Protestants was decided upon and it was, no doubt, to escape from fresh persecutions that the poet again fled. This time he went to Geneva, where John Calvin received him warmly, hoping that he would complete his translation of the Psalms. The *Conseil de la Ville*, however, refused to grant the poet a pension and after staying for about a year, Marot left Geneva and went to Savoy where he stayed with a number of the local gentry. In 1544, the presence of a French army in Piedmont under the young duke of Enghien probably gave Marot the hope of returning to France under Enghien's protection. In the summer he went to Turin but died there in Sept. 1544.

His translation of the Psalms was condemned by the Sorbonne, and his whole work was placed on the first Index Librorum Prohibitorum (*q.v.*) published by Pope Paul IV in 1557.

Reputation and Poetic Status.—Although Marot's poetry never lost favour and was constantly admired for its ease, elegance and wit, Marot's real importance has never been quite recognized, mainly because the *Pléiade* (*q.v.*), coming on the scene within a few years of his death, claimed and obtained the credit for most of the innovations introduced by him. Yet it is Marot who has influenced the whole course of French poetry by judicious imitation of the *genres* and themes of antiquity. Though his first compositions were entirely in the style of the *rhétoriciens*, he soon gave up not only the set genres of the school, but also its mannerisms, its abuse of allegory and its complicated versification. He introduced the elegy, the eclogue, the epigram and the epithalamium. Moreover, from his youth onward, he attempted to create a new lyrical genre, composing a number of *chansons* and later several *cantiques*. These attempts led to his translations of the Psalms in which he created the lyrical metres which Ronsard was to use in his Pindaric odes. He imitated Catullus, Virgil and Ovid and was the first French poet to use extensively the imagery of Latin poetry.

BIBLIOGRAPHY.—A critical edition of Marot's works by C. A. Mayer was begun by *Les Épitres* (1958), *Oeuvres satiriques* (1962) and *Oeuvres lyriques* (1964). Otherwise the only comparatively complete modern edition is by G. Guiffrey, completed by J. Plattard, 5 vol. (1875–1931). On 16th-century editions see C. A. Mayer, *Bibliographie des oeuvres de Clément Marot*, 2 vol. (1954). See also P. Villey, *Les grands écrivains du XVI^e siècle, Marot et Rabelais* (1921); H. Guy, *Clément Marot et son école* (1926); P. A. Becker, *Clément Marot, sein Leben und seine Dichtung* (1926); J. Plattard, *Marot, sa carrière poétique et son oeuvre* (1938); P. Jourda, *Marot, l'homme et l'oeuvre* (1950); C. A. Mayer, *La Religion de Marot* (1960). (Cl. A. M.)

MAROT, DANIEL (1661–1752), architect, engraver and decorative designer, was trained under his father, Jean Marot (*q.v.*), in his native Paris. He was a Protestant and retired to Holland in 1684, thereby anticipating the revocation of the Edict of Nantes. He entered the service of the stadholder, the prince of Orange, for whom he designed the audience chamber at The Hague (1686), as well as apartments and gardens at the new palace of Het Loo (*c.* 1692); he also worked for private Dutch clients. In 1694

he followed his master, now William III, to England and henceforward often introduced the royal arms and cipher into his engraved designs. In the frontispiece to his collected works he is styled *Architecte de Guillaume III*, but if he received any official appointment it was as intendant of the royal gardens only. He certainly provided several designs for the east parterre at Hampton court, and was probably consulted about the interior decoration and furniture also, though his pay seems to have been borne on Dutch, not English, funds. A group of delftware tulip vases, milk pails and tiles bearing the royal insignia, some of which survive, appear to have been made for Hampton court after his designs, and a state coach for William III was constructed at The Hague to Marot's design. He returned to Holland about 1698 and until his death (at The Hague, June 4, 1752) continued to work for the stadholder's family, notably at Slot Oranienstein, in Friesland, and in the Huis ten Bosch. His later work for private patrons at The Hague included the houses of the Fagel, Van Schuylenburch and Van Wassenaer families, the present royal library and the Portuguese synagogue.

His numerous engraved designs for furniture, silver, textiles, interior decoration, etc., in an opulent and often fantastically elaborate style, exercised a widespread influence. As a record of contemporary fashions, particularly of the beginnings of the European taste for oriental motifs, they are invaluable. Although Marot's style derives in some degree from Jean Lepautre and J. Bérain (*q.v.*) it contributed nothing to the formation of the Louis XIV style in France itself, but is rather a Dutch variant of that style.

Lane, "Daniel Marot as Designer of Delft Vases and of Gardens at Hampton Court," *The Connoisseur*, p. 19 (March 1949); O. Millar, "The William and Mary Exhibition," *Burlington Magazine*, p. 234 (Aug. 1950). (F. J. B. W.)

MAROT, JEAN (c. 1619–1679), French architect and engraver, was one of a large family of Parisian craftsmen and artists. He was architect of various private houses, including the Hôtels de Pussort, de Mortemart and de Monceau, but he is chiefly retained for his two great series of architectural engravings known as "Le Petit Marot" and "Le Grand Marot," essential for the study of French 17th-century architecture. In addition he engraved a large number of ornamental designs for chimneys, ceilings, etc., a practice in which he was followed by his son Daniel Marot (*q.v.*). He died in Paris, Dec. 15, 1679. (F. J. B. W.)

MARPECK (MARBECK), PILGRAM (c. 1490–1556), the outstanding 16th-century South German Anabaptist leader and writer (see ANABAPTISTS), was born at Rattenberg in the Inn valley of Tirol. By profession an engineer, he served first as a mining judge at his home town, whence he was expelled in 1528 as an Anabaptist, then as an engineer of water works for the cities of Strasbourg (1528–31, until his expulsion) and Augsburg (1544–46), where he died.

In Strasbourg he emerged as a vigorous Anabaptist leader, at first in close touch with the reformers Martin Bucer, Wolfgang Capito and Zell, with whom he had numerous theological discussions. Marpeck's three major theological works and two small pamphlets, with a total of over 2,000 pages, place him in the ranks of the top Anabaptist writers with the Dutch Menno Simons (*q.v.*) and Dirk Philips and the Hutterite Peter Riedemann. Two of these books, the *Vermahnung* (printed in 1542) and the *Verantwortung* (written in 1544–50 but never printed), both written in collaboration with Leupold Scharnschlager, arose out of his controversy with the spiritualist Kaspar Schwenckfeld. The Anabaptist group led by Marpeck, sometimes called Pilgramites, was never large and was absorbed into the Swiss Brethren about the middle of the 16th century. See also MENNONITES.

MARPRELATE CONTROVERSY, the most famous Elizabethan pamphlet war. From the autumn of 1588 to the summer of 1589 there were secretly printed (by Robert Waldegrave) at least seven tracts, the author being described as "Martin Mar-

prelate gentleman" (or, on one occasion, as his younger brother, "Martin junior"). The tracts appeared at the point when John Whitgift (*q.v.*; archbishop of Canterbury since 1583) was effectively silencing Puritanism by his rigorous use of the court of high commission and control of printing. They were Puritan attacks on episcopacy in general and on certain bishops in particular: "profane, proud, paltry, popish, pestilent, pernicious, presumptuous prelates." They do not seem, however, to have been in touch with the main trend of Puritanism, for they failed to win the support of the movement's leaders. The English invective was exceptionally vigorous and racy, improving on such earlier masters of rude rhetoric as the Reformers John Bale, Hugh Latimer and Thomas Becon, and the Separatist Robert Browne.

The seven surviving tracts are: *Epistle and Epitome*, being the two parts of *Oh read over D. John Bridges* (Bridges was dean of Salisbury and author of *A Defence of the Government established in the Church of Englande*, 1587); *Certaine minerall and metaphisicall school-points, to be defended by the reverende byshoppes*; *Hay any worke for Cooper* (Thomas Cooper was bishop of Winchester); *Theses Martinianae, that is, certaine demonstrative conclusions*, by Martin junior; *The just censure and reproofe of Martin junior, by Martin senior*; and *The Protestation of Martin Marprelat*. The secret presses moved from Molesey (near Kingston-upon-Thames) to Fawsley house (near Daventry, Northamptonshire), to Worcestershire, Coventry and Manchester. When the press was discovered by government agents, the tracts ceased (1589).

The authorship was, and remains, a mystery; probably more than one writer was involved, under the sponsorship of some Puritan peer. Claims were made at the time and later for John Udall, John Field, Henry Barrow and a certain Sir Roger Williams (Fluellen in Shakespeare's *Henry V*); and, more convincingly, for Job Throckmorton and John Penry (*q.v.*). Whitgift thought Penry was the author. C. S. Lewis has written that Martin "displayed a new manner in controversy, and probably his successors learned from him. It can hardly be claimed that in this new kind he attained excellence. He seems at times a little tired of it himself. He is not best when he is rowdiest. I believe a quieter and more ironic prose, a prose closer to Swift's, would have been more congenial to him" (*English Literature in the Sixteenth Century*; Oxford University Press, 1954). Martin's successors among anti-episcopal pamphleteers included John Milton.

The Marprelate tracts occasioned replies. Of those printed (anonymously) in 1589, some are sometimes attributed to Thomas Nashe (including *An almond for a parrat, or Cuthbert Curry-knaves almes*, and *Mar-Martine*). Some have been attributed to John Lyly, including *Pappe with an hatchet* and *A Whip for an ape, or Martin displayed*. Again, the attribution is not proved. The tracts were attacked in Feb. 1589 at Paul's Cross, London, by Richard Bancroft (*q.v.*) in a sermon usually considered as the first statement of the "divine right" of episcopacy in Anglican apologetic.

MARPURG, FRIEDRICH WILHELM (1718–1795), German composer and writer on music, was born on Nov. 21, 1718, at Marpurgsdorf, near Seehausen, Brandenburg. Nothing is known of his musical training but in 1746 he is heard of as secretary to a Prussian general in Paris, where he met Voltaire, J. d'Alembert and J. P. Rameau. Later he lived in Berlin and Hamburg, and from 1763 to 1795 he was director of the Prussian state lottery. Although he composed various pieces for the harpsichord, it is as a theoretical and critical writer on music that he is best remembered. Such works as the *Historisch-kritische Beyträge* (Berlin, 1754–78) and his various introductions (*Anleitungen*) to different branches of the art, of which perhaps his *Abhandlung von*

der Fuge (Berlin, 1753–54) is the most important, are still of great interest to students of 18th-century music theory and practice and contain much valuable historical information. Marpurgh's published compositions include *6 Sonaten für das Cembalo* (1756) and *Fughe e caprice* (1777). He died in Berlin on May 22, 1795. (Cs. CH.)

MARQUAND, JOHN PHILLIPS (1893–1960), U.S. novelist noted for his satirical yet sympathetic portrayals of a crumbling New England gentility, was born in Wilmington, Del., Nov. 10, 1893, and graduated from Harvard university in 1915. After about 15 years devoted to writing popular fiction, including the widely read adventures of the Japanese detective Mr. Moto, Marquand turned to his New England studies, his first novel in this vein being *The Late George Apley* (1937), which won a Pulitzer prize. *H. M. Pulham, Esquire* (1941) developed a similar theme, with the conforming Bostonian renouncing romantic love for duty. Other titles deserving specific mention are *Point of No Return* (1949), *Melville Goodwin, U.S.A.* (1951) and *Sincerely, Willis Wayde* (1955).

Somewhat an anomaly among modern American writers, Marquand achieved a mass audience as well as respectful critical attention. During 40 years as a professional writer, he published 25 novels and historical studies, collaborated on adaptations of two of his novels for the theatre and wrote dozens of short pieces. In his major work he was a superb reporter of the shifting social patterns in American life and a chronicler of social status seeking among the lower upper class. Marquand died at his home in Newburyport, Mass., July 16, 1960. (J. J. GR.)

MARQUESAS ISLANDS: see FRENCH POLYNESIA.

MARQUESS or **MARQUIS**, a title and rank of nobility. Etymologically the word has the same meaning as margrave (*q.v.*), denoting a count or earl holding a march or mark, that is, a frontier district; but this original significance has long been lost.

In England the Late Latin term *marchiones* (plural) was early applied to the lords of the Welsh marches (see MARCH, EARLS OF); but it was there used in a sense descriptive only of their lordships' location near the frontier without implying that they were superior to other earls. On Dec. 1, 1385, however, Robert de Vere, 9th earl of Oxford, was created marquess of Dublin with precedence between dukes and earls; the other earls resented this creation, and the patent of the marquessate was revoked on Oct. 13, 1386, after its holder had been created duke of Ireland. John Beaufort, earl of Somerset, was created marquess of Dorset and marquess of Somerset on Sept. 29, 1397, but he was degraded to his former earldom on Nov. 3, 1399. When the commons petitioned for his restoration as marquess of Dorset in 1402, he objected because of the strangeness of the term in England. On June 24, 1443, however, his son Edmund Beaufort was raised to be marquess of Dorset, after which the title retained its place in the peerage. As earlier creations became extinct or were raised to dukedoms, the premier marquessate of England in the 20th century was that of Winchester, created on Oct. 11, 1551.

A marquess has precedence next after a duke, is "most honourable" and is styled "my lord marquess"; his mantle of parliament is scarlet, with three and a half double linings of ermine; his coronet is worn at coronations. The wife or widow of a marquess, or a lady holding in her own right the position equal to that of a marquess, is a marchioness.

In western Europe the Carolingian *marchiones* or margraves had been royal officials whose duty of defending a frontier might justify an exception's being made to the normal rule that no count should hold more than one countship or county. Their authority was thus not much less than that of a duke (*q.v.*); indeed the term *Markherzog* is occasionally found instead of *Markgraf*. But as conditions on the frontiers or the frontiers themselves were changed, the special importance of the old marches diminished.

In France, as the great feudatories' power grew at the expense of the king's, the old *marquisats* were practically lost in the great duchies or countships. Then, with the multiplication of little fiefs, minor counts holding several such lordships took to assuming the style of marquis to distinguish themselves. The kings indeed were very chary of erecting *marquisats*; that of Trans in Provence,

raised from *baronnie* in 1505 for Louis de Villeneuve, is reckoned as the *premier marquisat de France*. Moreover the rank of marquis, always inferior to that of a duke, was in a controversial relation to that of a count. Sometimes a count's nobility was better established and his fief greater than that of any marquis; sometimes a marquis with a royal patent should obviously have precedence. These ambiguities served to bring the title into disrepute in the 17th and 18th centuries, as being too often self-made or pretentious; and after the Revolution had abolished it Napoleon did not see fit to revive it. Louis XVIII, reviving it after the Restoration, gave its holders definitive precedence between dukes and counts.

In Italy the mark (*marca*, plural *marche*) long survived as a major territorial unit, though the original Carolingian demarcations were considerably altered. By the 14th century, however, barons and *signori* had begun to erect their fiefs into *marchesati*, after which the title grew to have much the same fate as the French *marquisat*.

In Spain the remnant of the original *Marca Hispanica* was merged in the countship of Barcelona. The first Castilian *marquesado* was that of Villena (on the Valencian frontier), created for Don Alonso of Aragon in 1376; the Pacheco family, who acquired it from the crown in 1445, subsequently became dukes of Escalona. The next senior *marquesado* was that of Santillana (1445).

MARQUETRY, a form of decorative woodwork in which pieces of thin wood or other materials (including ivory, bone, brass and other metals, tortoise shell and mother-of-pearl), combined to form a design, are veneered to a surface. Marquetry differs from true inlay in that the entire surface is covered, whereas with inlay, pieces are set in the surface. For a full discussion of the techniques of marquetry and its history see WOODWORK, DECORATIVE.

MARQUETTE, JACQUES (PÈRE MARQUETTE) (1637–1675), French explorer and Jesuit missionary priest who with Louis Jolliet traveled down the Mississippi river in 1673 and reported the first accurate data on its course. He was born in Laon, France, on June 1, 1637, and entered the Society of Jesus at Nancy at the age of 17. He was ordained to the priesthood at Toul on March 7, 1666, and arrived at Quebec on Sept. 20 of that year. He founded two missions which have given their names to towns in Michigan: Sault Ste. Marie (1668) and St. Ignace (1671). While at Holy Spirit mission (Ashland, Wis.), 1669–71, Indians from Illinois invited him to come to their territory. Hence, when Governor Frontenac commissioned Jolliet's Mississippi expedition in the autumn of 1672 Jolliet asked Marquette to go along. Leading a party of five Frenchmen, Marquette and Jolliet left St. Ignace in canoes in the spring of 1673. They coasted westward into Green Bay and ascended the Fox river to a portage (Portage, Wis.) that crossed to the Wisconsin river. On June 17 they entered the Mississippi river (about three miles south of Prairie du Chien, Wis.). On July 17, near the confluence of the Arkansas river, apprehending Spanish hindrance, they turned homeward. They visited the Illinois Indians along the Illinois river and thence, by the Chicago portage reached Lake Michigan.

A year later, in failing health, Marquette returned to the Illinois Indians to found his third mission, Immaculate Conception (T'ca. Ill.). Caught by winter, he and two French companions built a cabin on the site of Chicago, thus becoming the first white men to live there (Dec. 4, 1674–March 30, 1675). Sickness forced him to abandon the mission in April 1675. He and his companions directed their course toward St. Ignace, following the east shore of Lake Michigan. At a river that now bears his name he died (Ludington, Mich.) on May 18, 1675. Two years later his bones were transferred to St. Ignace.

BIBLIOGRAPHY.—Carlos Sommervogel, *Bibliothèque de la Compagnie de Jesus* (1890–1898); R. G. Thwaites (ed.), *The Jesuit Relations and Allied Documents* (1896–1901, reprinted 1959), vol. 59 and 60 make contemporary narratives available, while vol. 71 has a good bibliography. (R. N. H.)

MARQUETTE, a city and port of the upper peninsula of Michigan, U.S., and seat of Marquette county, surrounded by rugged hills, is located on Lake Superior in a summer and winter resort area, about 400 mi. N. of Chicago.

Established in 1849 as Worcester, it was the first shipping point on the lake for the iron ore, pig iron and lumber of the region. It was renamed in 1850 for Father Jacques Marquette, the Jesuit missionary-explorer, incorporated as a village in 1859, was largely destroyed by fire in 1868 but rapidly rebuilt, and chartered as a city in 1871.

A city commission form of government was established in 1914 and a city-manager form was adopted in 1946.

Marquette is still an important ore shipping centre with railroad shops and impressive docks. Other industries include chemicals, foundry products, mining machinery, wood products and foods. It is the home of Northern Michigan college (1899, state supported) and Michigan State Branch prison (1885), and is a Roman Catholic diocesan centre (St. Peter's cathedral). Presque Isle, within the city, is a 328-ac. natural park deeded to Marquette by the U.S. government in 1886. Sugar Loaf mountain, K. I. Sawyer air force base and Cherry Creek fish hatchery are nearby. For comparative population figures see table in MICHIGAN: Population. (K. B.)

MARQUINA, EDUARDO (1879-1946), Spanish poet and dramatist, was born in Barcelona, Jan. 21, 1879, and died in New York, Nov. 21, 1946. Curiously disengaged from the vicissitudes of contemporary thought and expression, he devoted his considerable gifts as narrative and dramatic poet to celebrating the traditional glories and virtues of Spain (altar, throne, valour, chivalry) in the days of its greatness and empire, in resonant uncomplicated verse (*Tierras de España*, 1914; *Vendimión*, 1908). Among his many plays some of the best are *Las hijas del Cid* (1908), *En Flandes se ha puesto el sol* (1910), *Teresa de Jesus* (1932) and *La Santa Hermandad* (1937).

See his *Obras completas*, ed. by S. Aguilar, 7 vol. (1944).

(R. F. B.)

MARQUIS, DON (DONALD ROBERT PERRY MARQUIS) (1878-1937), U.S. poet and playwright, creator of Archy and Mehitabel, was born in Walnut, Ill., July 29, 1878, and educated at Knox college, Galesburg, Ill.

Marquis worked as a reporter on several newspapers and assisted Joel Chandler Harris in editing the *Uncle Remus* magazine. From 1912 to 1922 he conducted a column, "The Sun Dial," in the *New York Sun*, and in it first appeared that extraordinary pair of creatures, Archy the cockroach and Mehitabel the cat. Archy's poetic reflections on the world as seen "from the under side" and Mehitabel's racy misadventures were combined in a unique record, part whimsical, part bitter, wholly philosophical. Among Marquis' published collections of humorous poetry, satirical prose and plays are *Danny's Own Story* (1912), *Dreams and Dust* (1915), *Hermione* (1916), *The Old Soak* (1921), *Sonnets to a Red Haired Lady* (1922), *The Dark Hours* (1924), *Out of the Sea* (1927) and *Archy and Mehitabel* (1927). Marquis died at Forest Hills, N.Y., on Dec. 29, 1937, after a long illness.

MARR, NIKOLAI JAKOVLEVICH (1865-1934), Soviet linguist, archaeologist and philologist whose area of specialty was the Caucasus, was born on Jan. 6, 1865, at Kutais. In 1930, he was elected vice-president of the Academy of Sciences of the U.S.S.R. Marr's substantial achievements in Caucasian archaeology and philology have been obscured by his notorious linguistic theories. He postulated a stage development (corresponding to Marxist economic stages) of all the world's languages from an original word stock of four elements: *sal*, *ber*, *yon* and *rosh*. He died on Dec. 20, 1934, at Leningrad.

See L. L. Thomas, *The Linguistic Theories of N. Ja. Marr*, University of California Publications in Linguistics, vol. 14 (1957).

(L. L. T.)

MARRAKESH (MARRAKECH), the chief city of southern Morocco and the second in the kingdom, capital of Marrakesh province. In the centre of the Haouz plain, the city lies just south of the Tensift wadi and about 25 mi. N. of the snowcapped High Atlas mountains. By road it is 150 mi. S. of Casablanca. Pop. (1960) 243,134.

Marrakesh has a mild dry climate from November to April but becomes extremely hot in summer. The city is divided into two parts: the medina, or ancient Moorish town; and the modern

French-built quarter west of it. The medina, surrounded by a palm grove yielding coarse dates, is enclosed by ramparts about 8 mi. long and 16 ft. high made of reddish clay, of which most of the houses are also built. The heart of it is the Place Djemaa Al Fna, a vast square with market stalls and booths, and enlivened by acrobats, storytellers, snake charmers and dancers. North of the Place is the crowded souk, or market quarter, and just west of it the 12th-century Koutoubia mosque, whose 220-ft. minaret decorated with turquoise-blue mosaics dominates the town. Other notable buildings include the late-19th-century Bahia ("the brilliant") palace; the Dar Si Said, a palace converted into a museum of Moroccan art; the Université Ben Youssef (traditional Islamic studies); and the necropolis of domed mausoleums built in the late 16th century to enshrine the tombs of the Sa'adi rulers. South of the medina the Aguedal gardens, surrounded by high walls, cover about 1,000 ac. and are planted with olive and fruit trees. The French-built part of the city dates from 1913. It is known as the Gueliz after the Jabal Gueliz (1,728 ft.) rising north of it; and is laid out in wide streets most of which are lined with trees.

Apart from local crafts Marrakesh is little industrialized and is, like Fès, a regional centre which did not share the development of the coastal Moroccan towns in the first half of the 20th century. It is, however, a popular centre for tourism and for winter sports in the High Atlas. The city is the terminus of the railway from Casablanca and is linked by scheduled air services with Casablanca, Fès and Agadir. Regular automobile services connect with Essaouira (formerly Mogador, 109 mi. W.) and other centres; there are local bus services.

History—Marrakesh, misnamed Morocco by Europeans, gave its name to the kingdom of which it was for long the capital. It was founded in 1062 by Yusuf ibn Tashfin of the dynasty of the Almoravids (*q.v.*), and served as the Almoravid capital until it fell to the Almohads (*q.v.*) in 1147. In 1269 it passed to the control of the Marinids, whose preferred capital was Fès. Although Marrakesh was embellished by the Sa'adians in the 16th century, the succeeding Alawid rulers (see FILALI) resided more often at Fès or Meknès. In 1912 Marrakesh was captured by the Saharan insurgent al-Hiba, who was defeated and driven out by French forces commanded by Col. (later Gen.) C. M. E. Mangin (1866-1925). Under the French protectorate (1912-56) Marrakesh was for many years administered by the Glaoui family, the last of whom, Haj Thami al-Mezuari al-Glaoui, celebrated for his pomp, was the chief instigator of the deposition of sultan Mohammed ben Yusuf (Mohammed V) in 1953.

MARRAKESH PROVINCE had a population of 1,990,808 in 1960. It extends from the High Atlas northward to the Chaouia region of Casablanca province, and from Essaouira in the west to the Beni Mellal province in the east. The economy is chiefly agricultural. It is divided administratively into the *cercles* of Abda, Ahmar, Ait-Ouir, Amizmiz, Essaouira, Imi-N-Tanoute, Marrakesh Banlieue, Rehamna and Srahna-Zemrane. (A. Am.)

Arin, *Les Tombeaux saadiens de Marrakech* (1925); P. Ricard and C. Bacquet (eds.), *Maroc*, 8th ed., pp. 123-152, in "Les Guides Bleus" series (1954); G. Deverdun, *Marrakech, des origines à 1912* (1959).

MARRAM GRASS, a common name for important sand-binding plants of the genus *Ammophila*, called also beach grass and sea marram, native to sandy seacoasts of Europe, Britain and North America from North Carolina northward and to the Great Lakes. They are erect somewhat coarse perennials, with hard, tough, scaly, creeping rootstocks; long leaf blades; and pale dense spikelike flower heads. The American species is *A. breviligulata*; in Britain and western Europe *A. arenaria* and *A. baltica* are found. Marram is employed in Europe to hold in place the barrier dunes along coasts, as in the Netherlands; also with like success on Cape Cod, Mass., at San Francisco, Calif., and in northern Indiana.

MARRANO, a derisive name meaning "swine," applied to crypto-Jews in Spain and Portugal who accepted baptism to escape massacre or expulsion but practised Judaism secretly.

In the late 14th century Spanish Jewry was threatened with extinction at the hands of mobs. Thousands of Jews accepted death,

but tens of thousands found safety at the baptismal font. The number of "saved" converts is moderately estimated as over 100,000. By the mid-15th century the persons who had been baptized but continued to practise Judaism in secret—marranos—formed a compact society. The marranos began to grow rich and to rise to high positions in the state, the royal court and the church hierarchy. They intermarried with the noblest families of the land. The hatred directed against them by the old Christians, ostensibly because they were suspected of being untrue to their converted faith, was in fact directed indiscriminately against all *conversos*, even those who became denounciators of Judaism and persecutors of Jews and marranos.

In March 1473 riots broke out in Córdoba, with pillage and carnage lasting for three days. The massacres spread from city to city, instigated by fanatical priests. The one institution that seemed adequate to deal with the marranos was the Inquisition, but so strong was the opposition to it that it was not until 1480, under the strong rule of Ferdinand and Isabella, that the Inquisition was finally introduced. In its first year, over 300 marranos were burned, their estates reverting to the crown. The number of victims grew into tens of thousands.

To the Jews, the marranos were pitiful martyrs. They were not renegades but *anusim*, "forced converts," Jews at heart, who could be trusted to escape from intolerable religious duplicity at the first opportunity. At grave danger to themselves, the Jews maintained religious bonds with the marranos and kept strong their faith in the God of Israel. By giving religious comfort to the *conversos*, however, the Jews also came under the surveillance of the Inquisition, which was finally convinced that only the total expulsion of the Jews could end the alliance. Purity of faith became the national policy of the Catholic sovereigns, and thus came about the final tragedy, the edict of expulsion of all the Jews from Spain on March 31, 1492. Portugal promulgated an edict of expulsion in 1497 and Navarre in 1498.

A considerable minority of Jews saved themselves from expulsion by baptism, thus adding strength and numbers to the marranos, but the mass of Spanish Jews went into exile. The physical separation of the marranos from their spiritual sympathizers, however, did not make them more amenable to inquisitorial discipline. The Jewish religion remained deeply rooted in their hearts and they continued to transmit their beliefs to the succeeding generations.

In Portugal, where the Inquisition was established in 1497, the same process was repeated. The Inquisition also followed the marranos to the Spanish and Portuguese dependencies in Latin America. It is difficult to estimate accurately the number of marranos who settled in Latin America in the centuries following the expulsion of the Jews from Spain and Portugal. A fair estimate of those who died at the stake in the Americas would be approximately 2,000; in addition, a far larger number was sentenced to whipping, incarceration or the galleys. It may be assumed that there was considerable assimilation of Jews in the general population; intermarriage with Indians was particularly noticeable in Mexico.

The more fortunate marranos emigrated to safer countries in North Africa and, on the European continent, to Holland and to Italy as temporary stations on the way to the Ottoman Empire. In Amsterdam the marranos openly avowed Judaism and established there a notable cultural centre. Other smaller marrano centres were established in Bordeaux, Hamburg and London. The first Jewish group that settled in North America (New Amsterdam, 1654) were religious refugees from the Portuguese colony of Brazil.

The decreasing number of marrano trials at the tribunals of the Spanish Inquisition during the 17th and 18th centuries indicates that marranism died out gradually and virtually disappeared a century before the Inquisition tribunals were abolished early in the 19th century. This was not the case in the Balearic Islands, where marrano descendants known as Chuetas ("swine") still persist as an isolated stigmatized community.

Marrano communities continue to linger in Portugal. Having been isolated from the Jews and the stream of living Judaism for centuries, they developed strange customs and religious beliefs, many of them alien to the faith of their fathers. Many Portuguese marranos still adhere to their rites and customs and resist the efforts

of Jewish communities to educate them in the traditional tenets of Judaism. See also INQUISITION.

MARRIAGE, as used in this article, is a legally and socially sanctioned union between one or more husbands and one or more wives that accords status to their offspring and is regulated by laws, rules, customs, beliefs and attitudes that prescribe the rights and duties of the partners. The universality of marriage within different societies and cultures is attributed to the many basic social and personal functions it performs, such as procreation and provision for sexual gratification and regulation, care of children and their education and socialization, regulation of lines of descent, division of labour between the sexes, economic production and consumption and provision for satisfaction of personal needs for affection, status and companionship.

The kinds of institutions and customs that a society develops to fulfill these functions depend on a number of characteristics, as size and complexity of the society, level of economic development, form of kinship system and the nature of economic, political and religious institutions. For example, the status of women affects the power that husbands have over wives; religious beliefs are related to attitudes about divorce and remarriage; the age of marriage and the economic role of wives is partly determined by the economic system; and social class boundaries define limits of eligibility for mate selection. For discussion of variations in marriage in different types of societies, see KINSHIP; MARRIAGE, PRIMITIVE; MARRIAGE, LAW OF. See also CONCUBINAGE; ENDOGAMY; EXOGAMY; EXCHANGE MARRIAGE; GROUP MARRIAGE; LEVIRATE; POLYANDRY; POLYGyny; articles on various cultures as ESKIMO; NAYAR; and SOCIAL ANTHROPOLOGY.

HISTORY

The institution of marriage as it appears in modern western civilization is the product of a long development in which Greek, Roman, Hebrew and Christian traditions were the main elements. At the time immediately preceding the rise of Christian notions of marriage, the Jews as well as the Germanic peoples had a type of marriage that at an earlier period appears also to have been that of the Greeks and Romans and that, indeed, was the type natural for a society based upon dominance of kinship groups headed by patriarchal chiefs. In an extreme way this type of social structure existed in the social system of early Rome and to some extent it can still be found among nomadic Bedouins of Iraq or Arabia. Every person, male or female, belonged of necessity to a clan (*q.v.*) dominated by a patriarch-chief. By marrying, a woman left the clan into which she was born and entered that to which her husband belonged, either as the chief or as a son, grandson or adopted son of the chief. Apart from the case of wife-stealing, no female member could be parted from her clan without the co-operation of her chief, and no male member could take a wife without the co-operation of his chief. Marriage thus was a transaction not between the two partners immediately concerned but between their respective chiefs. Furthermore, under this system, the idea that a marriage, by definition, was indissoluble was unknown: since the chief also had absolute power to expel any member of the clan, he could expel his own wife as well as the wife of a son or of any other member. The exercise of this power was restricted by the possible disapproval of an "improper" expulsion, by his own clan or by the clan to which the woman had belonged before her marriage. Thus the termination of a marriage, like its initiation, would frequently appear as a bargain between the chiefs of the two clans concerned. (Because expulsion could be expected if a woman had been discovered in unfaithfulness or simply if she was barren or had failed to bear a male heir, there has been a tendency, applying modern social concepts, to speak of adultery or barrenness as grounds for divorce: what they actually consti-

tuted in the different context of patriarchy were grounds to ensure social approval for a chief or, later, a husband, to exercise his power of expulsion.) Among the Jews of postexilic times, clans no longer regulated marriage, but the idea that a wife could be expelled at any time was not only kept alive but had become part of the divine law, and thus unalterable. Talmudic jurists, as those of modern Islamic countries, thus faced the tasks of subjecting the exercise of the power of repudiation to rabbinical control as well as of finding ways to compel a husband to exercise that power when necessary to free a wife from an unbearable marriage. As far as the "law" stood at the time of Jesus, a marriage could at any time be terminated arbitrarily by the husband, while no corresponding power whatever existed for the wife.

Among the Greeks and particularly the Romans, however, radical changes had occurred. In early Rome a marriage could be concluded by the parties going through the ceremony of either *confarreatio* or *coemptio*. Whether even in ancient days such a ceremony was absolutely necessary is not clear. From later republican times on it was unquestionably possible to initiate a marriage without any ceremony or at least without a ceremony prescribed or defined by law. It is probable that an event of such great significance as marriage was marked by some celebration of a religious kind and by a family feast. However, the relation of *matrimonium iustum* was initiated simply by the parties beginning to live together with the intention of being husband and wife (*afectio maritalis*). This free union moreover could be terminated by either party as freely as it could be entered.

Among the Greeks and hellenized orientals, who constituted the bulk of the population in the eastern parts of the Roman empire, the situation was more or less the same as among the Romans and the Germanic and other romanized peoples of the western parts. Marriage could be freely initiated and could be terminated without formality by either party and at any time.

Christian Church.—The situation generally prevailing in the ancient world was profoundly changed by Christianity. In the Christian tradition as it evolved, the sex relationship, in order to constitute marriage, must be monogamous, must be combined with a full community of life and must be characterized by the duty of faithfulness. At one time the union also had to be indissoluble and the doctrine of the indissolubility of marriage was given special dignity by its being combined with the dogma of the sacramental nature of marriage, which came to full elaboration in the 4th century through St. Augustine.

Through the doctrine of the sacramental nature of marriage, it was elevated to the level of being a vehicle of divine grace. (See SACRAMENT.) Marriage was thus endowed with the highest possible responsibility of the spouses to each other, to their offspring, and to the Lord. It was a sublime idea, but one that has been difficult for men to live up to. We do not know enough to say to what extent the realities of life have ever corresponded to the dogma. In evaluating its effectiveness one has to consider that it has long been accompanied by indulgence toward marital unfaithfulness of the male, and by toleration of prostitution and of the mistress system. In more recent times the duty of faithfulness in the sense of absolute disapproval of sexual intercourse with any person other than the marriage partner, long limited to the female party alone, has come to be applied to the male partner, too (see SEXUAL BEHAVIOUR).

The doctrine of indissolubility gained strength as the medieval church, slowly enough, succeeded in establishing its claim that only the ecclesiastical court was competent to decide a question pertaining to a sacrament, including the sacrament of marriage. Thus, whenever in a secular court it was necessary to determine whether or not a marriage existed, for instance, as a preliminary to the adjudication of claims to an estate, the secular court had to stay its proceedings and wait for the decision of the ecclesiastical court. Even so, the indissolubility of marriage was not firmly established as a dogma of the church, even in France, until about A.D. 900, and it would be interesting to know to what extent that dogma was offset by the enormous scope given toward the end of the middle ages to the impediments to marriage of consanguinity (blood relationship) and affinity (the spiritual relationship created by mar-

riage), the convenient discovery of which would allow the annulment of many an unhappy marriage. If Henry VIII had not sought and obtained papal dispensation for his marriage to Catherine of Aragon, he would have had little difficulty in having it annulled because of Catherine's prior marriage to his brother Arthur.

Formality of Marriage.—All during the middle ages the regulation of marriage was regarded as a task not of secular but of ecclesiastical authority. However, just as absence of any legal requirements of formality for the conclusion of a marriage was characteristic not only of Roman law but also of the laws of those Germanic peoples by whom the Roman empire was overrun, for many centuries the canon law did not require any marriage formalities either. The church, of course, desired, and later demanded, that an act of such deep religious significance as marriage should not be performed without the blessing of the church. It thus became customary that parties planning to be married, before entering upon their life in common, would meet at the door of the church, but outside of it (*in facie ecclesiae*), with the parish priest, who would then and there bestow upon them his blessing. The conclusion of marriage remained, however, the private transaction of the parties, consisting in the informal exchange of the expressions of their intentions from there on to be husband and wife (*sponsalia per verba de praesenti*). When followed by carnal consummation, this exchange of expressions of *consensus maritalis* would mature into the sacrament, and the marriage would thus become indissoluble. Such is still the law of the Roman Catholic Church under the Code of Canon Law of 1917.

The custom just mentioned of the marriage being blessed by the priest at the church door came to be established as a religious duty. A solemn pronouncement in that sense was particularly issued by the fourth Lateran council of 1215. However, violation of this command did not bring with it the invalidity of the marriage, but only ecclesiastical censure and punishment of the violator. A marriage ought not to be entered into informally, but if it was entered into in such way, it was a valid marriage nevertheless.

This state of affairs was not altered until the Council of Trent, which, in 1563, took the final step of requiring the celebration of marriage before the parish priest or the local ordinary (or a priest nominated by one of these) and in the presence of at least two witnesses as an essential requirement of validity. Informal as well as clandestine marriages have thus become impossible within the area of application of this *Decretum Tametsi*. However, this new pronouncement of canon law could apply only in those parts of the world which had remained faithful to the Church of Rome. Even in Catholic countries exceptions had to be made for overseas regions with difficult communications and of general wilderness character, regions, that is, in which it would not be easy to find a priest and a church. In certain parts of Latin America the *Decretum Tametsi* was thus not promulgated until centuries later. It had no effect whatever in countries that had split away from Rome, such as England.

The *Tametsi* decree was superseded by the decree *Ne Temere*, which came into force in 1908 and was later, with minor modifications, incorporated in canon 1094–1103 of the Code of Canon Law.

In England the pre-Tridentine canon law remained in effect, administered by the ecclesiastical courts of the Church of England. Informal or, as it came to be called, "common law" marriage, thus remained possible in England and Wales until it was outlawed in 1753 by Lord Hardwicke's reform of the marriage laws, under which it became necessary, for the conclusion of a valid marriage, to go through a ceremony in accordance with the rites of the Church of England after publication of the banns (see BANNS OF MARRIAGE). Since, with the exception of Quakers and Jews, the statute also applied to members of religious communities other than the Church of England, that is, to Protestant dissenters and to Roman Catholics, much hardship and resentment were created, until in 1836 marriage was rendered possible before ministers of religious communities other than the Church of England and before secular "registrars." However, the essential fact is that through Lord Hardwicke's reform the conclusion of informal marriages became impossible in England.

The reform did not apply to Scotland, and there informal mar-

riages remained possible until 1939. Lord Hardwicke's reform did not apply either to the English colonies beyond the seas. In the American colonies in particular, common-law marriages thus remained possible and for each colony or, later, for each state of the United States, that situation continued until by express statutory enactment a public ceremony would be established as an essential requirement for the validity of the marriage. Such statutes have now been enacted in most but by no means all of the U.S. states. At the beginning of the second half of the 20th century common-law marriage was still possible in Alabama, Alaska, Colorado, Connecticut, District of Columbia, Florida, Georgia, Idaho, Iowa, Kansas, Montana, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Carolina, South Dakota and Texas.

What is meant here is common-law marriage in the strict sense of a marriage of equal legal validity as a marriage formally celebrated and terminable in no way other than by death or divorce. This meaning must be distinguished from that in which the term common-law marriage appears in popular U.S. usage and in which it means a union between a man and a woman that is made outwardly to appear like a marriage, but in which the parties do not have the intention "really" to be married to each other, so that the term is used as a more polite word for concubinage.

Civil and Religious Ceremonies.—Marriage now being almost universally a formalized transaction requiring a public act or ceremony, there remains the question of what kind of act or ceremony shall be required, or, more specifically, whether the ceremony is to be a secular or a religious one. This problem of the *marriage civil* has engendered much heat and passion. In European and Latin-American countries it has constituted and still constitutes a topic of contention between church and state.

Before the 18th century marriage was clearly a religious affair in all countries of Europe. Only in New England in North America had it become possible to conclude marriages before secular officers, especially justices of the peace. In Europe civil marriage was conspicuously established by the French Revolution, which made it even compulsory in the sense that it would not be possible to conclude a valid marriage in any way other than by a ceremony before a secular officer, regularly the mayor of the city or village. From France the requirement of compulsory civil marriage spread to Belgium, Luxembourg, Switzerland and other countries. In Germany compulsory civil marriage was established in the course of Otto von Bismarck's struggle against the Roman Catholic Church, the so-called Kulturkampf. Needless to say that compulsory civil marriage is the rule in the Soviet Union and the several peoples' republics, although there the ceremony has been simplified into an act of registration by the officer of civil status.

The opposite position, under which a valid marriage cannot be concluded in any way other than by a religious ceremony, has almost disappeared. The rule was characteristic, before the modern revolutions, of the countries of the Orthodox Eastern Church, especially tsarist Russia, as well as in certain oriental countries. At present a compulsory religious ceremony seems to exist in Greece; in Israel, at least for Jews; in the Vatican City; and, curiously enough, in the U.S. state of Maryland. In that latter state the requirement is innocuous, however, because parties desiring a secular ceremony can easily have it performed in any neighbouring state.

Those countries that require a civil ceremony have, of course, not prohibited the performance of religious ceremonies. However, the religious ceremony is of no effect as far as the secular law is concerned and, in order to ensure the effectiveness of the state's command of a civil ceremony, it is regularly provided that the religious ceremony may not be performed until after the civil one. The minister who would perform a religious ceremony before the performance of the secular is liable to punishment.

In contrast to France on the one side and tsarist Russia on the other, the Anglo-American and Scandinavian countries have not seen any reason why parties to a marriage should be subjected to the compulsion of going through a ceremony that might be contrary to their convictions and desires. In all these countries parties may choose freely between a secular and a religious ceremony.

(M. RN.)

MARRIAGE AND FAMILY ORGANIZATION

In the industrialized, urbanized culture of the contemporary western world, the type of organization most commonly established by marriage is the small, nuclear family, consisting of a married couple and their children (see *FAMILY: Classification of Forms of Family Organization*). In many other countries, especially in the east, marriage is most commonly a part of the large, extended family system, in which the family may include parents, aunts, uncles, cousins, grandparents and possibly other relatives all living in the same household or at least having close and interdependent economic and social ties. This system, during the second half of the 20th century, has been in a state of revolutionary change.

There are a number of basic differences between the large, or extended, family system and the small, nuclear family system. In the extended family system marriages are arranged by the family, the assumption being that love comes after marriage, and thought is given to the socioeconomic advantages for the larger family; more value is placed upon having many children, especially boys; the man is recognized as head of the home and prestige and power often rest in the hands of the aged; many relatives are intimately acquainted since they may live and work together; and old or dependent members are cared for by the family. In contrast, in the nuclear family system children usually choose their own mates, it is assumed that love precedes marriage and less thought normally is given to socioeconomic aspects of a marriage contract; less value generally is placed upon numbers of children; there tends to be more equality in the home and age of relatives does not necessarily command prestige and power; the nuclear family may be isolated from other branches of the family; and old or dependent members may live alone or be cared for by the state.

In western countries emphasis has been placed upon romance and love as an essential prelude to marriage. The origin of the idea of love before marriage is obscure; it is not held in eastern countries and is, in fact, viewed with skepticism by many.

Arranged Marriages.—The majority of marriages throughout the world are arranged and partners do not do the choosing. In Africa, much of Europe and especially southeastern Europe, the near east and the orient, arranged marriages predominate.

In countries with arranged marriages the almost universal custom is that someone acts as an intermediary or go-between. The chief responsibility of the go-between (or matchmaker or marriage broker) is to arrange a marriage that will be satisfactory to the two families represented. Young people in these countries accept the view that their families should make the marriage choice for them.

The go-between is usually an older and respected person. He may or may not be related to the families involved and he may or may not be paid for his services. In some countries the older women in the family—aunts or grandmothers—act as go-betweens. After preliminary investigations have been made, the men of the two families may take over and conclude the financial and other arrangements for the marriage. From the first inquiries of the go-between to the final arrangements economic considerations are in the forefront. Some form of the dowry or dower (*qq.v.*) system or both are almost universal in countries having arranged marriages. The economic arrangements are such that both families are protected in case of a lasting marriage and in cases of divorce.

In Afghanistan the arrangements include a specific agreement on the financial settlement that would have to be made by the groom if the marriage should later fail. In Pakistan parents usually give their daughter a dowry but in turn the bridegroom often makes a settlement, called a dower, which is to be used by the wife in case the marriage is ended in divorce.

Communism theoretically eliminates the economic basis of marriage and of matchmaking; although local or national traditions and customs may persist to varying degrees, countries that have adopted communism have wiped out the foundation of arranged marriages and have substituted the free choice of individual marriage partners (see *MARRIAGE, LAW OF*).

The arranged marriage system functions best in stable, non-mobile societies where families know one another. Even in such societies, however, there have always been young people who, for varying reasons, have had difficulty in finding someone to act as go-betweens for them. The number of young people with this problem has been increasing because of the breakdown of the large family system. Young people move to the cities for work and are cut off from their families. Or they live in a small family in countries where most people still live in large family units. Under such conditions the matchmaker who operates for a fee becomes necessary for some. In cities of the east the Sunday editions of newspapers often contain advertisements for people interested in marriage. The matchmaker uses this method to find mates since he can no longer know all the families in the large city. In Japan young people who do not have anyone to sponsor them in marriage may register with their neighbourhood public official whose duty it is to help them arrange a marriage.

In almost all countries in which the pattern of arranged marriages predominates, some young people question the system. More and more young people think they should know their betrothed before marriage although few have come to the place where they would choose a mate without consulting their parents. In some countries a stage between individual selection of mates and parental selection has developed. In these countries the young people themselves first find someone whom they think they would like to marry and then consult their parents. If the parents approve, the young people are encouraged to go ahead and become acquainted, or the parents may help them to arrange the marriage. The greatest shift from arranged marriages to some other type came about after World War II in Japan, where previously all marriages had been arranged. A postwar study of university and high-school students there found that two-thirds of those responding thought marriage partners should be chosen by the parents and children working together. One-fourth of the students thought the young person should make his own choice of a mate. Only a small percentage thought the parents alone should choose mates for the children.

Dating and Courtship System.—The dating and courtship approach to marriage as it has grown up in western countries and especially as it has developed in the United States during the 20th century is an outgrowth of the way in which people in these countries view marriage. A successful marriage is viewed as one that brings personal satisfaction and happiness to the two people who marry. It is believed that happiness in a marriage is based upon many things such as mutual respect, sharing similar goals in life, companionship, similar moral and spiritual values, mutuality in sexual satisfaction and the meeting of psychological needs.

By the time young people in the United States have graduated from high school (at 16–18 years of age) three-fourths of the girls and more than half of the boys have had considerable experience in dating. Dating does not start at such an early age in other countries. In western Europe young people of high-school age in general do not date except possibly in a group. The pattern of pairing off does not usually take place until the young people are older and ready to consider marriage.

If dating served all of the functions it should serve, it might be considered an ideal system of mate selection in a society that places happiness of the individual couple as a paramount value. In actual practice the method leaves much to be desired. The high divorce rate in the western countries has caused some authorities to conclude that the dating-courtship system results in more unhappy marriages than result from marriages arranged by families. This may be a doubtful conclusion. The standards for successful marriage under the two systems are different. A successful arranged marriage is one that brings economic advantage and prestige to the family and produces children. Less value is placed on the quality of the husband-wife relationship.

The dating system may prove disastrous when copied by young people in cultures that have traditionally had arranged marriages. Increasingly, college students in countries around the world are breaking away from the custom of arranged marriages. In throwing overboard family traditions and in adopting a new system of

mate selection, however, they may not make as good marriages as their parents would have arranged for them. They are rebelling against arranged marriages but may not be prepared for individual selection of mates.

It must be noted that young people of eastern countries also often face great difficulty in the traditional arranged marriage. Many of the young men go to western nations for their college and professional training. They return to their countries and in many cases marry the girl chosen for them by their families. The wife so chosen may have a limited education. She may not feel at ease in mixed social functions since her social life would have been with women alone or with male members of her family only. Further, she would naturally play the rather well-defined role of the wife prescribed by her culture. The husband may have come to like the man-woman relationship he has observed in the west, the companionate relationship in marriage, the recognized equality of the sexes and the democratic type of family life. If he likes the western way as he has perceived it, he may be unhappy in the arranged marriage in his own country.

MARRIAGE EDUCATION AND COUNSELING

Widespread concern over high divorce rates in the western countries with, for example, reported increases in the 20th century of more than three times in England and Wales, France, Sweden and Switzerland, helped focus attention on marriage problems and stimulated efforts to strengthen marriage and family life. The International Union of Family Organizations, established in Paris in 1948, has been sponsoring a world family conference biennially and in alternate years it has sponsored smaller international seminars for intensive study of problems of the modern family. The approach differs between those countries in which the emphasis is upon strengthening the marriage relationship of the couple and those that focus upon the larger family. In the United States and to a certain extent in England the emphasis is upon programs to strengthen marriage through better understanding of the interpersonal relationships between husband and wife. Generally the approach in other countries is through social and economic benefits to strengthen the larger family units.

Marriage Education.—One approach to strengthening marriage in the United States has been through marriage education in the public schools. No other country has developed such a program, although other countries are becoming interested in such. Courses in preparation for courtship and marriage, many instituted at the request of students, were first given at the college and university level. After World War II there was a rapid expansion of university courses in marriage, the family, child development and marriage counseling. The increase in courses was in part due to the alarm over the increase in divorce among North Americans after World War II. In a few colleges a course in preparation for marriage was made a requirement for graduation. One study found that out of 768 colleges and universities responding in a survey, 630 or 82% had courses in marriage and the family. The 630 institutions offered more than 1,000 courses in marriage and the family during the school year surveyed and at least 100,000 students were enrolled in the courses.

With the rather sharp decline in the average age at marriage since World War II there has been increasing belief that marriage education should be given at a younger age for the many who will never go to the university. Courses in preparation for marriage at the high-school level have been generally accepted. A survey in one state found that three-fourths of the schools responding to a questionnaire reported giving some time to marriage education in high school. The period of study might be from one week to a full semester course. Units of study have also been organized on interpersonal relationships within the family and are given by many schools at the junior-high and elementary levels. These courses do not focus upon preparation for marriage as at the college and high-school level, but they focus upon relationships so that the child will have some understanding of family life. Many churches have also organized short courses in preparation for marriage for their young people.

In 1938 the National Council on Family Relations was organ-

ized. This was the first attempt to bring together in one organization professional people interested in strengthening the family. Since 1938 the council's journal has published research findings on all aspects of marriage and the family. The members of the council are in the main from the fields of medicine, law, counseling, social work, religion, public-school teaching and college and university teaching and research.

Marriage Counseling.—In 1930 Paul Popenoe founded the American Institute of Family Relations in Los Angeles and in 1932 Emily Mudd established the Marriage Council of Philadelphia. These, and others established since, engage in premarital and marital counseling. Premarital counseling may be largely marriage education or it may deal with the special problems of the premarital period. Often couples who come for premarital counseling have doubts about whether they should marry and they come seeking guidance. Marriage counseling focuses upon the relationships between husbands and wives, in contrast to relationships between parents and children or relationships with the larger family. In addition to well-organized and well-staffed marriage counseling services, many individuals do marriage counseling. Some set themselves up as full-time counselors and charge a regular fee; others, such as ministers, are called upon to do counseling as a part of their over-all jobs. In 1942 the American Association of Marriage Counselors, Inc., was organized with the purpose of setting standards in the growing profession. Through setting minimal standards they hoped to give the general public some protection from unqualified counselors. The association has also worked with universities in helping them develop a training curriculum for people wishing to become counselors. The program of marriage education and counseling has been called a "folk" movement by some. People were interested in improving marriage and the family but they were not necessarily professionals. They came from many different walks of life and their ideas about improving family life ranged from pure superstition to the scientific. For this reason professional leaders place more and more emphasis upon the need for basic research into all aspects of family living. For years the area of marriage and the family has been the second largest field of research by sociologists in U.S. colleges and universities, and foundations have increasingly given support for family research.

Great Britain.—Outside the United States marriage counseling has developed in Great Britain more than in any other country. The pattern of development has been different in that marriage counseling has developed on a private fee basis in the United States whereas it has developed as a volunteer service in Great Britain. The first British Marriage Guidance centre was opened in 1943 in London. By 1947 there were almost 100 centres and in that year they united to form the National Marriage Guidance council. Since there were few trained counselors the plan was followed of selecting laymen who were qualified in terms of personality and marital experience, and then giving a preliminary course in counseling followed by in-service training and supervision. More than 1,000 counselors have been so trained and each year handle more than 10,000 clients who seek help with marital and premarital problems. The great majority of the counselors are in the age group from 35 to 50 and almost all have had the experience of successful marriage and parenthood. All counselors give their services without charge and they volunteer their services for from one to five counseling sessions per week. The cost of the marriage guidance centres is borne by contributions from clients, interested individuals and organizations and by grants from the government.

The British system of counseling has advantages in that those needing counseling have but one source to turn to when in trouble and this source is carefully regulated and supervised by qualified people. Couples having marital problems in the United States have almost no way of distinguishing between those who are qualified and those who are not. Further, the cost of marriage counseling is prohibitive for low-income families. Countries now starting marriage counseling services are more likely to copy the British system because it is inexpensive to operate and has the advantage of supplying a large staff of counselors in a short time. Further, the laymen given training and supervision seem to do as

well in counseling as do those who have had long years of professional training.

Europe.—On the continent of Europe marriage education in the schools and marriage counseling in the community have not developed as they have in the United States, although in Germany and in Italy marriage counseling is offered in many communities. Some research on the family has developed in universities, especially in the Scandinavian and in certain German universities. The principal approach to improving marriage and family life on the continent has been through the work of family organizations. In France family organizations are strong and have been instrumental in getting the government to establish family allowances, paid family vacations, improved facilities where families can spend their vacations, loans to build family apartment houses, loans for families who wish to buy apartments or homes, lower rail fares for families with children, special privileges for pregnant women and medical care for families. In several continental countries there is interest in the study of interpersonal relationships in the family.

Eastern Countries.—Marriage counseling as it is understood in the west has not developed in the east but a type of counseling has existed there for many years. Among some groups the match-maker or go-between who arranges a marriage also becomes a permanent sponsor of the marriage. If the marriage does not go well the couple may turn to the go-between with their problems. Since the go-between is often older, mature and respected he is also trusted with helping the married couple with their problems. In a way it is a reflection upon his ability as a go-between if a marriage fails. If the go-between cannot save the marriage through counseling then he may work with the couple in arranging the terms for divorce. In China the family organization called the Kiafong associations settled matters of family disputes. In Hong Kong the associations still handle marriage problems, as they do other problems in the community. The British government in Hong Kong has set up courts where people can take their family and marriage problems, but in most cases these courts do not act as counselors or as arbitrators in disputes. Rather the courts refer the marital problem back to the Kiafong associations which attempt to arbitrate the matter.

In Japan the government has established courts of conciliation to deal with many of the family problems growing out of the changing family pattern. The courts are not marriage counseling centres as they function in the western nations. Rather they are courts where people go with their problems and get a hearing before a board of three people. Two of the three people are called family court counselors and they are chosen from leading citizens who volunteer to give their services. The chairman of the group, the family court probation officer, is a permanent part of the court and usually has had special training in sociology or psychology and has attended the training and research institute for probation officers. The function of the court is not in most cases to help two people work through the problems in their relationship, but rather to arrange a settlement for family problems or affairs.

Many countries of the east are faced with a rapidly growing population and a scarcity of food supply. In India, for example, concern with marriage and the family centres almost entirely around encouraging married couples to limit their family to no more than four children. Some 2,500 family-planning clinics have been opened by the government and married couples are approached through discussion groups, the daily papers, the radio and posters, with the point of view that they should limit their families (see also BIRTH CONTROL).

MARRIAGE, LAW OF. Marriage as understood in the Christian world means the lifelong union of one man and one woman to the exclusion of all others, such unions being preceded by some form of ceremonial recognized by the law of the particular country in which it takes place.

Lord Stowell, one of the most eminent of the ecclesiastical judges in England, stated in the case of *Lindo v. Belisario* (1795) 1 Hag. Con. 216, 230:

It is held by some persons that marriage is a contract merely civil, by others that it is a sacred, religious and spiritual contract, and only so to be considered. . . . I conceive that neither of these opinions is perfectly accurate. According to juster notions of the nature of the marriage contract, it is not merely either a civil or religious contract. It is a contract according to the law of nature, antecedent to civil institutions, which may take place to all intents and purposes wherever two persons of different sexes engage, by mutual contracts, to live together. Our first parents lived together not in political society, but as individuals, without the regulation of any institutions of that kind. . . . A mere casual commerce, without the intention of cohabitation, and bringing up of children, would not constitute marriage under any supposition. But when two persons agree to have that commerce for the procreation and bringing up of children, and for such lasting cohabitation, that in a state of nature would be a marriage . . . in the sight of God. In most countries it is also clothed with religious rites, even in rude societies, as well as in those which are more distinguished for their religious and civil institutions.

Lord Stowell proceeded to quote from Henry Swinburne, 1560-1623, on *Espousals*, when he wrote: "It is a present and perfect consent which alone maketh matrimony, without either public solemnization or carnal copulation, for neither is the one, nor the other, the essence of matrimony, but consent only." This last enunciation was in effect endorsed in the 20th century by the house of lords in *Baxter v. Baxter* (1948) A.C. 274, where it was laid down that the procreation of children is not an essential requirement for a valid marriage.

When this was accepted as expressing the true law of marriage, complete divorce, save by the rare method of legislative act, did not exist (see *DIVORCE*). Although divorce has become common throughout the western world, it does not touch the previous validity of the marriages dissolved, this being dependent, with few exceptions, on mutual consent and the law of marriage formalities.

Roman Law.—The three primitive modes of marriage were *confarreatio*, *coemptio in manum* and *usus*, all of which had the effect of placing the woman in the "power" (*manus*) of her husband and on the same footing as the children. The first was a religious ceremony before 10 witnesses, in which an ox was sacrificed and a wheaten cake broken and divided between the spouses by the priest. *Coemptio* was a conveyance of the woman by *mancipatio* (handing over), and might be described as a fictitious sale. *Usus* was the acquisition of the wife by prescription, through her cohabiting with the husband for one year, without having been absent from his house three continuous nights. But a true marriage might be concluded without adopting any of these modes, which all fell into desuetude and with them the subjection of the wife to the *manus*. Marriage without *manus* was contracted by consent, without writing or formality of any kind. The consent of the *paterfamilias* to the marriage of the children under his power was essential.

In Roman law no slave could contract marriage whether with another slave or a free person. The union of male and female slaves (*contubernium*) was recognized for various purposes; a free woman entering into a union with a slave incurred under the *S.C. Claudianum* the forfeiture of her own liberty; but the bondswoman might be the concubine of a freeman. (In the United States, where slavery was said to be regulated by the principle of the civil law, the marriage of slaves was so far recognized that on emancipation complete matrimony took effect and the children became legitimate without any new ceremony.)

In Roman law no legal marriage could be contracted unless there was *connubium* between the parties. Originally there was no *connubium* between plebs and patricians, and in later times between the *Latini* and *peregrini*, unless it had been expressly conferred. The *Lex Julia* and the *Lex Papia Poppaea* introduced restrictions depending on the condition of the parties which later legislation extended and perpetuated. Senators under that law were forbidden to marry freedwomen or women of inferior rank, and the husband of a freedwoman on becoming a senator was set free from his marriage. (See also *ROMAN LAW*.)

Canon Law.—The canon law of the Roman Catholic Church was the only law governing matrimonial relations in western Europe until the Reformation and has still exclusive authority in some Roman Catholic countries.

The church adheres to the principle of the indissolubility of marriage except by the death of one of the spouses, and there is no divorce *a vinculo* (from the bonds of marriage) as is administered in Anglo-American law. The principle of indissolubility purports to have been proclaimed by Christ without qualification according to Mark x, 11, 12 and with the qualifying clause "saving for the cause of fornication" according to Matt. v, 32. Scholars still question whether the word "porneia," translated as "fornication," really meant adultery or premarital conduct, but it is now the majority opinion that it meant unchastity by the wife generally, with special reference to postmarital unfaithfulness persisted in to a point where it became a virtual renunciation of the marriage. This exalted view of marriage envisaged that man and wife were made "one flesh" by the act of God; "What therefore God hath joined together, let not man put asunder" (Mark x, 9). It is to St. Paul that the idea of marriage as a sacrament is to be traced, in the mystic comparison of the relations of husband and wife to those of Christ and his church (Eph. v, 23-32). Marriage, from being no more than a terminable civil contract, became a sacrament, a mystic union of souls and bodies never to be divided; valid, indeed, but not spiritually complete, without the public blessing of the church (Tertullian, *Ad uxorem*, bk. ii, ch. 9).

In canon law mutual consent of the parties was regarded as essential to marriage: *matrimonium non facit coitus sed voluntas*. In A.D. 866 Pope Nicholas I proclaimed: "If the consent be lacking in a marriage, all other celebrations, even should the union be consummated, are rendered void." The practice of marriage between a man and a woman, without witness or ceremony (*per verba de presenti*), led to so many evils of clandestinity that the Council of Trent's decree *Tametsi* in 1563 enacted that marriages should be celebrated in the presence of a priest and not less than two witnesses.

In the absence of any impediment a marriage is, according to canon law, completed between baptized persons by the facts of consent and consummation; the principle is still maintained that the parties to the marriage, not the priest, are the "ministers of the sacrament." From early days the church, while recognizing the validity of private contracts, enjoined the addition of a public religious ceremony (1 Tim. iv, 5). Tertullian (*De pudicitia*, ch. iv) says that clandestine marriages, not professed in the church, were reckoned among Christians as all but fornication. Charlemagne, in a capitulary of A.D. 802, forbade the celebration of a marriage until "the bishops, priests and elders of the people" had made diligent inquiry into the question of the consanguinity of the parties. This was the origin of the publication of banns which, long customary in France, was made obligatory on the whole church by Pope Innocent III. Canon law held a marriage to be null and void for a variety of reasons; e.g., if the parties were within certain prohibited degrees of consanguinity of affinity. The grounds of nullity under the *Corpus Juris Canonici* published in the 16th century numbered 18, some of which are obsolete. Those still administered by the Roman Catholic Church include consanguinity and affinity, very much reduced from their former wide scope, disparity of religion, and mental reservations contrary to the real purposes of marriage, but exclude wilful refusal to consummate a marriage.

For concubinage, which restrictions on marriage tend to develop, see *CONCUBINAGE*. The left-handed or "morganatic" mar-

riages of the German royal family are the nearest approach ever made by concubinage to true marriage, the children being legitimate, but neither they nor the wife acquiring any right or rank or fortune of the husband (see MORGANATIC MARRIAGE).

Canon law also restricts marriage in other directions: the order of clergy were forbidden to marry. Disparity of faith was recognized by the early church as a bar to matrimony; e.g., between Christians and pagans and between orthodox and heretics. In modern times when Roman Catholics marry non-Catholics, canon law requires that the non-Catholic spouse agree that any children they may have will be baptized and brought up as Catholics. (W. LA.)

Orthodox Church.—The canon law of the Orthodox Church is made up on one hand by the rules of the councils and early fathers found in the official collections of canon law and on the other by the religious legislation of the Byzantine emperors. The decrees of the standing synods (*endémousai*) of the Byzantine epoch have also to be taken into consideration. Since that time the legitimacy of jurisprudence and local legislation has been judged by its conformity with the norms fixed in the earlier period.

Christian marriage is a sacrament and the blessing of a priest is considered one of the necessary conditions of validity (novel 89 of the emperor Leo VI). The betrothal is invariable and is accompanied by a religious ceremony which creates the same obligations in canon law as the marriage itself. The prohibition against consanguinity and affinity extends in principle to the seventh degree; and a dispensation cannot be given beyond the limit fixed by canon 54 of the Council of Trullo (fifth degree). Affinity is also created between godparents and godchildren (canon 53 of Trullo). The Orthodox church is tolerant of three successive marriages (canon 50 of St. Basil) but under no circumstances will permit a fourth. Parish priests are permitted wives but bishops are never married (council of Trullo, canon 12). In Greece there is no civil marriage for persons of the Orthodox faith.

(P. L'H.)

BRITAIN AND THE COMMONWEALTH

Requisites for a Valid Marriage in England and Wales.—

By English law the requisites for a valid marriage are that: (1) each party shall have attained the age of 16 years (Age of Marriage act, 1929); (2) each party shall be mentally capable; (3) the parties shall be outside the prohibited degrees of affinity and consanguinity; (4) each shall be free to marry; i.e., not bound by a subsisting marriage; (5) each shall give his free and mutual consent to marry, with a proper understanding of the contract; (6) each shall be sexually competent, except where consent is given notwithstanding impotence, known to both parties; (7) the marriage ceremony conforms with the statutory formalities. Monogamy is the invariable rule.

Age of Marriage.—Before the Age of Marriage act, 1929 (which covers Scotland), the common-law rule in general was that the ages for a valid marriage were 14 for a male and 12 for a female. This rule was not abrogated in the Republic of Ireland. In former days marriages were celebrated between children over seven years of age, especially in royal families, but any such marriage was voidable on the male reaching the age of 14 and the female of 12 years. Henry VIII, when under 14, was married to Catherine of Aragon, widow of his deceased brother Arthur. On reaching the age of 15 he avoided, or repudiated, the marriage, but in 1509 he married her again. How the marriage was annulled years later is a well-known matter of history. In England the age of 16 is binding; there can be no departure from the 1929 act (now merged in the Marriage act, 1949) with regard to anyone under that age, although the courts will recognize marriages of young persons under that age in countries where they are legally valid, if such persons are domiciled in those countries. A marriage between a man domiciled in England at the time of the ceremony with a foreign girl under 16 years of age was held to be invalid, though by the law of her country such a marriage was permissible (*Pugh v. Pugh* [1951] P. 482).

Mental Capacity.—Mental capacity to marry has been judicially interpreted as possessing an understanding of the elemen-

tary duties and obligations of marriage. If the man or the woman is merely a dullard, that fact alone is not a bar to marriage, even if either enters into the bond ignorant of what, in regard to sex is commonly termed "the facts of life." If a person has been temporarily treated as a mental patient he may marry during a lucid period.

If a person is proved to have been of unsound mind at the time of the marriage the other spouse may obtain an annulment. In a nullity suit in England Lord Merrivale, president of the divorce division, said (*Forster v. Forster* [1923]): "The question is whether the respondent was mentally incapable of understanding the nature of the marriage contract, and the duties and responsibilities which it creates. The mind of one of the parties may be capable of understanding the language used, but yet may be affected by such delusions, or other symptoms of insanity, as may satisfy the tribunal that there was not a real appreciation of the engagements entered into." In this statement of principle the judge was repeating a dictum of a former eminent president, Sir J. Hannen (*Durham v. Durham* [1885] 10 P.D. 20).

Under the Matrimonial Causes act, 1950, a marriage may be annulled on the ground that a party to the marriage was at the time of the ceremony of unsound mind or a mental defective or subject to recurrent fits of insanity or epilepsy. Medical opinion is divided on the last-named malady, but in rare cases decrees have been pronounced on that ground. A petition on these grounds must be presented within a year, and must be subject to the condition that the petitioner was ignorant at the time of the ceremony of the respondent's malady and that there has been no marital intercourse after its discovery. (See also ANNULMENT.)

Prohibited Degrees of Marriage.—These were at first those set out in the *Book of Common Prayer*, but by a series of acts beginning with the Deceased Wife's Sister Marriage act, 1907, and ending with the Marriage (Enabling) act, 1960, the rules of affinity on barring marriage have been modified, so that people may, in specified degrees, marry relatives not of the same blood. The exceptions are set out below:

- A man may marry his
 - deceased wife's sister;
 - deceased brother's widow;
 - deceased wife's brother's or sister's daughter (i.e., niece by marriage);
 - father's or mother's deceased brother's widow;
 - deceased wife's father's or mother's sister;
 - brother's or sister's deceased son's widow.
- A woman may marry her
 - deceased husband's brother;
 - deceased sister's widower;
 - deceased husband's brother's or sister's son;
 - father's or mother's deceased sister's widower;
 - deceased husband's father's or mother's brother;
 - brother's or sister's deceased daughter's widower.

In a case in the English divorce court, *Cheni v. Cheni* (1962), a marriage between a Sephardic Jew and his blood niece in Egypt, where such marriages are valid according to Jewish ecclesiastical law, was recognized as valid.

The Marriage (Enabling) act, 1960, removed the former bar against a man's marrying the sister of his divorced wife during the latter's lifetime, or of a woman's marrying the brother of her divorced husband, as well as the bar from the more remote relationships which had been excepted by statute. (See also CONSANGUINITY.)

Although marriages within the prohibited degrees have been described as incestuous in civil law, incest is only a criminal offense in England if there is sexual intercourse between a man and his mother, daughter, sister or granddaughter.

Bigamy.—There can be no valid marriage between two persons one of whom has a living wife or husband. Polygamous marriages are not recognized by the English courts unless the parties are domiciled at the time of the ceremony in countries where polygamy is authorized by law, as for example in the case of Muslims according to the Islamic law. Even so it has been held in judicial decisions that a man who has lawfully contracted a polygamous marriage abroad cannot lawfully marry another woman according to English law wherever it prevails. Notwithstanding, polygamous marriages, valid according to the law of the domicile, have fre-

quently been recognized as binding with regard to questions of property, succession and legitimacy. (See BIGAMY.)

Mutual Consent.—On the subject of mutual consent there must be no duress or threats leading up to the ceremony; and if one of the parties is incapable through drink or drugs or mental incapacity, or if there was a misunderstanding as to the nature of the ceremony, e.g., supposing it to be a mere betrothal, it may be pronounced invalid by the court.

Impotence.—Impotence by one or other of the spouses has always been regarded as invalidating a marriage if the aggrieved party chooses to petition for nullity, and a spouse may also petition for nullity on the ground of his own impotence. But where it is proved that the petitioning party consented to marry though aware of the other's impotence, his or her remedy may be barred.

Formalities.—In England formalities of marriage are set out in the consolidating Marriage act, 1949. Marriage in the Church of England may be solemnized after the previous publication of banns on three successive Sundays following seven days' notice to the clergyman; or by the issue of (1) a special licence by the competent ecclesiastical authority permitting the ceremony to take place in any church or chapel or other convenient place at any time; or (2) a common licence from the ecclesiastical authority for a marriage in a church or chapel in the residential district or the usual place of worship of one of the spouses; or (3) a superintendent-registrar's certificate, which necessitates certain declarations by the parties.

Before a licence can be granted an oath must be taken as to the fact of residence and, when either party is under 21, that the necessary consent has been obtained from the father or lawful guardian. The absence of such consent does not, however, render a marriage void once solemnized. But if persons wilfully intermarry (unless by special licence) in a place other than a church or public chapel, or without due publication of banns or proper licences, or before a person not in holy orders, the marriage is null and void for all purposes. Marriage must be celebrated within three months after banns or licence, and between the hours of 8 A.M. and 6 P.M. In the Church of England the clergyman officiates, there must be two witnesses and the spouses must sign the register. The moment of marriage in church is when the hands of the spouses are joined together and the clergyman pronounces them to be man and wife. The production of a wedding ring is not obligatory.

The Anglican canon prohibiting the marriage in church of a person whose previous marriage has been judicially dissolved has no statutory authority, but by the Marriage act, 1949, if in those circumstances a clergyman declines to officiate he must permit any other clergyman within the diocese to perform the ceremony if the latter is willing. A discretion is left to the bishop to override the prohibition, but it is seldom exercised.

According to the earliest Roman customs a woman took her husband's name on marriage. The Roman Catholic Church continued this practice. Subsequently it was judicially laid down that a woman after divorce or nullity may reassume her maiden name, and nowadays any person, married or otherwise, may assume another name by deed poll.

Civil Marriage.—Civil ceremonies at the office of registrar of marriages, first sanctioned by the Marriage act, 1836, may be authorized by the issue of a superintendent-registrar's licence or certificate, after due notice and statement of specific particulars, and in the presence of the registrar. In the case of marriages according to Roman Catholic, Jewish or Quaker rites the presence of a registrar is required, subject to certain statutory exceptions. The Marriage act, 1949, was amended in 1954 with respect to the residential requirements and in 1958 regarding the registration of buildings and persons before whom marriage might be celebrated. The Royal Commission on Divorce reported in 1912: "Many witnesses . . . point to the power to contract marriage at an age too early; to the need for further and more stringent provisions as to obtaining the consent of parents or guardians to the marriage of minors [later the Guardianship of Infants act, 1925, in some measure dealt with this problem]; to the need for more adequate public notice of intended marriages,

and more publicity and formality in marriages before registrars; to the want of any provisions for insuring the fitness of persons, mentally and physically, to marry, and that they have adequate means of livelihood and to other matters which render a marriage unsuitable." The minority report contained the following passage: "(In church) the promise publicly made by each of the spouses to the other is: 'I take thee to be my wedded wife, to have and to hold from this day forward, for better for worse, for richer for poorer, in sickness and in health, to love and to cherish, till death us do part.' . . . In a marriage at a register office, the corresponding undertaking is put more briefly, thus: 'I do take thee to be my wife.' It may, we think, be safely assumed that the latter form is not intended to denote any less far-reaching acknowledgement of reciprocal obligation than the former expressive terms."

Irregularities.—Irregularities in prescribed formalities which do or do not invalidate ceremonies of marriage may be summarized as follows:

A marriage is valid despite irregularities when: (1) the licence was granted the day after ceremony; (2) the licence was obtained under assumed names or by fraud of one spouse unknown to another spouse; (3) there was fraud in the inducement of marriage; (4) certain false or mistaken particulars were given for publication of banns or for a register office marriage; (5) the marriage in church was before only one witness. A marriage is invalid when: (1) in a building not authorized for marriage; (2) the banns were published unduly with the knowledge and consent of both partners.

Royal Marriages.—The sovereign king or queen is debarred from marrying a Roman Catholic under the Bill of Rights, 1688, and the Act of Settlement, 1700, but otherwise may in law marry whom he or she likes. The case of King Edward VIII (duke of Windsor), who abdicated his throne in 1936, pointed to the strong influence of ministerial and ecclesiastical opinion hostile to his choice. The Royal Marriages act, 1772, laid down that no descendant of George II who is under 25 shall be able to marry without the consent of the sovereign, under the Great Seal. If such a descendant is over 25, and his intended marriage is disapproved of by the sovereign, then he should give 12 months' notice in writing of it and after that time, unless both houses of parliament disapprove, the marriage can be validly solemnized.

Foreign Marriages.—The form and ceremonies of entering into a contract of marriage are regulated by the place where the marriage was celebrated, but the capacity for marriage depends on the law of the country in which the parties are domiciled at the time of the marriage. Under the Foreign Marriage act, 1892, all marriages between parties of whom at least one is a British subject in a foreign country before a competent marriage officer are valid in English law, though such marriages are not solemnized according to the *lex loci celebrationis* (according to local usage). The same applies to any part of the British forces stationed abroad or occupying foreign territory, as in the case of the army of occupation in Germany after World War II. At such a marriage any chaplain or authorized marriage officer may conduct the ceremony.

Common-Law Marriages.—What are termed common-law marriages are allowed in rare circumstances, as for instance a marriage in emergency aboard a British merchant ship, whether a clergyman or ship's officer officiates. The intention of the parties to marry must be clearly expressed wherever such a marriage of necessity is contemplated. A ceremony between British subjects in China before a minister not authorized by the Foreign Marriage act to officiate was pronounced a valid common-law marriage (*Wolfenden v. Wolfenden* [1946] P. 61). When a Polish officer in the army of occupation in Italy was married according to Roman Catholic rites in that country, both Italian and Polish laws then requiring civil marriages, the court of appeal held that it was a valid common-law marriage (*Taczanoswska v. Taczanoswska* [1957] P. 301).

Presumption of Marriage.—The doctrine of marriage by habit and repute applies where a man and a woman are proved to have lived together as man and wife for years; the law presumes that there has been a valid marriage in the absence of clear proof to the contrary. The question only arises after the death of one

of the parties, and it may relate either to succession or the legitimacy of a child.

Jurisdiction in Nullity.—If, when the nullity suit is commenced, the petitioner or both parties are domiciled in England, or both parties are resident in England, or the wife is enabled to sue on the ground of three years' ordinary residence in England under the Matrimonial Causes act, 1950, s. 18, then the court can entertain the suit on any of the established grounds. Until 1962 jurisdiction also arose from the fact of the marriage having been celebrated in England, but in the house of lords case of *Ross-Smith v. Ross-Smith* (1962) 2 W.L.R. 388, it was held that jurisdiction on that basis was permissible only if it was a case of a marriage void *ab initio* (from the beginning) as distinguished from voidable.

Marriages void *ab initio* are those in which one or both parties are barred by (1) nonage; (2) bigamy; (3) affinity or consanguinity; (4) informality in ceremony; (5) insanity at the time of marriage. It is frequently necessary to obtain a decree or declaration of the court to put on record the fact that such a marriage was a nullity. In the category of voidable marriages at the wish of one of the parties are also (1) impotence; and the following grounds of nullity first introduced in the Matrimonial Causes act, 1937, and now contained in the Matrimonial Causes act, 1950, viz., (2) wilful refusal to consummate the marriage; (3) the degree of unsoundness of mind mentioned previously in this article; (4) venereal disease in a communicable form at the time of marriage; and (5) pregnancy of the wife at the time of the marriage by another than the husband. As regards the last four grounds there are time limitations and other conditions attached.

Legal Effects of Marriage.—Until the Law Reform (Married Women and Tortfeasors) act, 1935, a husband could in certain circumstances be held liable in tort for his wife's wrongful acts, but since that act a woman is in the position of a single woman unless it can be shown that she was in fact an employee or agent. Similar considerations apply to the law of contract.

A husband is not liable for obligations contracted by his wife unless it can be shown that she acted as an agent of necessity. At common law a man is bound to support his wife, and under a section of the Matrimonial Causes act, 1950, she may, without embarking on a suit for divorce or any other matrimonial cause, claim maintenance in the high court if he has wilfully refused to provide her with reasonable maintenance. Moreover by an act which came into operation on Aug. 1, 1962, both parties to a marriage have the same right of action in tort as strangers, though the court has a discretion to order a stay of proceedings if no substantial benefit would be gained or if the claim could more conveniently be brought under s. 17 of the Married Woman's Property act, 1882.

The English law, whereby the father was normally entitled to dictate the faith of his children, has been modified in cases of dispute between the parents on this point by judicial practice, so that each case is dealt with on its merits. The practice on this point varied in Europe—the question being ignored in French law, Germany following in some respects the same rule as England, in others giving effect to antenuptial stipulations. In Ireland mixed marriages (*i.e.*, between Roman Catholic and Protestant) were by 19 Geo. II, c. 13, null and void if celebrated by a Roman Catholic priest. This act was repealed by 33 and 34 Vic., c. 110, which permitted mixed marriages to be validly celebrated by an Episcopalian or Roman Catholic clergyman, subject to conditions set forth in s. 38.

On marriage any will made by either of the parties lapses, unless it is specifically made in contemplation of the marriage, although of course after marriage a fresh will may be made. (*See HUSBAND AND WIFE, LAWS CONCERNING.* For Scotland *see* SCOTS LAW.)

British Commonwealth.—In Canada, Australia and New Zealand the English law of marriage prevails, subject to minor variations in formalities, as also the law of nullity. The same applies to Northern Ireland, as part of the United Kingdom, and no change has been made in Eire since it became the independent republic of Ireland outside the commonwealth, most of the marriages

there being celebrated according to Roman Catholic rites. The British Colonial Marriages act, 1865, provided that all laws made by legislatures in British possessions abroad for the proof of valid marriages should have the same form throughout, subject to legal competence of the parties to marry. The Indian Christian Marriage act, 1872, laid down the formalities. Within the remaining British crown colonies racial and religious customs with regard to non-Christian marriages have always been taken into account.

UNITED STATES

Marriage law in the United States is subject to the exclusive province of each state. The legal conception of marriage is the same as that described under English law. The fundamental principle is simply that a man and a woman, each possessed of the requisite capacity, may become married by mutual consent. Although marriage has been defined variously in different states as a contract, a status, or an institution, the well-known jurist J. P. Bishop, in his *New Commentaries on Marriage, Divorce and Separation* (1891), emphasized that marriage had scarcely any of the ordinary elements of civil contract but pertained to status. He defined marriage as the civil status of one man and one woman legally united for life, with the rights and duties which, for the establishment of families and the multiplication and education of the species, were assigned by the law to matrimony. Nevertheless about a third of the states have passed statutes defining marriage as a civil contract, including Nevada, which is conspicuous for both its marriage and divorce laws.

Requisites for a Valid Marriage.—In general the legal capacity of a person to marry is the same all over the Christian world and subject to impediments such as consanguinity and affinity. The parties must have attained a certain age to be married. At common law, marriages below the age of 12 for girls and 14 for boys were void. As J. P. Bishop points out (vol. I, p. 244) these ages, based on puberty, were set up in the common law and, having originated in the warm climate of Italy, were not entirely suited to northern latitudes. These ages have been raised in almost every state. Typically a state forbids the marriage of girls below 15 or 16 and of boys below 18. Whether the marriage of a person below the statutory age is absolutely of no effect (void) or is effective unless nullified (voidable) depends upon the special facts of each case and upon the particular law of each state. In Alabama (1886) the minimum ages were fixed at 17 for a male and 14 for a female; in North Carolina 16 years for each. Usually, males under 21 and females under 18 must obtain the consent of their parents before a licence can be issued.

Impediments to Marriage.—Persons may not intermarry if a close relationship by blood (consanguinity) or by marriage (affinity) exists between them. Prohibited degrees are fixed by statutes in the various states and in general are the same as in England in respect to blood relationship, but about half the states have forbidden marriages on the ground of affinity. In general, a marriage is incestuous if one attempts to marry an ancestor, a descendant, an aunt (uncle), a sister (brother) of the whole or the half blood or any of their respective spouses. In the 1960s, over 30 states had prohibited marriages between first cousins, while several forbade marriage to a grandniece (grandnephew) and to a first cousin once removed. In Texas a man may not marry his son's divorced wife but may marry his son's widow. In Iowa it was held that a man could marry the daughter by a former marriage of his divorced wife. In none of the states is marriage forbidden between a man and his deceased or divorced wife's sister or a woman with her deceased or divorced husband's brother.

Miscegenation statutes prohibiting and declaring invalid marriages between persons of different colour are on the statute books of about 30 states, but their compatibility with the 14th amendment to the U.S. constitution is doubtful. In California, the state statute was declared invalid in 1948 under both the federal and the state constitutions. In a case in which a Negro living in Virginia proceeded from there with a white woman to the District of Columbia and went through a ceremony of marriage there, afterward returning to Virginia, the marriage was held to be void. But

on the other hand when there was a marriage in Rhode Island between a Negro and a white person domiciled in Massachusetts, which state prohibited such a marriage, the marriage was held to be valid because Rhode Island allowed such marriages.

Provisions forbidding the marriage of persons afflicted with certain diseases such as imbecility, epilepsy and even tuberculosis exist in almost all states, but without the process of medical inspection and certificates they are of little use. By 1959, 44 states had forbidden the marriage of a person suffering from communicable venereal disease, but once such a marriage has been celebrated despite the existence of such diseases, it is valid.

Marriage Formalities.—For the initiation of a marriage a ceremony of some kind is generally required, so that, in order to be married, the couples have to present themselves to a magistrate or some other secular officer or to the minister or priest of a religious community. None of these, however, may perform a marriage ceremony unless the parties have a licence issued by a secular officer, usually the county clerk, who is supposed to withhold the licence if the intended marriage would be illicit. More than half the states require a notice by the parties of short periods varying from one to five days. In order to secure proper records the minister or justice before whom the ceremony is performed has to notify the recording officer of the state, usually the director of the state department of public health. Nevertheless the ease and comparative cheapness of the marriage solemnization may be illustrated by the extreme case of Las Vegas (Nevada), with a population of about 65,000, where in 1961, for example, no less than 30,000 marriages took place, mostly between migratory persons.

Common-Law Marriages.—Informal, or "common law" marriages as they came to be termed, by which a couple could marry by mutual consent without any ceremony or even witnesses, were prohibited to England in 1753 by Lord Hardwicke's act, a religious ceremonial being substituted. This act did not apply to Scotland or the English colonies beyond the seas. In the American colonies in particular, common-law marriage thus remained possible, and that situation continued until most states, by express statutory enactment, required a public ceremony as an essential requirement for the validity of the marriage. In the 1960s common-law marriage was still possible in about one-third of the states.

Validity of Marriage.—A "common law" marriage is valid "notwithstanding the existence of any statute on the subject, unless the statute contains express words of nullity." Thus if a statute forbids solemnization without a licence, in the absence of a clause of nullity the marriage will be good. "In any view," said Chief Justice Marshall in *Stevenson v. Gray*, 17 B. Mon. 193, "these directory provisions, though prohibitory and even penal with respect to the officers (i.e., justice or ministers), have not been regarded as affecting the validity of a marriage otherwise legal." These words were uttered in the 19th century, and since that time marriage without the usual formalities has become a rarity and has earned judicial disfavour. Nevertheless it had been held in Pennsylvania where a statute required 12 witnesses to a marriage that marriages not so celebrated were valid; in Massachusetts, though officiating persons were forbidden under a heavy penalty to perform marriage ceremonies in the case of minors, except with the consent of their parents, the absence of such consent did not void a marriage once it was celebrated.

In general the principle is maintained in the United States that the validity of a marriage is governed by the law of the place in which it is solemnized. If the formalities of a foreign marriage differ from those required by the law of the domicile but are duly observed, the marriage is valid everywhere, subject of course to the competence of the parties to enter into marriage.

Marriage by proxy, although a comparatively rare procedure, is not forbidden in any state except Louisiana, and there only in respect of such marriages contracted within that state; and it is expressly allowed in Kansas by statute. Such marriages were not uncommon during World War II between couples of which the man had gone abroad on war service. There were cases of valid proxy marriages through the medium of telegram and radio. Though rarely exercised now, owing to the facilities for rapid

transport, it was a common practice in medieval days among royal or princely families. A marriage by proxy in the law of the District of Columbia was held to be good in *New York (Fernandes v. Fernandes)*, 274 App. Div. 777 [1949]. Among the recorded cases of proxy marriage by telegram during World War II was one when a girl in Washington, D.C., married a soldier in Australia. It took 17 days to complete. The man telegraphed to the girl: "Will you marry me by cable? Today I (full name followed) take you (her full name followed) to be my lawfully wedded wife." She telegraphed back in similar terms. A minister deposed to the wife's acceptance.

North American Indians.—As regards Indians who continue to live in tribal conditions in the United States, the tribal custom of marriage is generally recognized, and the courts have even held to be valid polygamous marriages performed in Indian reservations. An Indian marriage was held valid in Nebraska, though both parties had been married before and divorced according to tribal law, and the ordinary law against bigamy was not allowed to invalidate some polygamous Indian marriages in Oklahoma. Before the abolition of slavery in the United States the degree of recognition of unions between slaves as lawful marriages varied from state to state. Formerly there was no such recognition in Alabama, but after the emancipation such marriages were held valid if cohabitation between the parties continued, and it was the same in Louisiana and Oklahoma.

Disposition of Property.—In the United States the old English common-law principle that a man must maintain his wife has always prevailed, coupled with the equitable principle which in the course of over a century has given the wife more or less equal rights to property. Estates by the entirety, generally arising when real property was conveyed to husband and wife jointly and upon the death of one the property accrued to the other, have been limited in most states by legislation or case law. In about half the states, no such right attaches to the marriage status, though it is still applicable in the District of Columbia. In New York and New Jersey "estate by entireties" partakes more of the character of a tenancy in common. Community of property (*see COMMUNITY PROPERTY*), a system borrowed from Latin Europe, prevails in 8 states, whereby husband and wife are each entitled to half the property.

In most states the common law as to the effect of marriage is applied by statute, i.e., wills made before the marriage lapse, but in some statutes the will revives if the wife survives her husband. In some states, where wives were held incapable of making a will, they might by republishing antenuptial wills revive them. In several states an antenuptial will made in contemplation of the marriage, as in English law, does not lapse.

Actions for Enticement.—Apart from proceedings for divorce and separation (*see DIVORCE*), there still exists in a number of states the right of action by a married person for alienation of affections. This arises from the traditional action in England, abolished in 1857, for criminal conversation, and is equivalent to the very rare English action of enticement. If a husband in these states is deprived of the consortium of his wife by the active and deliberate conduct of a third person he may sue for damages. Wives have the same right of action as their husbands in those states where this action is possible.

Annulment of Marriage.—In the United States the law relating to validity of marriage, derived from canon law, is much the same as in England, except that statutes in certain states allow some grounds of nullity not exercised in England. The minimum age required for marriage differs in various states, as does the requirement of parental consent to the marriage of minors. Marriages under the prescribed ages may be ratified by subsequent cohabitation, and if ratified no action for annulment may lie on the ground of nonage. The purpose of most of the statutes requiring consent of parents is not to void such marriages but to impose penalties on ministers and magistrates who negligently officiate at such ceremonies. In about half the states a marriage may be annulled for nonage only on the application of the parties or their parents, and there is judicial power to recognize certain marriages which would otherwise be voidable for infancy. A marriage

may be annulled if the parties are within the forbidden degrees of affinity and consanguinity. Although at common law the children of a void marriage are illegitimate, in over 30 states such issue is legitimate by statute.

Regarding jurisdiction in annulment, there are no such nice distinctions in the United States as there are in England. The juridical considerations are the same as in divorce except that the place of the marriage would confer the power of annulment in that state, whatever the ground. Yet in some states the grounds for annulment are wider than in English law; e.g., concealment of conviction for a serious crime, or of affliction with tuberculosis, or gross fraud and misrepresentation as to a man's property or character.

(W. LA.)

EUROPE

Italy, Spain and Portugal.—In Italy, Spain and Portugal the Roman Catholic Church preserves its ancient powers and has exclusive jurisdiction over matrimonial affairs.

Greece.—For Greek marriage law see *Canon Law: Orthodox Church*, above.

France.—In France articles 144–226 of the civil code, as amended by several acts, prescribe the qualifications and conditions of marriage. The man must be 18 and the woman 15 years of age. A son or daughter under 21 cannot marry without consent of the father and mother, or of one of them (act of July 17, 1927) if they disagree or have been divorced, or of the survivor if one is dead. If both parents are dead, the grandfather and grandmother, or one of them, take their place. If the grandparents are also dead, the consent of the family council, deciding by a majority, must be given. Between the ages of 21 and 30 the parties do not have to obtain the consent of their parents but must make a "respectful and formal act" before a notary when consent is failing (act of Feb. 2, 1933). Adoptive children under 21 cannot marry without consent of their adoptive parents (act of July 29, 1939). (See also FRENCH LAW: *The Civil Code* [1804].)

Marriage is prohibited between all ascendants and descendants in the direct line, and between persons related by marriage in the same line, between brother and sister, between uncle and niece, aunt and nephew, between adopter's and adoptive children and between adoptive children. In the collateral line, the act of July 1, 1914, suppressed the prohibition between brother-in-law and sister-in-law unless the marriage producing the affinity has been annulled by divorce.

Before the solemnization of marriage, a publication notice must appear on the door of the town hall for a period of ten days. The notice contains the names, Christian names, occupations, domiciles or residences of the parties and the place where marriage is to be celebrated. Since the act of Aug. 9, 1919, the notice has contained nothing about the parents. According to an act of Nov. 2, 1945, the parties must give a medical certificate to the civil officer. If the marriage cannot be celebrated during the year, a fresh notice must be put up. The marriage is celebrated in the parish to which one of the parties belongs by the civil officer or registrar. He reads to the parties the various necessary documents, with the chapter of the code relating to husband and wife, receiving from each a declaration that they take each other for husband and wife and drawing up the act of marriage. All this must be done in the presence of two witnesses. In the case of Roman Catholics a religious ceremony will take place after the civil ceremony. Marriages contracted abroad between French subjects or between French subjects and foreigners are valid in France if celebrated according to the forms of French law, before French competent consuls, or according to the forms of the foreign law, provided the French conditions as to consent of parents have been observed.

(J. M.-M. L.; X.)

Germany.—The law of marriage and divorce in 1946 adopted the marriage law of 1938, with the exception of typical National Socialist provisions. The law recognizes only marriage concluded before the registrar; i.e., civil marriage. Church marriage may only take place afterward. Since 1947 foreigners may be married in Germany before diplomatic or consular representatives according to their own laws.

A man may not contract a marriage before he has completed his 21st year; a woman before she has completed her 16th. With special permission, both may marry earlier, but the man only if he has completed his 18th year and is no longer subject to parental authority or under the care of a guardian.

After public notice is given, the marriage is concluded when the contracting parties declare in the presence of each other before the registrar that they wish to marry each other. Two witnesses should be present and the registrar should enter the marriage in the register.

Marriages are forbidden and, when celebrated, are void, between ascendants or descendants or full or half brothers and sisters. Also forbidden and void (unless special permission is given before or after the marriage) are marriages between relations by marriage in a direct line; and between a person divorced for adultery and the person with whom the adultery was committed, subject to exemptions where appropriate. Marriages should not be contracted (although such marriages are not therefore void) by persons between whom there is an adoption relationship; by a woman whose former marriage has ended less than ten months previously, subject to exemption; and by foreigners without a certificate from their own country stating that there is no impediment to the marriage.

Marriages are also void where, at the time of the marriage, one of the parties was legally incapable, or where the essential form of the ceremony was infringed. In these cases marriages are, however, valid if the parties have lived together for a certain time. After 1945 formerly invalid "free" marriages between persons persecuted on racial or political grounds, displaced persons and refugees were under certain conditions recognized by law. A marriage is void if contracted solely or primarily for the purpose of enabling the wife to bear the name of the husband without the establishment of conjugal relations, but the marriage will be validated if the couple have lived together after the ceremony for five years, and in certain circumstances for at least three years.

Void marriages count as being so from the beginning; but this effect only comes into operation once a court decision has been given. Children of such marriages are legitimate if they would have been so had the marriage been valid. The disposition of the property of the partners is regulated according to the divorce rules if at least one partner is ignorant of the nullity.

A marriage can only be declared null by the court for grounds existing at the time when the marriage took place: lack of consent by legal representative; an error over the marriage ceremony, the person or the person's essential characteristics; wilful deceit; and threats. The marriage becomes invalid only at the time when the court annuls it, though before 1938 it was void from the beginning. (See GERMAN LAW: *Civil Law*.)

(G. K.; W. LA.)
U.S.S.R.—Soviet law recognizes only civil marriage. Unregistered marriages were acknowledged in several republics of the Union until July 8, 1944, when a decree of the presidium of the supreme soviet enacted that only a registered marriage could confer marital status and rights. Complete equality of spouses in every respect is guaranteed by the constitution (sec. 122). Monogamy is strictly enforced, bigamy being a criminal offense.

Marriage in the Soviet Union must be completely voluntary and both parties must be over 18 years of age. Local councils may permit marriage where one of the parties is a year or at most two years younger, but such permission is granted only in exceptional circumstances. In certain of the Asian republics women may marry at the age of 16. By a decree of Feb. 15, 1947, marriage between Soviet citizens and foreigners is forbidden (see SOVIET LAW).

AFRICA, ASIA AND THE FAR EAST

Middle East and North Africa.—Islamic law applies in all matters of personal status of Muslims, and in some Arab countries such as Saudi Arabia and Yemen, Muslim law applies to all other matters as well.

Marriage (*nikāh*) in Islam is a contract for the "legalization of intercourse and the procreation of children" and may be constituted without any ceremonial. It is purely a civil contract,

the terms of which depend on the will of the consenting parties, and is accompanied by payment of dowry which may be regarded as the price paid to the wife for the "connubial rights" of the husband.

The essential requirements of marriage are offer (*ijāb*) and acceptance (*qubūl*), expressed at one meeting. The declaration and acceptance may be made by the parties, or by their agents, if both are competent. In case of legal incompetency, the guardians may enter into a contract of marriage on behalf of their wards.

In Islamic law, a Muslim man who has attained majority (at 15) may marry any number of wives not exceeding four, but a Muslim woman can marry only one husband. A Muslim woman can only marry a Muslim, but a Muslim man may marry a Muslim woman or a Kitabiya, one who believes in a religion revealed to its followers in a book. There are seven limitations on the unfettered capacity of a Muslim man to marry; number of wives, religion, relationship (consanguinity or affinity), fosterage, unlawful conjunction, *iddat* (a period of continence imposed on a woman on the termination of a marriage in the interests of certainty of paternity), or miscellaneous prohibitions. (See also ISLAM: Muslim Society.) (J. Nr.)

Israel.—No marriage age is laid down in the Mosaic law, but 18 years is said by the rabbis to be the right age. An Israel statute has made it an offense to marry a girl under 17. Consent of parents of minors is not essential. Originally polygamy was common, but by decree of a famous rabbi of the 11th century it was prohibited to western Jews (Ashkenazim), and now in Israel to all. The Mosaic law prohibited marriage of many near relations, but allowed it between uncle and niece and with a deceased wife's sister. Marriage with cousins is more frequent among Jews than in the general community. The Levirate institution obliged a man to marry the childless widow of his deceased brother, but in modern times that is avoided by a ceremony of repudiation.

Marriage is a religious ceremony (*kiddushin*, meaning sanctification), with a civil contract (*ketuba*) attached. The ceremony consists of recitation of blessings, the drinking of wine, and the bridegroom's placing a ring on the forefinger of the bride's right hand. The ceremony takes place under a canopy (*huppa*), and there must be two Jewish witnesses, but the celebrant need not be a rabbi. After the blessing the bridegroom breaks with his foot a glass, symbolizing the destruction of the Jerusalem Temple. The civil part is the signing by the husband of an undertaking to provide a sum for the wife's maintenance. The marriage must be between Jew and Jewess, but either party may have been received into the Jewish community. (No. B.)

Asia and Africa.—Polygamous marriages are still permitted under customary laws in the republics of Africa and under tribal laws in the North East Frontier agency of India, while Islamic law sanctions limited polygamy. Monogamous marriages, however, are the only ones recognized in Japan and Ceylon, and in India for those countries not governed by Islamic law. In Pakistan the Muslim Family Laws ordinance, 1961, tried to restrict polygamous marriages and required a man to get permission before marrying a second wife and that all marriages be registered. In Africa there was a growing tendency for the younger generation to marry monogamously.

In Asian countries like Ceylon, India, Pakistan, and in the republics of Africa the major difference from western marriage law is that, with the exception of Japan, there is no uniform marriage law. Family relations are governed by the personal law of the citizens—a law based either on religion (as among Muslims or Hindus, irrespective of the country they belong to) or the customary law of the territory. This leads to a diversity of laws within one territorial unit and often gives rise to complex problems when, after marriage, one of the parties is converted to another religion.

In Africa and Asia, marriage commonly seals the coming together of two families. The marriage is arranged by the families and the girl is usually given away. This is symbolized in the *kanyadan* ceremony among the Hindus (giving of the daughter to the groom by her guardian) or the *tiri-aseda* under Ghanian Akan law, which is the thank offering by the groom to the person giving the bride in marriage.

The Indian Child Marriage Restraint act of 1929 (repeated in the Hindu Marriage act, 1955) tried to raise the age of marriage and prescribed penalties for its violation; but, because there are still so many child marriages, they have not been declared *ipso facto* void. In Nigeria marriage to a minor is likewise penalized. Under Islamic law in both Africa and Asia marriage is a contract, and therefore the consent of the parties is required; but, to give this consent, it is not necessary for the parties to have reached the age of majority but only the age of puberty, 15 years being the accepted age for both.

The payment of bride wealth (*q.v.*) to the bride's guardian as an essential of marriage is prevalent in many African marriages. In most places marriage cannot be consummated till the entire stipulated amount is paid; in Pondo and Zulu law, however, there is the modification that marriage payment can be demanded after consummation. In Natal, though not a requirement of the marriage, a payment is usual because the guardian's consent is required, and he withholds it till agreement has been reached.

A dowry, *mahr* in Islamic law, is paid to the bride as a token of respect, and both under that law and under African customary law it is an insurance against the husband's bad behaviour or divorce without cause. In India and Ceylon, the payment of a dowry—not for the bride but with her—became a social evil, and in an effort to stamp it out the India government passed the Dowry Prohibition act 1961, making the giving and receiving of dowries an offense. (See INDIAN LAW: Hindu Law.) (La. S.)

French-Speaking Central Africa.—The gathering together of various African societies under French authority has not really given them a legal unity, although a new code was expected in the early 1960s to achieve a relative unity. The decrees of June 15, 1939, and Sept. 14, 1951, established certain general characteristics: a minimum age for marriage, the nullity of marriages contracted by girls before puberty, the requirement of the consent of both parties, limitations on dowries and the remarriage of widows, etc. These rules have, however, done little to modify customary law; e.g., requirement of delay before a widow remarries, prevention of a child marrying its wetnurse, or children of the same nurse marrying, and limitations because of paternity.

The dowry has a wide usage and common characteristics: as a seal on marriage, authenticating the union and demonstrating that the woman is no concubine; and as a provision (paid in kind by the bridegroom) permitting the husband alone to exercise rights of paternity over children of the union. In principle the customary marriage is a union between two families in which the bride has no voice, though African women are now acquiring rights in this sphere. Marriage with a dowry is much more extensive than other forms (such as an exchange of gifts). Marriage "by abduction" is a ritual of formal significance only. Polygamy was formerly almost universal, all wives being equal. Generally customary unions do not involve the fusion of the inheritances of the two spouses. (J. L. P.)

China.—Under a civil code which came into operation in 1931 monogamy was ordained and bigamy forbidden, and if a bigamous marriage was contracted any interested party might apply to the court for annulment. This law still prevails in Formosa, although in practice the custom of concubinage continues and more than one wife is recognized. Formality in the marriage celebration was dispensed with, and all that was necessary was that the couple should declare themselves husband and wife before witnesses. Some of these signed their names on a large sheet of red paper, though this did not become a legal document. In the Chinese People's Republic a code was promulgated in 1950 ordering monogamy and that civil marriages be duly registered. Customary laws of marriage were abolished.

Japan.—Family relations were regulated by the law of Horei, 1896, which was reformed after the constitution of 1947, in the new civil code. Polygamous marriage was prohibited and an age of 18 years for the man and 16 years for the woman was laid down by law, though a minor marrying was decreed to have obtained his majority. Consanguinity was a prohibition to the third degree, and all marriages had to be registered in accordance with the Family Registration law.

MARRIAGE, PRIMITIVE. Human beings as higher animals multiply by the union of the sexes. But neither conjugation nor even the production of offspring is sufficient as a rule for the maintenance of the species. Advanced animals in the order of evolution tend to show extended immaturity and helplessness of the young and a need for prolonged care and training. It is thus the combination of mating with parenthood that constitutes marriage in such animals as man. Even in its biological aspect, "marriage is rooted in the family rather than the family in marriage" (E. A. Westermarck).

In human societies, however, other elements often are added to the sexual and parental sides of marriage: marriage is given the hallmark of social approval; it becomes a legal contract; it defines status and the relations among parents and children; it imposes duties of economic co-operation; it may have to be concluded in a public and solemn manner, receiving as a sacrament the blessings of religion and as a rite the good auspices of magic.

Human marriage also appears in a variety of forms: monogamy, polygyny and polyandry; matriarchal and patriarchal unions; households with patrilocal and matrilocal residence. Other forms, such as group marriage, promiscuity, anomalous or gerontocratic marriages, have been assumed by some writers as an inference from certain symptoms and survivals. In the 1960s these forms were not all to be found, while their hypothetical existence in prehistoric times is doubtful; it is important in such speculations never to confuse theory with fact.

Mid-20th-century field research revealed such forms as the Nuer (*q.v.*) marriage of a woman to a woman, inconsistent with the 6th edition of *Notes and Queries in Anthropology* (1951) that defined marriage as "... a union between a man and a woman such that children born to the woman are the recognized legitimate offspring of both partners."

E. R. Leach (1955) argued that the Nayar (*q.v.*) of the Malabar coast traditionally had no marriage in the strict sense of the term, since the notion of fatherhood was lacking; he proposed that marriage be defined in terms of some ten classes of rights establishing legal parenthood, control over sexuality, labour service, property and so on. If Leach's interpretation of the Nayar case is accepted none of these rights is established invariably by marriage. However, E. Kathleen Gough, on whose analysis Leach relied, re-examined the Nayar situation and concluded (1959) that "... the notion of fatherhood is not lacking and that marriage does serve to establish the legitimacy of children." But her data forced her to classify Nayar unions as a form of group marriage in which individual Nayar women were associated with a series

of men of appropriate caste. As a result of this and such practices as those among the Nuer she proposed a modified definition of marriage as "... a relationship established between a woman and one or more persons which provides that a child born to the woman ... is accorded full birth-status rights common to normal members of his society or social stratum."

Marriage in human culture is never a matter of entirely free choice. People related by descent or members of certain classes are often either barred from marrying each other or are expected to marry. The rules of incest, of exogamy, of hypergamy and of preferential mating form the sociological conditions of marriage. To these are added certain societies with such preparatory arrangements and conditions as initiation, special training for marriage and moral and economic tests that have to be satisfied before marriage is allowed.

Love and marriage are closely associated in daydreams and in fiction, in folklore and poetry, in manners, morals and human institutions—but marriage is more than the happy ending of a successful courtship. As an ideal it is the end of a romance; it is also the beginning of a sterner task, and this fact finds an emphatic expression in the laws and regulations of marriage throughout humanity.

Love tends to sexual intimacy and this to procreation. Marriage on the whole is rather a contract for the production and maintenance of children than an authorization of sexual intercourse. The main reason marriage has not been regarded uniformly as establishing an exclusive sexual relationship lies in the fact that in many human societies sexual relations are allowed under certain conditions before marriage, while marriage does not necessarily exclude the continuance of similar relations.

Marriage, however, remains the most important form of lawful intercourse, and it dominates and determines extra-conjugal liberties. In their relation to marriage the forms of licence include prenuptial intercourse, relaxations of the marriage bond, ceremonial acts of sex, prostitution and concubinage.

Prenuptial Intercourse.—In the majority of aboriginal tribes unmarried young people have been free to mate in temporary unions, subject to the barriers of incest and exogamy and of such social regulations as prevail. But there are other tribes where chastity of the unmarried is regarded as a virtue, especially in girls, and any lapse severely censured or punished. Many technologically primitive peoples such as the Vedda, Fuegians, Senoi and neighbouring Malayan Negritos reportedly did not tolerate sexual intercourse before marriage. Among the Bushmen and the Andamanese instances of prenuptial unchastity do occur, but they are not condoned, still less provided for by custom and moral approval. Aboriginal Australians, however, allow prenuptial freedom, except perhaps a few of the southeastern tribes.

Among less primitive aboriginals considerable variety is found in this respect. All over the world, in Oceania, in Asia, in Africa and in the Americas, examples are found of peoples who demand continence more or less stringently, yet have neighbours who allow full freedom. In only a few cases has the demand for chastity been found expressed in very definite usages that physically prevent copulation, such as infibulation practised among northeast African, Hamitic and Semitic peoples and reported also from Thailand, Burma and Java. The testing of the bride by a publicly exhibited token of defloration that forms part of certain marriage ceremonies and expresses the value of virginity lends itself to deception and circumvention. It has been found sporadically throughout the world, in the noble families of Oceania (Tonga, Samoa, Fiji), in Asia (Yakut, Koryak, Chuvash, Brahui of Baluchistan, southern Celebes), in North America (Chichimec of Mexico), in Africa (Mandingo, Ruanda, Yoruba, Swahili, Moroccan, Algeria and Egypt) and likewise among many Semitic and Hamitic peoples. In other parts of the world it is merely reported that chastity is praised and prenuptial intercourse censured (Bantu Kavirondo, Galla, Karanga and Bechuana of Africa; Dobu and Solomon Islanders of Melanesia; Omaha, Mandan, Nez Percé, Apache and Takelma of North America; Canelo of South America; Bodo Dhimial of Assam; hill Dayak of Borneo).

Freedom to mate at will has been fully allowed and even en-

joined and provided for by such institutions as mixed houses for bachelors and girls (Trobriand Islanders, Nandi, Masai and Bontok). In some communities prenuptial intercourse is not meant to lead to marriage, and there even have been cases (as among the Masai, Kunbi of India, Guaycuru and Guana of Brazil), where prenuptial lovers were not supposed to marry. Elsewhere prenuptial mating is a method of courtship by trial and error leading gradually into stable unions, and is finally transformed into marriage. Thus among the Trobriand Islanders considerable sexual freedom has been observed. It begins very early, children taking a great deal of interest in certain pursuits and amusements that come as near sexuality as their unripe age allows. This is by no means regarded as improper or immoral, is known and tolerated by the elders and is abetted by games and customary arrangements. Later on, after boys and girls have reached sexual maturity, their freedom continues with the result that there is a great deal of indiscriminate mating. In fact, at this age both sexes show a great deal of experimental interest, a tendency to vary and to try, and here again a number of arrangements and customs play into the hands of these juvenile lovers. As time goes on, however, and the boys and girls grow older, their intrigues naturally and without any outer pressure extend in length and depth, and the ties between lovers become stronger and more permanent. One decided preference as a rule develops and stands out against the lesser love affairs. It is important to note that such preferences are clearly based on genuine emotional attachment. The protracted intrigue becomes a matter of public notice as well as a test of mutual compatibility; the girl's family signify their consent and marriage is finally concluded between the two lovers. Similar forms of prenuptial selection have been found in other tribes (Igorot of Luzon, Kamba of Kenya and Tiv of Nigeria).

However, prenuptial liberty is not regarded by these groups as a negation of or substitute for marriage. In fact in such communities it is in the nature of a preliminary or preparation to marriage; it allows the young people to sow their wild oats, eliminates cruder forms of sex impulse from matrimonial selection and often leads to a mature choice that considers attractions beyond sexual appeal.

The Principle of Legitimacy.—Perhaps most important in the consideration of prenuptial liberty is the rule that freedom of sexual intercourse does not generally extend to freedom of procreation. One of the symptoms of this is that in communities where chastity is demanded and enforced, deviation entails more censure on girls than on boys, while prenuptial pregnancy is penalized much more severely than mere wantonness. But even where prenuptial intercourse is enjoined by tribal law pregnancy is often regarded as a disgrace.

Among such aristocratic fraternities of Polynesia as the Areoi of Tahiti licence between men and women was universal, but children of such unions were killed unless adopted by a married couple. Among the Melanesian communities of New Guinea and the adjacent archipelago that allow full sex liberty before marriage, the occurrence of pregnancy under such circumstances is a grave disgrace to the mother and entails disadvantages for the child. The Masai punish a girl for prenuptial pregnancy, although free unions of unmarried boys and girls have been traditional with them. A similar combination of prenuptial full licence with severe punishment of illegitimate childbirth is recorded from several African tribes (Nkole, Basoga, Kikuyu, Nandi, Beni Amer), from the Americas (Indians of British Guiana, Guaycuru, Guana, Creek and Cherokee), from Asia (Lisu of Burma, Nias Islanders of Indonesia and Siberian Aleut), from Melanesia (Solomon Islanders). In such cases pregnancy probably is prevented by contraceptive practices for which few reliable reports are available from primitive tribes; or by abortion, which is far more frequent; or is expiated by punishment of the mother and sometimes also of the father.

The main sociological dictum embodied in these rules and arrangements is that children are not to be produced outside a socially approved contract of marriage. In several tribes the remedy for the disgrace of a prenuptial child has consisted therefore in an obligation of the presumptive father to marry the girl (Bantu, Madi, and Kagoro of Africa; Tepehuane and Hupa of North

America; Kachari of Assam; Kayan and Punan of Borneo). In some cases a child of a free union is a condition to marriage which is concluded upon its birth (Sea Dayak, hill Dayak, Moi and Bontok of Malaysia; natives of the Bismarck archipelago; Lengua, Guarayo and Pueblo Indians of the Americas; Wolof and Bambata of Africa). Such cases, although they contrast with those in which a prenuptial child is a disgrace, involve the same principle; the elimination of illegitimate offspring. As a matter of fact, where prenuptial pregnancy is welcomed, children are regarded as an advantage. The father consequently need not be forced to marry the mother; he does so of his own accord, usually because fruitful marriage is desirable. Thus a socially recognized father commonly is regarded as indispensable for each child, *i.e.*, a husband for each mother. An illegitimate child typically is an anomaly, whether it be an outcast or an unclaimed asset. A group consisting only of a woman and her children is a legally incomplete unit.

Relaxations of the Marriage Bond.—Among tribes where prenuptial chastity is demanded marital fidelity is also usually enjoined. As a rule adultery is regarded as a grave offense and more severely penalized than prenuptial intercourse, though exceptions to this rule do exist. In many communities where freedom was granted before marriage, as soon as the matrimonial knot was tied both partners, or the wife at least, were bound to remain faithful, under more or less serious penalties (Trobrianders, Nukuhiva and Maori of Oceania; Land and Sea Dayak, Kuki and Ceramese of Indonesia; Botocudo and Guarayo of South America; Illinois, Comanche, Iroquois, Pawnee and Californian Indians of North America; Temne, Ashanti, Konde, Zulu, Kaffir and Thonga of Africa). The penalty inflicted upon an adulterous wife tends to be much graver than upon an unfaithful husband, and considerable differences prevail according to the circumstances of the offense, the status of the third party, the husband's anger and his attachment to his wife.

There are, however, a number of communities that permit promiscuity with the consent of the marital partners and with the sanction of tribal law, custom and morality. In some societies the only occasion on which the wife is allowed connection with other men, indeed must submit to their embraces, is at the very beginning of marriage. This custom has apparently been known in medieval Europe under the name *jus primae noctis* (*droit du seigneur*). It has been reported in many aboriginal cultures (Brazilian Indians, Arawak, Carib, Nicaraguan and Tarahumara of South and Central America; Ballante and Berber of Africa; Banaro of Melanesia; Arunta, Dieri and other Australian tribes). Such customs are to be regarded not so much as the abrogation of matrimonial exclusiveness, but rather as expressing the superstitious awe with which sexual intercourse, and above all defloration, is regarded by some primitive peoples. As such these customs should be considered side by side with the numerous instances in which girls are artificially deprived of their virginity, without the intercourse of any man; with prenuptial defloration by strangers; with temporary prostitution of a religious character; and with sexual intercourse as a puberty rite.

A greater encroachment upon sexual exclusiveness in marriage is found in the custom of wife lending as a form of hospitality; this has been very widely distributed. It must be realized that this practice is not an infringement of the husband's rights, but rather his assertion of authority in disposing of his wife's person. Very often indeed a man will offer his sister, daughter, slave or servant instead, a fact indicating that this custom is not so much the right of another man to infringe upon the matrimonial bond as it is the right of the head of the household to dispose of its female inmates.

Very often sexual hospitality has been exercised in anticipation of future reciprocal benefits, and must be considered along with the custom of wife exchange (Gilyak, Tungus and Aleut of Asia; Bangala, Herero, Kamba and Yao of Africa; various Himalayan and Indian tribes; in the Marquesas Islands, Hawaii and among the Maori of Polynesia; and various Australian tribes). At times there has been an exchange of wives at feasts, when general orgiastic licence prevails (Araucano, Bororo, Keres, Arapaho, Gros Ventres and Lower Mississippi tribes of the Americas; Dayak and

Jakun of Indonesia; Hos and Kota of India; Ashanti, Ekoi and various Bantu tribes of Africa; Kiwai Papuans). On such festive and extraordinary occasions not only are sexual restrictions removed, and the sexual appetite stimulated, but ordinary discipline is relaxed, normal occupations abandoned and social barriers overridden, while at the same time people indulge in gluttony, in amusement and social intercourse. Sexual licence, as well as the other relaxations, liberties and ebullitions at such feasts, fulfills the important function of providing a safety vent that relieves normal repressions, furnishes people with a different set of experiences, and thus tends to safeguard ordinary institutions.

These cases where wives are exchanged only for sexual intercourse must be distinguished from the less frequent instances of more or less legalized prolonged exchange with common habitation. W. H. Gilder reported that among the Eskimos of Repulse Bay, "If a man who is going on a journey has a wife encumbered with a child that would make travelling unpleasant, he exchanges wives with some friend who remains in camp and has no such inconvenience. Sometimes a man will want a younger wife to travel with, and in that case effects an exchange, and sometimes such exchanges are made for no special reason, and among friends it is a usual thing to exchange wives for a week or two about every two months." Analogous forms of prolonged exchange have been found among certain tribes of southern India, while among the Siberian Chukchi it has been recorded that a man will often enter into a bond of brotherhood with those relatives who dwell in other villages, and when he visits he will be given access to his relative's wife, presently receiving a return visit in order to make the obligation mutual; sometimes cousins exchange wives for a prolonged period.

Again, among the Dieri and cognate tribes of central Australia, a married woman may be placed in the so-called *pirrauru* relationship to a man other than her husband. Such a man may, with the husband's permission, have access to her on rare occasions. Or if the husband is absent and gives his consent the woman may join her paramour for some time at his camp, but this is apparently rare. In order to lend his wife in this way a man must wait until she is allotted by the tribal elders as the *pirrauru* to another man. Then he may consent to waive his marital rights for a short time, though he is under no constraint to do so. Circumstances, jealousy, even the disinclination of the woman are obstacles that must make *pirrauru* extremely rare. This custom has been adduced as an occurrence of group marriage, but some authorities disagree, since it is always a temporary and partial surrender of marital rights with only rare episodes of extramarital liaison.

It is important to remember that marriage has come to be regarded as defined primarily by parenthood. Social parenthood in primitive ideas, behaviour, custom and law is not affected by the various forms of relaxation just described. The children are reckoned as belonging to the legal husband, and in this as in many other ways, *i.e.*, economic, legal and religious, these temporary relaxations do not seriously disturb the primitive marriage relationship. It must be realized with regard to fatherhood that even where the main principles of physiological procreation are known, many primitive peoples do not attribute undue importance to actual physiological paternity (*see* KINSHIP). It is almost always the husband of the woman who is considered the legal father of her children, whether he is their biological father or not.

Concubinage.—This can be defined as a legalized form of cohabitation that differs from marriage in that it implies a considerably lower status of the female partner and her offspring than that enjoyed by the legal wife. It is a terminological confusion to speak of concubinage when there is temporary access to a woman or exclusively sexual rights to her. On primitive levels of culture real concubinage has not been observed. Some similarity to it can be found in the institution of subsidiary wives. In certain polygynous communities there is one principal wife and the subsidiary ones have a much lower status, as has been the case among the Guarani, Eskimos, Araucanians, Apache and Chippewa (the Americas); Chukchi, Koryak and Yakut (Asia); Marquesas Islanders, Tongans, Tahitians, Maori and Marshall Islanders (Polynesia); Bemba, Wafipa, southeastern Bantu, Herero, Nandi

and Yoruba (Africa); Osset (Asia); Bagobo and Kulaman (Philippines).

The institutions of temporary and limited partnership described above, such as the *pirrauru* of Australia or the protracted exchange of partners among the Eskimos, should not be regarded as concubinage.

Prostitution.—The institution of commercial eroticism or prostitution has a very limited range among primitive peoples. It has been reported from Oceania (Santa Cruz Islands, Rossel Island, Line Islands, Caroline Islands, Easter Island and Hawaii), Greenland, North America (Omaha), South America (Witoto and Boro) and Africa (Nyoro). In its relation to marriage it begins to play a very important part only in more advanced cultures (*see* PROSTITUTION). On the one hand it provides an easy satisfaction for the sexual appetite to unmarried men or to those who for some reason cannot cohabit with their wives. It thus constitutes an institution complementary to marriage. On the other hand, in certain communities, of which ancient Greece was a notable example, prostitution in a higher and more refined form (*hetæris*) allowed some women to devote themselves to cultural pursuits and to associate with men more freely than was possible to those legally married.

In general prostitution is rather a subsidiary institution than either a relaxation or a form of sexual preparation. Unlike other forms of sexual licence, prostitution is neither directly correlated with marriage nor does it affect its integrity so seriously as does relaxation of marital bonds that involve both partners.

The Economics of the Household and Family.—Empirically, it appears that the institution of marriage is primarily determined by the needs of the offspring, by the dependence of children upon their parents. Since she is handicapped at pregnancy and for some time after birth the mother needs the assistance of a partner. The role of associate and helpmate is almost universally played by the husband exclusively; exceptions include some extremely matrilineal societies where the wife's brother shares with the husband in some of the responsibilities and burdens of the household. The economic as well as the biological norm of a family is thus mother, child and husband—or exceptionally both the husband and the wife's brother. (*See* FAMILY.)

In the vast majority of human societies the individual family, based on monogamous marriage and consisting of mother, father and children, forms a self-contained group. Within the household there is a typical scheme of division in functions; by virtue of natural endowment the wife not only has to give birth to and nourish the children, but also is destined to give them most of the early tender cares: to keep them warm and clean, to lull them to sleep and soothe their infantile troubles. Even in this the husband often helps to a considerable degree, prompted by natural inclination as well as by custom. The latter often imposes upon him duties and ritual manifestations such as tabus during pregnancy and at childbirth, and performances at the time of confinement, of which the *couvade* (*q.v.*) is a striking example. All such obligations emphasize the father's responsibility and his devotion to the child. Later on in the education of offspring both parents commonly have to take part, performing respective duties that vary with the society and the sex of the children.

Apart from the special task of producing and rearing children, the wife in primitive marriage normally looks after food preparation; she almost invariably provides fuel and water, is the actual attendant at the hearth or fireplace, manufactures, tends and owns the cooking vessels, and she is typically the main carrier of burdens. In the very simplest cultures the woman also erects the hut or shelter and looks after camp arrangements (Australian aborigines, Bushmen and Andaman Islanders). The husband generally is the protector and defender of the family, and he also performs work that requires greater strength, courage and decision, such as hunting game, fishing, heavy building of houses and craft, and clearing timber.

The division of labour between husband and wife outside the household differs with the community, but on the whole makes fighting, hunting, sailing and metalworking male occupations; collecting, agriculture, pottery and weaving predominantly female oc-

cupations; while fishing, cattle tending, making of clothing and utensils are done by one sex or the other according to culture. The Tchambuli of New Guinea, as an exception, have tended to reverse the typical male and female roles.

The division of labour outside the household means also as a rule that each parent has to collaborate with other community members of the same sex in some wider collective enterprise, from which the family benefits only partially and indirectly. In spite of repeated theoretical assertions as to the existence of the closed household economy or even of individual search for food among primitive peoples, every community, however simple, displays a wider economic collaboration embracing all members and welding the various families into larger co-operative units.

The fuller the knowledge of relevant facts, the better is seen on the one hand the dependence of the family upon the rest of the community, and on the other hand the duty of each individual to contribute not only to his own household but to those of others as well. Thus in primitive Australia a great part of a man's yield in hunting has to be divided according to fixed rules among his immediate and classificatory relatives. Throughout Oceania a network of obligations unites the members of the community and overrules the economic autonomy of the household. In the Trobriand Islands a man traditionally has been required to offer about half of his garden produce to his sister and another part to various relatives, only the remainder being kept for his own household, which in turn is supported substantially by the wife's brother and other relatives. Economic obligations of such nature cutting across the closed unity of the household are uniformly encountered.

The most important examples however come from communities organized on extreme mother right, where husband and wife are in most matters members of different households, and their mutual economic contributions are in the nature of gifts rather than of mutual maintenance.

The Split Household Under Matrilocal Mother Right.

Most of this discussion so far has dealt with marriage based on a united household and associated as a rule both under father right and mother right with patrilocal residence. This means that the bride moves to the husband's community when she either joins his family house or camp or else inhabits a house built for the new couple and owned in the husband's name. Patrilocal marriages are by far the most prevalent.

Matrilocal marriage consists in the husband's joining the wife's community, taking up residence in her parents' house and often having to do some services for them. Matrilocal residence may be permanent; or it may be temporary, the husband having to remain for a year or two with his parents-in-law, and having also possibly to work for them (Eskimos, Kwakiutl, Guaycuru and Fuegians of the Americas; Bushmen, Hottentots, Bapedi, and Nuer of Africa; Negritos of the Philippines; Ainu of Japan).

In a few cases that might be regarded as the extreme development of mother right combined with matrilocal conditions the wife remains at her mother's residence and the husband does not even take up a permanent abode there, but simply joins her as a frequent and regular but still temporary visitor (Menangkabau of Sumatra, Nayar of Malabar). Such extreme cases of mother right are an exception. They are the product of special conditions found as a rule at a high level of culture and should not be taken as the prototype of primitive marriage.

A most important fact is that even in such extreme matriarchal conditions the principle of social legitimacy holds; though the father is domestically and economically almost superfluous, he is legally indispensable and the main bond of union between such matrilineal and matrilocal consorts is parenthood. It is also seen that the economic side can have a symbolic, ritual significance—the gift exchange functions as token of affection—thus marking a sociological interdependence, while it has hardly any utilitarian importance.

Marriage as an Economic Contract.—While marriage embraces a certain amount of economic co-operation as well as sexual connubium, it is not primarily an economic partnership any more than a merely sexual appropriation. It is as necessary to guard against an exclusively economic definition of marriage as against

the overemphasis on sex. Marriage is not entered upon for economic considerations, exclusively or even mainly; nor is the primary bond typically established by mutual economic benefits. This is shown by the importance of matrimonial bonds even where there is no community of goods nor co-operation nor even full domesticity. Economics are a means to an end: the rearing, education and parental influence over the offspring. Economic co-operation is one of the obligations of marriage and like sexual cohabitation as well as mutual assistance in legal and moral matters, it is prescribed to the married by law and enjoined by religion in most cultures. But it certainly is neither the principal end nor the unique cause of marriage.

Marriage by Purchase.—As unwarranted as the overemphasis on economics and its hypostasis as the essence of marriage is also the tearing out of some one economic trait and giving it a special name and thus an artificial entity. This has been done notably with regard to the initial gifts at marriage, especially when given by the husband. More or less considerable gifts from the husband to his wife's family at marriage occur very widely. The term "marriage by purchase" applied to such gifts usually serves to isolate them from their legal and economic context, to introduce the concept of a commercial transaction that is not found in primitive culture as a part of marriage and to serve as one more starting point for unverified speculations about the origin of marriage.

The presents given at marriage should be considered as a link—sometimes very important, sometimes insignificant—in the series of services and gifts that invariably run throughout marriage. The exchange of obligations embraces not only the marital partners, but also the children, who under mother right are counted as one with the mother while under father right they take over the father's obligations. The family and clan of the wife, and more rarely of the husband, also become part of the scheme of reciprocities. The presents offered at marriage by the husband are often made up of contributions given him toward this end by his relatives and clansmen (Thonga, Zulu, Xhosa, Tswana and Madi of Africa; Toradja of Indonesia; Trobrianders of Melanesia), and are not all retained by the girl's parents but shared among her relatives and even clansmen (Achomawi, Delaware, Osage and Araucanians of the Americas; southeast Bantu, Swahili, Pokomo, Turkana, Bavili, Baganda, Masai and Lotuko of Africa; Osset, Samoyed, Aleut, Yakut and Yukaghir of Siberia). The giving of presents is thus a transaction binding two groups rather than two individuals, a fact reflected in such institutions as the inheritance of wives, sororate, levirate and so on. An understanding of the initial marriage gift should be obtained against the background of the wider economic mutuality of husband and wife, parents and children and maternal and paternal families and clans.

Another type of marriage gift is found among the patrilineal and patrilocal communities of the southeast Bantu, who live by combined agriculture and cattle raising. The wife and children are here regarded as definite economic and social assets. The wife is the main agricultural and domestic worker, while the children are valuable because the boys continue the line and the girls bring in wealth at marriage. Marriage is concluded by the payment of cattle, the amount varying greatly according to tribe, rank and other considerations from a few head to a few score. These cattle are known as lobola, or bridewealth (*q.v.*). The lobola in fact is not the motive for the transaction, nor is there any bidding on any market, nor can the cattle be disposed of at will by the receiver, *i.e.*, the girl's father. Some of them have to be distributed by him according to fixed tribal custom among particular relatives of the girl; the rest he has to use for the provision of a wife for his son, *i.e.*, the girl's brother, or else, if he has no male heir, he contracts another wife for himself in order to obtain the desired male descendants. In case of divorce the marriage gift has to be returned as the identical cattle given and not merely in an equivalent form. The lobola is thus rather a symbolic equivalent representing the wife's economic efficiency, and it has to be treated as a deposit to be spent on another marriage.

In Melanesia the husband's initial gift at marriage is a ritual act required to be reciprocated by the wife's family. This has been the case also among certain American tribes (Tsimshian, Coast

Salish, Bella Coola, Delaware, Ojibwa, Navaho and Miwok); in Siberia (Mordvin, Ainu, Buryat, Samoyed and Koryak), and in Polynesia (Samoa). This return gift may take the form of a dowry given to the bride by her father or parents or other relatives but also directly or indirectly benefiting her husband (Greenlanders; Brazilian aborigines and Yahgan of South America; Ibo, Ovambo, southeast Bantu, Banyoro and Masai of Africa; Buryat, Yukaghir and Samoyed of Siberia; Toda of India; Banks Islanders and Maori of Oceania). In some communities the balance of gifts is so much in favour of the husband that instead of wife purchase one could speak of buying a husband for the girl (coast tribes of British Columbia; Tehuelche of Patagonia; Yakut).

Property and Inheritance Within Marriage.—As a rule the marital partners have not only their own sphere of activity but their own possessions. The wife usually claims the title and right of disposing of her articles of apparel, of the domestic utensils and often of the special implements and fruits of her pursuit. The importance of woman's work in agriculture, her social influence due to this and her specific claims to the agricultural produce—not the ownership of the land, which generally is vested in men—have given rise to the economic theory of mother right.

Very often the possessions of the husband and wife are inherited by their respective kindred, and not by the surviving partner. The inheritance of the wife by the husband's brother (the custom of levirate; *q.v.*) that is known from the Old Testament but has a fairly wide range of distribution should not be regarded as an economic transaction. Like the suttee once common in India, the inheritance of a widow under mother right and like the custom of killing the widows, it is the expression of the matrimonial bonds outlasting death, and defining the widow's behaviour afterward.

Marriage as a Legal Contract.—Marriage is no mere cohabitation, and in no society are people expected to share life in common and produce children without having the approval of the community. This is commonly obtained by going through legal and ritual formalities that constitute the act of marriage, by accepting in this the obligations entailed in marriage and the privileges it gives, and by having later on to submit to the consequences of the union as regards children.

The legal side of marriage is therefore not made up of such special activities as constitute its sexual, economic, domestic or parental aspects. It is rather a special way of treating these aspects that makes them defined by tradition, formally entered upon and made binding by special sanctions.

First of all, the whole system of obligations and rights that constitute marriage is in each primitive society laid down by tradition. The way in which people have to cohabit and work together is stipulated by tribal law: whether the man joins his wife or vice versa; whether and how they live together, completely or partially; whether the sexual appropriation is complete, making adultery in either partner an offense, or whether, subject to certain restrictions, there may be waiving of the sexual rights; whether there is economic co-operation and what its limits are. The details and the typical rules and variations have already been discussed, as well as the ways in which the rules are enforced. But it must be added that knowledge is quite limited concerning why rules are kept, how they are enforced and how they are evaded or partially broken.

Only on one or two points do ethnographic observers habitually report: what penalties attach to a breach of law and custom and what premiums are set on their careful and generous observance. Thus, information often is given on how adultery is dealt with, though accounts of the severity of the law on this point are usually exaggerated. Again, to anticipate, incest and exogamy are usually surrounded with definite sanctions, some social and some supernatural. The manners and morals of daily contact within the household are usually laid down and enforced by that complicated and imponderable set of forces that governs human behaviour in its everyday aspects and makes people distinguish between proper and improper form in every human society. The validity of the economic duties of husband and wife is as a rule based on the fact that the services of the one are conditional on the services

of the other, and that a very lazy or unscrupulous partner tends eventually to be divorced by the other.

Divorce.—Marriage is as a rule concluded for life—at times beyond death as mentioned above. It is questionable whether the short-period marriages reported from isolated districts (Eskimos of the Ungava district in Canada, some tribes of the Indian archipelago, Arabia, Iran and Tibet) deserve the name of marriage, *i.e.*, whether they should not be put into a different sociological category; but accounts of them are too slight to allow of deciding this question. In some tribes it is reported that marriage is indissoluble (Vedda, Andamanese, certain tribes of the Indian archipelago and Malay peninsula). The general rule, however, is that divorce among primitive peoples is possible but not easy and entails damages and disabilities to both partners. Even where divorce is said to be easy for either partner it is found on further enquiry that a considerable price has to be paid for the liberty to divorce, that it is easy only to exceptionally powerful or successful men and women, and that it involves in most cases loss of prestige and a moral stigma. Also, divorce tends to be easy only before children have been born, and it becomes difficult and undesirable after their arrival. In fact the major basis for primitive divorce, besides adultery, economic insufficiency or bad temper, is sterility in the wife or impotence in the husband. This emphasizes the aspect of marriage as an institution for the preservation of children.

The threat of divorce and of the disabilities it entails act to keep husband and wife to their prescribed conduct. At times the husband is kept in check by the marriage payment which he can reclaim only when the union is dissolved through no fault of his. At times the considerable economic value of the wife is an important motive for good and dutiful conduct.

The Status of Husband and Wife.—The duties of the wife toward the husband are in some primitive communities apparently enforced to a considerable extent by his personal strength and brutality, and by the authority given him by custom. In others, however, husband and wife have almost equal status. Unfortunately, ethnographic accounts too often contain such generalities and stock phrases as "the wife is regarded as the personal property of the husband," "his slave or chattel," or "the status of the wife is high." An adequate definition of status requires a full enumeration of mutual duties, of the limits to personal liberty established by marriage and of the safeguards against the husband's brutality or neglect, or against the wife's shrewishness and lack of sense of duty. It is often held that mother right and the economic importance of woman's work, especially in agricultural communities, go with a high social status of the wife, while in collecting, nomadic and pastoral tribes her status is on the whole lower.

Marriage not only defines the relations of the consorts to each other, but also their status in society. In most tribes, marriage and the establishment of an independent household are a condition for the attainment of the legal status of full tribesman in the male and of the rank and title of matron in the woman. Under the system of age sets (*q.v.*) the passage through certain initiation rites is a condition of marriage. In all tribes, however, all normal and healthy tribesmen and women are under constraint to be married, and even widows and widowers remarry if they are not too old, under the penalty of losing some of their influence. The attainment of a full tribal status is always a powerful motive for marriage.

The Laws of Legitimate Descent.—Marriage affects not only the status of the consorts and their relations, but imposes also a series of duties on the parents with regard to children, and defines the status of children by reference to the parents.

In virtue of the universal principle of legitimacy, the full tribal or civil status of a child is obtained only through a legal marriage. Legitimacy is at times sanctioned by penalties that devolve on the parents, at times by the disabilities under which illegitimate children suffer, at times by inducements for the adoption of children or for their legitimization by the presumptive father or some other man.

In this connection it should be realized that children are expected to return in later life some of the benefits received earlier. The aged parents tend to be dependent on their children, usually

on the married boys. Girls at marriage often bring some sort of emolument to their parents and then continue to help and look after them. The duties of legal solidarity also devolve on the children, uniting them to father or to mother according to whether the primitive society is patrilineal or matrilineal.

One of the most important legal implications of marriage is that it defines the relation of the children to certain wider groups: the local community, the clan, the exogamous division and the tribe. The children as a rule follow one of the parents, though more complex systems also exist and the unilateral principle of descent is never absolute (*see* KINSHIP).

Modes of Concluding Marriage.—In studying the legal aspect of marriage, it should be realized that the matrimonial contract never derives its binding force from one single act or from one sanction. Different modes of concluding marriage often have been given special genetic importance or legal value in discussing the origin of the institution. Marriage has in turn been speculatively derived entirely from mere subjugation by brutal force (the old patriarchal theory); from appropriation by capture in foreign tribes (J. F. McLennan's hypothesis); from feminine revolt against heterism (J. J. Bachofen); from economic appropriation or purchase (the materialist interpretation of early marriages); from pithecanthropic patriarchy (J. J. Atkinson, S. Freud); and from the power of mothers (R. S. Briffault). All these views overstate the importance of one aspect of marriage or even of one element in the modes of its conclusion; some even invent an imaginary state or condition.

Empirically, marriage is a most important legal contract in human society, one that refers to the continuity of the race; it implies a most delicate and difficult adjustment of a passionate and emotional relationship with domestic and economic co-operation; it involves the cohabitation of male and female, perennially attracted and yet in many ways incompatible; it focuses in a difficult personal relationship the interest of wider groups: of progeny, parents, kindred and in fact of the whole community.

The validity of the marriage bond derives its sanctions from all these sources. The complexity of motives for which it is entered, the utility of the partners to each other, their common interest in the children's welfare and the interest kindred and community have in the proper upbringing of offspring—these emerge as foundations of marriage and its legally binding character.

All this finds an expression in the modes of contracting marriage. These always contain the element of public approval; the collaboration of the families and the kindred of each partner; some material pledges and securities; some ritual and religious sanctions; and the consent of the parties concerned.

In the old manuals and statements concerning marriage an important place usually is taken by a classical list of the various modes of conclusion: marriage by capture, by purchase and by service, by infant betrothal, elopement, exchange, mutual consent and so on.

This classification as a rule exaggerates one aspect out of all proportion, and attributes to this one aspect an overwhelming influence on the whole institution. Marriage by purchase already has been dismissed as a crude misnomer, while service is but a detail in the economics of certain marriages. Marriage by capture, which has played such a prominent part in speculation and controversy from McLennan onward, never could have been a real institution. Though a man may occasionally wed a woman captured by force, such an occurrence is an exception; there is no evidence that it ever was a rule, still less a stage in human evolution. Tribal endogamy (*see* below) is essentially universal. Ceremonial fights and ritual capture occur at wedding ceremonies over a wide area but they can be interpreted in terms of immediate psychology and of existing social conditions (Westermarck, Briffault, Havelock Ellis). To regard them as survivals of marriage by capture is without basis and on this point there was in the 1960s almost universal agreement. Capture and violence, as well as purchase from other tribes or on the slave market, lead to concubinage and at times provide prostitutes, but only very rarely do they supply legal wives.

Like the contract itself, modes of concluding marriage involve

a great variety of binding and determining factors. But a real distinction still can be made among those marriages contracted primarily by rules of tradition; those arranged by the families or kindred of the consorts; and those that arise by choice of the mates. In no type of marriage is any of these three elements—tradition, arrangement by families or their consent and mutual choice—completely absent. But one or another may predominate conspicuously.

The most usual type of traditionally prescribed union is cross-cousin marriage (*see* COUSIN MARRIAGE), with a wide distribution and reported practised very extensively all over Oceania, Australia and southern India, and sporadically in Africa, North America and Asia. The marriage of parallel cousins is less frequent, and has been found notably among Semitic peoples. Even less common are marriages prescribed between other classes of relatives, *e.g.*, between a man and his brother's daughter (northern Australia, some parts of Melanesia), or his sister's daughter (southern India), or his father's sister (certain parts of Melanesia and the Athapaskan Tinnah of North America). Another type of prescribed marriage is by inheritance, of which the levirate and sororate (*qq.v.*) are the most notable.

Besides such traditionally defined unions, there are also marriages recognized as convenient and desirable by the respective families and arranged by them. Infant betrothal (prevalent in Australia and Melanesia) in which a definite claim is established, or infant marriage (reported especially from India) where the bond is effectively concluded, are two of the most usual forms. The main motive for infant unions is the determination of families to secure a convenient union. In aboriginal Australia, where an infant is often allotted to a mature male, the power of old men and their keenness to secure young wives are at the root of this institution. Whether such marital gerontocracy still survives or even ever existed in Africa is problematical.

In many communities, including some advanced nations of Europe, marriage has been mainly determined by social or financial considerations, and in this the parents of the bride and bridegroom have as much to say as the two people directly concerned. In some primitive tribes two brothers exchange sisters (Australia), or a man's matrilineal uncle or patrilineal aunt has some say (Melanesia). Where the initial payments are very heavy and where they are used to secure a wife for the bride's brother marriage is usually also a matter for an arrangement rather than personal choice.

Nevertheless, mutual choice remains the most important element. Very often an infant betrothal or some other form of arranged union is broken by one of the people directly affected, and marriage by elopement with the subsequent consent of family and kindred overrules other considerations. Invariably in primitive communities the majority of unions come from the initiative of the partners. Marriage by mutual choice is the norm and the choice is determined largely by personal attraction; this does not mean only sexual or erotic attraction. In general the physical appeal combines with psychological compatibility and such social considerations as suitability of rank, occupation and economic benefits. Here again the nature of marriage entails a complexity of motives and its stability is secured by a suitable compromise between conflicting interests.

Religious and Ceremonial Aspects of Marriage.—The sanctity of the marriage bond is not found merely in the Christian religion nor is it a prerogative of the more technologically advanced cultures. The supernatural sanction, derived from a solemn public ceremony, adds to the binding forces of mere law. Marriage is valid as a legal contract insofar as its breach incurs worldly retributions and its generous fulfillment carries worldly benefits. As a sacrament, marriage in primitive and advanced societies alike is believed to be protected by spiritual powers that reward those who observe matrimonial duties meticulously and piously, and punish those who neglect them.

The religious side of marriage is therefore closely akin to the legal in that it adds to the validity and sanctity of other functions. It finds expression in acts of establishment and those of dissolution: religious rites are found at betrothal and wedding, while

divorce is often religiously defined and qualified, and at death the breach of the bond finds its spiritual expression in the duties, observances and ceremonies incumbent on the surviving partner. Besides ceremonial manifestations in which the bonds of marriage are religiously tied or dissolved, religious ethics establish rules of matrimonial conduct that are believed to be sanctioned supernaturally or are felt binding through their appeal to moral sense rather than to self-interest.

Ceremonies of Betrothal and Wedding.—Betrothal can be defined as an act preliminary to marriage, establishing mutually presumptive claims. The period between betrothal and marriage varies, and where it is short it is often difficult or even impossible to decide whether it is an act of betrothal or an inaugural wedding rite. It is also unprofitable to draw a very sharp line of distinction between infant betrothal and infant marriage. Where betrothal imposes real obligations and a valid tie, the rites then observed usually fulfill the same function as those of marriage. Therefore the binding rites of marriage and betrothal will be discussed together.

These rites and ceremonies cover a very wide range: from the simplest act such as a meal openly taken in common to complex and elaborate tribal festivities extended over a considerable period of time. But in every human society marriage is usually concluded by a ritual enactment. It might be disputed whether such rites in their simplest form present a genuine religious character; but most sociologists would agree that they always have some religious elements in that they are solemn and public; in their more elaborate form they tend to become definitely religious.

"The most general social object" of a wedding rite is "to give publicity to the union" (Westermarck). By this the legal as well as religious sanction of the union is established. The contract is made binding in that members of the community bear witness to it; it is hallowed in that the mates solemnly and openly declare before man and deity or other spiritual powers that they belong to each other. A marriage rite as a rule is also a ritual act with symbolic significance, and as such is often conceived to have magical efficacy, to contain a moral precept or to express a legal principle.

Biological Symbolism.—Thus the fundamental purpose of marriage, the continuity of the race, is indicated in wedding ceremonies by ritual intended to make the union fruitful, to obviate the dangers associated with sexual intercourse, especially with defloration, and to facilitate the various stages of the process of generation from the first act to delivery. Among the fertility rites a prominent place is taken by fruit or grain sprinkled over the newly wedded couple or on or round the nuptial bed, handed to them or brought into contact with them in some other way. Such rites as the accompaniment of the bride by a little child, the use of various symbols of generation and the direct offering of prayers and sacrifices are intended to make the union fruitful. The breaking of some object at the wedding is held to avert the dangers of defloration and to facilitate the consummation of the union. The untying of knots and laces found in many wedding rites is believed to make for easy delivery at childbirth. These acts express the biological nature of marriage.

Marriage as a Crisis.—As an official and public recognition of a biological fact, as perhaps the most important contract ever entered by the marital partners and as an act that creates a new family, marriage is a crisis. A crisis in human life is surrounded by powerful emotions: forebodings and hopes, fears and joyful anticipations. Innumerable rites exist that are obviously intended to remove the dangers associated with the crisis of marriage.

Dangers apprehended in subjective forebodings are usually conceived in the form of evil agencies: demons or ghosts or malevolent spirits, forces of black magic, mysterious concatenations of ill luck. These have given rise to many rites intended to avert ill fortune and bring happiness and good fortune to the new household. Among these are the avoidance of certain days and places as unlucky, or the selection of certain days as being of good omen; the shutting out of evil influences from the place where the wedding is being celebrated; the making of noises, the firing or brandishing of some weapon; the bathing or washing of bride and

bridegroom or sprinkling them with water; the lighting of fires and waving of torches; the circumambulation of the bridegroom's tent or of the church; the beating of the bridegroom's tent, and the observance by the bride and bridegroom of various kinds of abstinences with regard to action and eating. Other rites believed to avert bad luck include disguising the participants who may dress in the clothes of the opposite sex, cover themselves, or paint their faces; substituting for them with effigies; marriage by proxy; and the contracting of mock marriages with trees or animals or inanimate objects. Finally an important antidote against supernatural dangers is thought to be the state of spiritual invulnerability achieved by moral purity and the observance of those mixed ethical and ritual rules that in primitive culture often surround important acts of human life. An important tabu (*q.v.*) of this kind in connection with marriage is that of sex continence. The principle that the couple have to abstain sexually for some time after the wedding is known from primitive savagery to the most refined ethics of the Christian church, while on the wedding night there are occasionally other minor abstinences.

It is characteristic that while the marital pair are often considered vulnerable to dangers they are at the same time esteemed as a source of blessing and beneficent influences. Thus certain rites are supposed to influence favourably the welfare of other persons even independently of their relations to the principals; joining in at a wedding is sometimes believed to produce benefit; a wedding is looked upon as a potential cause of other weddings; while good luck is often expected from contact with the bride or bridegroom or something worn or carried by them.

Marriage as a Sociological Change.—Marriage is a crisis not merely in the spiritual sense. It is also a sociological transition, one or both partners often forsaking old families to form or join a new one. The rupture with the parental family, clan, local community or tribe is expressed in a number of interesting wedding rites: sham fighting between the bridegroom or his party and the bride's family, or some other kind of resistance made by the latter; the barring of the wedding procession; weeping and other ritual expressions of grief and unwillingness on the part of the bride and her relatives; and the enactment of capture or abduction of the bride. These serve as dramatic expression when the bride has to be torn from her old home, and symbolize a violent, critical and final act.

Marriage as a New Bond.—A most important type of wedding rite is one that reflects marriage as a sacramental bond. Here again the symbolism is wide and varied, from the most direct expression of union by the joining of hands or fingers, the tying of garments, the exchange of rings and chains, to complicated dramatic enactments of the separation and union. A symbol of the new ties to be established is the performance of some act that will constitute one of the future duties or privileges of married life. Such acts in a way define the nature and exclusiveness of marriage by anticipation in ritual. Among them are included ceremonial performance of the sexual act and ceremonial participation in a common meal. In certain rites the symbolism lays down the relative domains of marital influence. Thus in some cases the assertion of the husband's power is prominent: he is presented with a whip, or he boxes the bride's ears, or pretends to beat her, and so on. In others the wife may by similar acts mark her independence and power over her husband. The economic aspect of marriage is often also expressed in some magical act intended to ensure prosperity to the future household, *e.g.*, the smearing of butter and honey by the bride over the pole of the tent to ensure abundance of food. The division of economic functions is expressed in rites during which the wife tends fire, prepares and cooks food for her husband, and so on.

The General Function of Wedding Symbolism.—Clearly, wedding symbolism is extremely rich and varied, and embraces almost all aspects of marriage. There are rites that bear directly on sex and gestation; there are rites with clear domestic and economic significance; there are rites referring to emotional attitudes at marriage and to moral notions of its purposes. In technique these rituals are legalistic, magical or religious. In short, the ceremonial of marriage covers and expresses relevant sides of the in-

stitution of marriage, and as such it has been a most fruitful subject of anthropological study. It also has been a major source of errors in interpretation by anthropologists.

In order to avoid such errors it is important to realize that ritual symbolism tends to be vague. Speaking of the marriage ceremonies, Westermarck observed that "Anthropologists are often apt to look for too much reasoning at the bottom of primitive customs. Many of them are based on vague feelings rather than on definite ideas." The ritual symbolism at marriage also commonly expresses mixed and compound meanings. Thus the spilling of corn over the couple may mean fecundity, prosperity, good husbandry as well as union, and probably it vaguely expresses all these elements. Sham fights and captures, marriages to trees or marriages by proxy can have a plurality of meanings.

Nor is the function of symbolism exhausted by its direct and literal meaning. A ritual act also can function to impress through pomp and circumstance its social importance and binding moral significance. The ethical rules and tabus that usually go hand-in-hand with ritual add to this spiritualizing function of wedding ceremonies. The public and official nature of the marriage act, often marked by the presence of an officiating priest, ruler or magician; heralded by banns and public announcements; sealed by witnesses and documents; enhanced by the sacredness of place and time, constitutes the widest and most general function of the rite: to make marriage public, binding, sacred and morally impressive.

The Dissolution of Marriage in Ritual.—The binding nature of the marriage contract, and its ritual and moral character, are expressed as clearly at its dissolution by divorce or death as at its inception. Unfortunately anthropological data in the 1960s were so defective on this point that only a brief survey can be given.

Divorce in technically advanced cultures is often a religious matter, to be carried out under the supervision of theological authorities and with the observance of formalities designed to express and safeguard the sanctity of the sacrament. Primitive cultures have yielded only a few examples of divorce rites, where such symbolic acts as the breaking of a rod, the tearing of a leaf or the casting away of some object are publicly performed (Kachari and Khasi of India; Bagobo of Mindanao; Tumbuka of Nyasaland; certain Canadian Indians; Maori of New Zealand).

Far more available material refers to the persistence of matrimonial bonds at death. They are not known to be dissolved automatically by the decease of either partner among primitive peoples and their tenacity tends to be greater for the widow than for the widower. But in either case the death of one imposes a number of ritual and moral observances on the other, the fulfillment of which is an essential part of the marriage contract.

The widow or widower usually plays the most prominent part among all mourners. Among certain peoples the widow has to perform duties extending over a more or less considerable period at the grave of her husband. She has to sleep beside or over it, supply it with provisions and keep a continuous fire burning there (Carrier, Kutchin, Mosquito and Pima Indians of North America; Mina, Nzakara and Baganda of Africa; Pentecost Islanders and certain Papuans of Oceania; Kuki of India). Even more telling are the long series of tabus and duties to be observed by the widow in some cultures before she is allowed to remarry: she must remain chaste, refrain from bathing or renewing her garments, avoid certain foods and so on (Omaha, Creek, Chickasaw, Algonkin, Iroquois, Dakota and Eskimos of North America; Angoni, Baya, Baganda, Kamba, Herero, Thonga and Zulu of Africa; Bontok of the Philippines; Maori of New Zealand; Amur river tribes, Kuki, Ainu, Yakut and Kamchadal of Asia).

Similar regulations prevent the widower from entering into a new alliance immediately after his wife's death. Thus among many peoples (Greenlanders; Eskimos, Aleut, Dakota, Omaha and Shawnee of North America; Herero, Bushmen, Thonga and Zulu of Africa; certain Papuan tribes; the Bontok and the Ainu) the surviving husband has been reported to live single for a time during which he is subjected to such restrictions and observances as refraining from sexual intercourse.

A most definite affirmation of the persistence of marital bonds is found among those people who have been reported to forbid widows to remarry (Tikopians, Rotumans, Marquesans and Line Islanders in Polynesia; Chinese; Ainu of Japan; Formosans; Brahmans of India) or widowers to remarry (Ainu and Formosans).

Even this is overshadowed by the institution of suttee, the sentence of death passed by religious tradition on the widow at her husband's death so that her spirit might follow his into the next world. This institution was found not only in India, from where it takes its name, but also among the Comanche, Cree and certain Californian tribes of North America; in Dahomey and among the Bafute of Africa; in the New Hebrides, Fiji, Solomon Islands, Pentecost Island and New Zealand of Oceania.

The Social Conditions of Marriage.—*Endogamy.*—Marriage is never free in the sense that any man is at liberty to marry any woman. It is clear that in order to marry, people must come into contact; under primitive conditions this is feasible when they belong to the same tribe, or to tribes that meet in peaceful commerce or in warfare. Tribal or natural endogamy (*q.v.*), is thus a first condition of marriage, but it is of secondary interest to the sociologist, and must be distinguished from strict endogamy.

Endogamy proper is the practice that allows marriage only between members of the same section of a tribe and forbids unions between members of different sections. Strict endogamy is rare. It has occurred mainly in India where members of only the same caste are allowed to marry. Also encountered in India is a system called hypergamy in which a man is allowed to marry a woman of a lower section in his caste. He may also marry a woman of the same section if other conditions allow. But a woman may not marry a man of a lower section on penalty of loss of status of her whole family. In some communities there is competition to secure husbands of high sections. (*See* CASTE [INDIAN].)

In primitive communities endogamy is not widespread. It has been reported in tribes where there is a degraded class of artisans or else stratification by rank (Polynesia; Korea; Japan; Trobriand Islands of Melanesia; Algonkin and Salish of North America; Masai, Nkole, Karanga and other tribes of Africa). In such cases endogamy often has been found in what might be called an approximate form. Indeed such approximate endogamy as a tendency to marry within the profession, class or rank is well-nigh universal.

Another widespread type of endogamy is associated with religion. In few religions is marriage outside the group of the faithful encouraged. Islam, Judaism, Christianity and Hinduism are cases in point. Primitive religions are less involved in endogamy when tribal barriers and lack of communication act with sufficient stringency.

The Prohibition of Incest.—The most widely spread and most rigidly enforced qualification to marriage is embodied in a set of rules prohibiting unions between the members of the same family. Known as the rules of incest (*q.v.*), they play a great part in the constitution of the family and in the regulation of primitive kinship. Incest also assumed great importance in psychology through the influence of psychoanalytic theory.

Although incestuous unions are abhorred and prohibited, rules differ greatly from one society to another as regards their stringency and character. Marriages between mother and son and between father and daughter are commonly prohibited by law, custom and moral sentiment. However, more or less irregular unions between parents and children apparently occur. Marriages between mother and son have been reported from the Carib, Eskimos, Pioge and Tinneh of the Americas; Minahassa of Celebes and Kalang of Java; and New Caledonians. Unions between father and daughter have been said to occur among the Minahassa of Celebes, Karen of Burma and in the Solomon, Marshall and Palau Islands of Oceania. Even better attested to are marriages between brother and sister (Marshall Islands and Hawaii; ancient Irish, Egyptian and Incan royal families).

Beyond the family group the prohibitions of marriage between uncles and nieces, aunts and nephews, first and second cousins, and so on, vary greatly. In some communities certain of these unions are explicitly encouraged and regarded as desirable; in others they

are forbidden. Extensive prohibitions of marriage between distant kindred exist among a number of tribes and cultures (Salish, Eskimos, Aztec, Araucanian, Abipon, Ona and Yahgan of the Americas; Koryak, Yukaghir and Kalmyk of Asia; Torres Straits Islanders of Oceania; southeast Bantu of Africa).

Exogamy.—This is the system under which far larger groups of people are regarded as related to each other and their members forbidden to intermarry. It is found mainly in association with the classificatory nomenclature of kinship terms and clan organization (see EXOGAMY; KINSHIP TERMINOLOGY). Whether exogamy is an extension of the tabu on intercourse and marriage within the family, or an independent institution, was a debated question in the 1960s.

Exogamy based on the dual organization debarbs from intercourse or marriage one half of the tribesmen and tribeswomen (see DUAL ORGANIZATION). Normally exogamy is an attribute of clan, *i.e.*, of a group of people who trace their descent to a common ancestor, usually have the same totem, and fulfill a number of functions together (see CLAN; TOTEMISM). A clan sometimes is a subdivision of a tribe, based numerically on the dual principle, as where there are two, four or eight clans. At times there is an odd and more or less considerable number of clans, and exogamy is enforced only within each of these divisions. The prohibitions as a rule have applied unilaterally (Iroquois, Huron, Mohegan, Miami, Shawnee, Creek, Sauk, Fox, Kickapoo, Blackfoot, Dakota, Seminole, Arawak and Goajiro of the Americas; Tungus, Yakut, Samoyed, Ostyak and Tatars of Asia; various aboriginal peoples of India; Torres Straits Islanders, Papuans and other Melanesians, Polynesians and Micronesians of Oceania; Hottentot, southeast Bantu, Anyanja, Wanyao, Awemba, Makololo, Masai, Kamba, Baganda, Ashanti and other African tribes). Only in a few cases has exogamy been observed with regard to the clans of both parents (Omaha and Osage of North America; certain Naga tribes of Assam; Herero and Lango of Africa).

A specially complex set of conditions has prevailed in the tribes of central Australia with a twofold division into (1) totemic clans that are not strictly exogamous; and (2) matrimonial classes that regulate marriage to the extent that a member of one of them has to marry into a specified one of the remaining classes.

The Forms of Marriage.—The term "form of marriage" has been applied to what might be called the numeric variation in marriage, *i.e.*, the variation according to the number of consorts united to each other. The major forms of marriage usually listed are monogamy, polygyny and polyandry.

Polyandry.—This is the name given to a union in which several men are legally bound in marriage to one woman. Polyandry is among the rarest of the varieties of marriage, and the one on which, in spite of its great theoretical importance, there is unfortunately very meagre and inadequate information. Polyandry has rarely been found among any of the most primitive peoples, and its distribution is almost completely confined to the highlands of southern India and central Asia, with such isolated exceptions as one African people (Hima), some Eskimos, among whom it occurs infrequently, and sporadically among the Great Basin Shoshone.

In Tibet and adjacent areas there exists polyandry of the fraternal type, *i.e.*, several brothers share a wife in common. All the husbands live together with their common wife as members of the same household, and cohabit successively with her. Children born of these marriages are sometimes regarded as the legal descendants of the eldest brother-husband only; in other cases it appears that when a child is born it is attributed to the brother who the mother asserts is the biological father.

Among the Nayar of India there is a form that has played an important part in theories of marriage. A girl goes through a ritual marriage with a man, but then consorts with a number of men who need not be related to one another. She lives apart from her partners, who cohabit with her successively by agreement among themselves. Owing to the matrilineal institutions of this people, the children of such marriages inherit from their mother's brother, but the social importance of fatherhood is seen in the fact that the woman always nominates one or other of the men

as the father of each child, and he is obliged to provide for and educate it. As noted earlier, Nayar marriage in the 1960s was interpreted by some anthropologists as a form of group marriage.

The Toda (*q.v.*) can be taken as representative of a simpler type of polyandry (*q.v.*) in India. Among the Toda a number of men usually two or three brothers, share a wife, but it is the rule that they cohabit with her in succession. The children are not owned in common by the husbands, but each child is allotted to one, not with reference to physical paternity, but in virtue of a ritual act performed by the man over the child to establish social paternity and confer legitimate descent.

Polyandry is thus a compound marriage, in which cohabitation is usually successive, and not joint, while children and property are not shared by the husbands.

Polygyny.—This is a form of marriage in which several wives are united to one man, each wife having the status of legal consort, while her offspring are regarded as the legal descendants of the husband. As an institution polygyny (*q.v.*) has existed in all parts of the world. Few primitive tribes are known in which a man has not been allowed to enter into more than one union. Many peoples have been said to be monogamous, but it is difficult to infer from the available data whether monogamy is the prevalent practice, the moral ideal, or an institution safeguarded by sanctions. It must be remembered that polygyny is not practised throughout the community; it is difficult to maintain a community in which every man has several wives, since this would entail an enormous surplus of females. Also, in reality polygyny is not so much a form of marriage fundamentally distinct from monogamy as rather a multiple monogamy. It is the repetition of a marriage contract, entered individually with each wife and establishing an individual relationship between the man and each of his consorts. As a rule each relationship is little affected legally or economically by the others.

Where each wife has her separate household polygynous marriage resembles very closely a temporarily interrupted monogamy. In such cases there is a series of individual marriages in which domestic arrangements, economics, parenthood and legal and religious elements do not as a rule seriously encroach upon each other. Polygyny with separate households is more commonly reported. Among most Bantu and Hamitic peoples of Africa where the number of wives, especially in the case of chiefs, often has been considerable, each wife commonly occupies a separate hut with her children, and manages an independent household with well-defined legal and economic rights. Where, as among many North American tribes, two or more wives have shared the same household, polygyny affects matrimonial life much more deeply.

In most cases the motive for polygyny is economic and political. Thus in the Trobriand Islands (Melanesia) the chief's income is due to his wives' annual endowment. In many African communities the chief derives his wealth from the plurality of his wives, who by means of the produce of their agricultural labour enable him to exercise the lavish hospitality upon which so much of his power rests. A multitude of wives, however, may increase not only a man's wealth but also his social importance, reputation and authority, apart from the influence of the number of his children. Hence it has been found in many Bantu communities of Africa that the desire to have many wives is a leading motive in the life of almost every man; while the fact that in many Melanesian and Polynesian communities polygyny is a prerogative of the chief testifies to its social prestige.

Monogamy.—Monogamy is not only the most common form of marriage, it is also the pattern and prototype of marriage. Both polyandry and polygyny are compound marriages, consisting of several unions combined into a larger system, but each of them constituted upon the pattern of a monogamous marriage. As a rule polygamous cohabitation is a successive monogamy and not joint domesticity; children and property are divided, and in every other respect the contracts are entered individually between two partners at a time.

Monogamy as the unique and exclusive form of marriage in the sense that bigamy is regarded as a grave criminal offense and a sin as well as a sacrilege, is very rare indeed among primitive

groups. Such an exclusive ideal and rigid legal view of marriage is perhaps not to be found outside the modern, relatively recent development of western culture. Some argue that it is not even implied in Christian doctrine. Apart from such isolated phenomena as the Church of Jesus Christ of Latter-Day Saints (Mormons) and the heretical sect of Anabaptists (16th century), polygyny was legally practised in Europe and accepted by the Christian church in the middle ages, and it occurred sporadically as a legal institution accepted by church and state as recently as the middle of the 17th century.

Monogamy as the pattern and prototype of human marriage, on the other hand, is universal. The whole institution, in its sexual, parental, economic, legal and religious aspects, is founded on the fact that the functions of marriage—sexual union, production and care of children, and the co-operation it implies—require essentially two people.

B. K. Malinowski asserted (1929) that conjugation necessarily takes place only between two organisms; children are produced by two parents only, and always socially regarded as the offspring of one couple; the economics of the household are never conducted group-wise; the legal contract is never entered upon jointly; the religious sanction is given only to the union of two. A form of marriage based on communism in sex, joint parenthood, domesticity, group-contract and a promiscuous sacrament had never, he said, been described. He claimed monogamy is, has been and will remain the only true type of marriage. To place polygyny and polyandry as forms of marriage co-ordinate with monogamy was held erroneous. In his thinking, to speak about group marriage as another variety shows a complete lack of understanding as to the nature of marriage.

Theories of Marriage.—Theories of marriage have been concerned largely with its origins and history, and attempts have been made to range the various forms of marriage into an evolutionary series. However, if it is understood that varieties of marriage are determined by the type of community, its economic and political organization, and the character of its material culture, the problem becomes one of observation and analysis, and ceases to move on the slippery plane of hypothesis.

The view that marriage originated in promiscuity, hetaerism or matrimonial communism and that monogamy is a product of gradual development through a number of stages was advanced by Bachofen, McLennan and L. H. Morgan; it found support in the work of such eminent writers as Lord Avebury, A. W. Howitt, H. Spencer and F. J. Gillen, J. G. Frazer, A. O. Kovalevski, W. H. R. Rivers, Briffault and others; and was criticized and opposed by Darwin, Westermarck, Malinowski, A. E. Crawley, C. G. Lang and others. This theoretical schism was continuing in the 1960s.

Despite theoretical arguments, disputes over marriage as a sacrament as compared with a civil contract and other speculative disagreements, primitive marriage as an area of anthropological interest increasingly has become a subject of empirical research. As communication among peoples has been facilitated, many of the primitive marriage practices discussed here appear to have disappeared or to be in the process of extinction and change; where they persist in many cases it seems to be largely as a function of cultural isolation.

MARRUCINI, an ancient tribe which occupied a small area around Teate (modern Chieti) on the east coast of Italy. Though kinsmen of the Samnites, the Marrucini were probably not members of the Samnite league; yet they came into conflict with the Romans during the Second Samnite War, at the end of which they entered the Roman alliance (304 B.C.). Loyal to Rome during the Second Punic War, they revolted in 91 B.C.; thereafter they were enrolled in the Roman tribe Arnensis. Their language is known from an inscription, the "Bronze of Rapino" (c. 250 B.C.). It is written in the Latin alphabet, but in a dialect of the northern Oscan group (see *ITALIC DIALECTS*; *PAELIGNI*). The earliest Latin inscriptions belong to the Ciceronian period.

For the "Bronze of Rapino" see R. S. Conway, *The Italic Dialects*, pp. 253 ff. (1897).

MARRYAT, FREDERICK (1792-1848), English naval officer and novelist, the author of *Mr. Midshipman Easy* and other tales of adventure at sea, and of *The Children of the New Forest*, a story of the English Civil War which has stirred the imagination of generations of children, was born in London, July 10, 1792. His father owned land in the West Indies and was for some time chairman of Lloyd's. Marryat entered the Navy at the age of 14 and served with distinction in many parts of the world. He rose to captain's rank and was made a companion of the Bath for his conduct in the first Burmese War (1824-26). He also devised a code of flag signals (1817) which was long in use and for which he was made a member of the French Légion d'Honneur. He retired in 1830.

Captain Marryat was the first novelist of importance since Tobias Smollett to make full and amusing use of his varied experience at sea. He had an admirable gift of lucid, direct narrative, and an unflinching fund of incident, and of humour, sometimes bordering on farce. His first book, *The Naval Officer: or Scenes and Adventures in the Life of Frank Mildmay* (1829), was succeeded by a series of which the most popular were *The King's Oum* (1830), *Peter Simple* (1834), *Jacob Faithful* (1834), *Japhet in Search of a Father* (1836), *Mr. Midshipman Easy* (1836; written in three weeks), and *Poor Jack* (1840). From 1832 to 1835 he edited the *Metropolitan Magazine*, in which many of his stories first appeared. In 1837 he went to Canada and the United States, publishing his critical impressions on his return in 1839. His first story written specifically for children was *Masterman Ready* (1841-42); this was followed by *The Settlers in Canada* (1844), *The Children of the New Forest* (1847), and the posthumous *The Little Savage* (1848-49), completed by his son Frank. In his later years he lived and farmed at Langham, Norfolk, where he died on Aug. 9, 1848.

BIBLIOGRAPHY.—*The Life and Letters of Captain Marryat* were published by his daughter Florence in 1872. See also Christopher Lloyd, *Captain Marryat and the Old Navy* (1939); Oliver Warner, *Captain Marryat: a Rediscovery* (1953). (O. M. W. W.)

MARS (MAVORS, MAMAR, MARSPITER or MASPITER), after Jupiter the most important deity of the Roman state. He was commonly identified with the Greek Ares (q.v.), but was never so much affected by foreign influences as to lose his essentially Roman and Italian character. The importance of this deity throughout central Italy from the earliest times is reflected in the fact that Alba Longa, Falerii, the Hernici, Aricia, Tusculum, Lavinium, the Aequi, the Peligni, and the Sabines all had months named for him. At Rome, Martius (March) was the first month of the old calendar.

In spite of his importance, little is known of the original character of the Italian deity, and what is known (chiefly from the cult at Rome) is variously interpreted. It is clear that by historical times he has developed into a god of war (hence his

connection with Ares), and in Roman literature he is protector of Rome, a nation proud in war, which traced its founding back to a son of Mars, Romulus. There are at least three tenable views, however, of his ultimate origin: (1) that he was originally a war god whose functions were extended to the physical and hence the spiritual protection of the fields and crops; (2) that he was originally a deity connected with the fertility of the soil, of chthonian nature and thus a god of death and war; and (3) that he was originally a high god of the Italian peoples who were both warlike and agrarian and thus he reflects their interests.

The problem probably cannot be solved, for evidences of all three possibilities are found in his cult.

Mars's festivals at Rome occurred in the spring and the fall, embracing both the agricultural and the military seasons. The month of March was, as might be expected, especially filled with festivals wholly or partially in his honour. The *Feriae Marti*, March 1, was New Year's Day in the old Roman calendar; the second *Equirria*, "horse races," occurred on March 14 (the first *Equirria*, Feb. 27); the *Quinquatrus* on March 19 was originally a festival of Mars which eventually was extended over a five-day period and became a festival of Minerva (*q.v.*); and the *Tubilustrium*, a purification of the war trumpets, occurred on March 23. All these have a connection with the initiation of the war season. Significant also is the role played through this period up to March 23 by the ancient priesthood of the *Salii* (*q.v.*), particularly associated with Jupiter, Mars and Quirinus, who came out several times during the month to dance their ceremonial war dance in old-fashioned armour and chant a hymn to the gods. Again at the end of the season, October was an important month for Mars. The festival of the October horse on Oct. 15 was marked by a two-horse chariot race in the *Campus Martius*, one of the winning pair being sacrificed to Mars. On Oct. 19 the *Armilustrium* marked the purification of the arms of war and their storage for the winter.

Certain features in the Mars cult, however, make it probable that the god was connected in early times at least with agriculture, and some of the features of the festivals already enumerated can be explained equally well as of agricultural origin. Thus Mars was invoked in the ancient hymn of the Arval brothers (*q.v.*), whose religious duties had as their object to keep off enemies of all kinds from crops and herds, and in this his association with the *Lares* (*q.v.*) would suggest that he is not regarded as a war god who could avert the raid of an enemy. Likewise in Cato's description of the annual lustration of his land by the Roman farmer (*de Agricultura*, 141), where pure Italian cult might be expected to be reflected, Mars (with the cult title *Silvanus*) is invoked to ward off disease, calamity, dearth and infertility with no mention of his war function. Cato describes the ritual in detail; the procession around the field, the recitation of the prayer to Mars after libations to Janus and Jupiter, and the sacrifice of the pig, sheep, and ox (*suovetaurilia*), representing the farmer's most valuable stock. This description has been taken to be a miniature of the state rite in the lustration of the *Ager Romanus* which, if true, would make Mars the chief deity worshiped at the *Ambarvalia* (*q.v.*).

The festival of the October horse, mentioned above, an undoubtedly primitive rite, has definite associations as a harvest fertility ceremony. Although the animal sacrificed was a war horse, the head was cut off and decked with cakes as an object having the power to procure fertility. Thus the festival may equally mark the end of the harvest as well as the end of the war season. Even Quirinus (*q.v.*), who is associated with Mars as a war deity, is not without agricultural connections, for it was his *flamen* who sacrificed the victims at the *Robigalia* on April 25, when the spirit of the mildew (*Robigus*) was invoked to spare the grain.

Until the time of Augustus, Mars had but two temples at Rome. One of these, originally only an altar, was in the *Campus Martius*, the exercising ground of the army. The other was outside the *Porta Capena* and there each year the *Equites* met in order to start in procession through the city. Each of these sites was outside the *pomerium*, and this has been explained to mean that the war god "must be kept at a distance" (J. B. Carter, *Religion of Numa*, p. 19). But in the heart of the city there was a *sacrum* of Mars in the *regia*, originally the king's house, in which the sacred spears

of Mars were kept, or rather, Mars in spear form (*Mars Hasta*); for on the outbreak of war the consul had to shake these spears, saying, "*Mars vigila*" ("Mars, wake up!"). If the spears moved of themselves the omen was bad and called for expiation.

Under Augustus the worship of Mars at Rome gained a new impetus; not only was he traditional guardian of the war affairs of the Roman state but as *Mars Ultor* he became the personal guardian of the emperor in his role as avenger of Caesar. The temple of *Mars Ultor* vowed at Philippi was not dedicated until 2 B.C., but then it dominated the magnificent Forum of Augustus, occasionally referred to as the Forum of Mars. His worship at times rivaled that of Capitoline Jupiter and about A.D. 250, Mars became the most prominent of the *di militares* worshiped by the Roman legions.

In literature and art he is hardly distinguished from the Greek Ares.

(R. B. Ld.)

MARS is the fourth planet in order of distance from the sun and the next beyond earth. When within 100,000,000 mi. of earth it is too bright to be easily mistaken for a star. When more distant, however, it might be confused with a bright red star such as Antares or Aldebaran. At an exceptionally close opposition (*i.e.*, when on the opposite side of earth from the sun), Mars outshines Jupiter for a few weeks, and becomes the fourth brightest object in the heavens, being exceeded only by the sun, moon, and Venus. When one gazes at the planet glowing in the sky like a red danger signal, it is easy to understand why the ancient people identified this object with the god of war—the Romans with Mars, the Greeks with Ares.

Owing to the photographs taken by the U.S. spacecraft *Mariner 4* in July 1965, more is known about the surface of Mars than of any other body in the solar system except the moon and earth. *Mariner 4* was launched from Cape Kennedy, Fla., in November 1964, and traveled 326,000,000 mi. in 228 days to reach Mars.

TABLE I.—Elements of Orbit of Mars
(For epoch Jan. 1, 1960, at 12 hr. ephemeris time)

Mean distance (in astronomical units)	1.523691
Eccentricity	0.093368
Inclination	1.84991°
Mean longitude of node	49.24903°
Mean longitude of perihelion	335.32269°
Sidereal period	686.9804 days
Mean synodic period	779.94 days
Distance from sun	
Mean	141,500,000 mi. (227,700,000 km)
Perihelion	128,300,000 mi. (206,500,000 km)
Aphelion	154,800,000 mi. (249,100,000 km)
Distance from earth	
Mean opposition	48,695,000 mi. (78,365,000 km)
Minimum distance	34,670,000 mi. (55,795,000 km)
Maximum distance	247,900,000 mi. (398,950,000 km)
Orbital velocity	
Mean	15.0 mi./sec. (24.1 km./sec.)
Perihelion	16.4 mi./sec. (26.4 km./sec.)
Aphelion	13.6 mi./sec. (21.9 km./sec.)

Source: *Explanatory Supplement to the American Ephemeris and Nautical Almanac* (1961).

The spacecraft reached the planet within about 200 mi. of its selected position. In 22 minutes the television camera secured 19 useful photographs of the planet before crossing the evening terminator into the unilluminated hemisphere. The pictures covered a strip about 200 mi. wide and 3,000 mi. long, beginning near the Trivium Charontis and ending in Aonius Sinus. The area photographed was about 1% of the surface area of Mars. See also SPACE EXPLORATION.

MOTIONS OF MARS

Most of the time Mars is so far from the earth and so nearly in our line of sight with the sun that observations are unsatisfactory or useless. Usually Mars can be observed to advantage only for about two months before and after opposition. As is shown in the diagram, the orbit of earth appears as a circle centred on the sun, but the orbit of Mars is considerably off centre. The

orbits are not circles, however, but are slightly elongated closed curves called ellipses, with the sun at one focus of the ellipse. The orbit of earth is so slightly eccentric ($e = 0.017$) that its departure from a circle cannot be detected in a diagram. The

FROM FRED L. WHIPPLE, "EARTH, MOON AND PLANETS"; REPRODUCED BY PERMISSION OF THE BLAKISTON COMPANY

OPPOSITIONS OF MARS FROM EARTH (1939-71). RELATIVE DISTANCES ARE SHOWN BY STRAIGHT LINES JOINING THE ORBITS. MARS IS NORTH OF EQUATOR FOR OPPOSITIONS FROM SEPTEMBER TO MARCH

orbit of Mars is sufficiently eccentric ($e = 0.093$) that its ellipticity is just appreciable to the eye.

When opposition occurs near perihelion (point of the orbit nearest the sun), Mars may come as close to the earth as 35,000,000 mi. When opposition occurs near aphelion (point of the orbit farthest from the sun), the distance may be as much as 63,000,000 mi. Mars and earth are in opposition on an average of once every 26 months. The favourable oppositions occur in July, August, and September; the unfavourable ones are in January, February, and March. The exceptionally favourable oppositions occur at intervals of either 15 or 17 years. The last close opposition was in September 1956, when Mars came within 35,200,000 mi. of earth. The next close one will be on Aug 6, 1971, when Mars will be 35,080,000 mi. distant, and after that on Sept. 28, 1988, when the distance of the planet will be 36,300,000 mi. (These dates and distances are subject to slight change when better data become available.)

SEASONS

The equator of Mars is tilted to the plane of its orbit by nearly 25° , or 1.5° more than earth. The north pole of Mars is directed toward longitude 354° ; the north pole of earth toward longitude 90° . As a consequence, the beginnings of the four seasonal positions in the orbit of Mars occur at approximately the same time as those for earth. But they are not the same seasons. If Mars were at opposition on the dates when the seasons begin on earth, the correspondence would be as shown in Table II.

TABLE II.—The Martian Seasons

Date	Approximate distance of Mars from earth (mi.)	Beginning of season in northern hemisphere of earth	Beginning of Martian season	
			Northern hemisphere	Southern hemisphere
March 21	61,000,000	Spring	Summer	Winter
June 21	41,000,000	Summer	Autumn	Spring
Sept. 23	35,000,000	Autumn	Winter	Summer
Dec. 22	51,000,000	Winter	Spring	Autumn

Since the axial tilt of Mars to its orbit is nearly the same as

that of earth, the seasonal variations are roughly the same for both planets. The orbit of earth is so nearly circular that the intensity of sunlight it receives scarcely changes throughout the year, but the orbit of Mars is so eccentric that the intensity of sunlight received at perihelion is 45% greater than at aphelion. The changes in distance are apparent in the behaviour of the polar caps. Mars is at perihelion during the southern summer and at aphelion in the northern summer. As a result, the south polar cap often disappears in summer whereas the northern cap has never been known to vanish.

Since the Martian year is nearly twice as long as that of earth, the seasons there are correspondingly longer.

TABLE III.—Length of Seasons on Mars and Earth

Seasonal interval	Northern hemisphere		Southern hemisphere	
	Earth	Mars	Earth	Mars
Winter to spring (days)	89	160	93	182
Spring to summer	93	199	90	146
Summer to fall	93	182	89	160
Fall to winter	90	146	93	199
Length of year	365	687	365	687

The aspect of Mars at opposition differs widely depending upon the date. At the favourable oppositions of summer the south pole is presented to earth, and hence it is on these occasions that observers on earth get the best view of the southern hemisphere of the planet. Conversely, the north pole is presented to earth at the unfavourable oppositions of winter. This is a fortunate circumstance because most of the interesting surface features are in the southern hemisphere of the planet.

TEMPERATURE

The only practical means of determining the temperature of a body (such as a planet) millions of miles from earth is indirect: by measuring the heat or radiant energy it transmits to earth. The hotter a body is, the more heat it radiates, and the amount of heat received at any point depends upon the distance from the source of radiation. The heat of a candle, for example, can be felt a few feet away. On the other hand, the sun's radiation is perceptible even at a distance of 93,000,000 mi. If one can measure the amount of heat a body radiates per unit area of surface, one can calculate the temperature of the body from the laws of radiation. The absolute temperature is proportional to the fourth root of the energy radiated. The heat radiated from a planet is exceedingly weak but can be measured by sensitive detectors placed at the focus of a large telescope.

Radiation received from a planet is of two kinds: the sunlight reflected from its surface and the true planetary radiation resulting from the temperature of the emitting surface. The two kinds of radiation are widely separated in wavelength: reflected radiation lies mostly in the visual region of the spectrum, while low-temperature planetary radiation is in the far infrared region. The two kinds of radiation can be separated by interposing a suitable filter in the beam that is being measured. The sensitive receiver upon which the radiation falls is so small that the temperature of various parts of the surface of the planet may be measured individually.

Measurements of the radiation from Mars were made in 1924 and 1926 by Seth B. Nicholson and Edison Pettit at the Mount Wilson Observatory, and by W. W. Coblentz and C. O. Lampland at the Lowell Observatory. Nicholson and Pettit found that the temperature of the south polar cap of Mars was about -70°C (-94°F), that of the sunset edge about -13°C (8.6°F), and that of the point directly under the sun about 10°C (50°F). Coblentz and Lampland obtained somewhat higher values but the two sets of results were in remarkable agreement, considering the difficulties of the measurements. Since Mars never shows more phase than the moon when about three days from full, the radiation from the surface at midnight cannot be measured directly. But the minimum night temperature on Mars was estimated by Gerard P. Kuiper as -100°C (-148°F).

Radiometric temperature measurements of Mars were made with the 200-in. Hale reflector in 1954 by W. M. Sinton and

J. Strong, using a Golay detector about twice as sensitive as the best thermocouple tested. The temperature of Mars at the centre of the disk was found to be 15°C (59°F). The temperature near the equator at the sunrise limb was about -60°C (-76°F) and the temperature at noon near the equator about 25°C (77°F). The temperature of a yellow cloud, which appears on photographs taken by others, was -25°C (-13°F). Dark areas were a few degrees warmer than adjacent bright areas.

The mean daytime temperatures over the entire disk of Mars for all seasons has been estimated at -33°C (-27.4°F). This agrees fairly well with the microwave brightness temperature at 3.15 cm. of -62°C (-79.6°F) (J. A. Giordmaine, L. E. Alsop, C. H. Townes, and C. H. Mayer, 1959). This temperature applies to some level beneath the surface and is an average value for the whole disk.

ATMOSPHERE

That Mars has an atmosphere of some sort is evident from casual observations made when the planet is close enough to the earth for its surface features to be easily discerned. That these features are often obscured or dimmed as if by mists or clouds was noted as early as 1784 by Sir William Herschel.

Valuable information concerning the atmosphere of Mars has been obtained from photographs of the planet made in light of different colours. Blue and violet light have slight ability to penetrate an atmosphere because they are strongly scattered by fine particles. Yellow, orange, and red light, because of their longer wavelengths, are not so easily scattered and therefore are more penetrating. The effect is conspicuous on terrestrial photographs of distant objects. On photographs taken in violet light a distant landscape appears dim and flat or is wholly invisible, but the landscape generally stands out sharply on photographs taken in red light.

Attempts were made to photograph Mars even before the beginning of the 20th century, and several observers were successful in obtaining images of good quality at the close approach of Mars in 1909. Not until the opposition of 1924, however, was photography in light of different colours applied to Mars with conspicuous success by W. H. Wright at the Lick Observatory, and by E. C. and V. M. Slipher at the Lowell Observatory. These photographs showed the same effects as those exhibited by the terrestrial landscape. Thus, photographs of Mars in visual light (yellow, orange, and red) penetrated the atmosphere and revealed the surface markings. The polar cap is an inconspicuous feature on such images. In blue light the planet usually shows only a flat, featureless disk except for the polar cap, which appears much larger than on the photographs taken in visual light.

Generally, images taken in blue light are appreciably larger than those taken in visual light, and attempts have been made to determine the thickness of the Martian atmosphere by measuring this difference in size. The visual images presumably show the solid surface of the planet, while the blue images include the outer atmospheric shell. Theoretically, the method sounds plausible, but errors introduced by contrast effects and spreading of the image seem so serious as to render the method of doubtful value. For example, on blue and violet images the polar cap appears as a bright protuberance projecting considerably beyond the rest of the disk.

Clouds.—Mars shows two principal types of clouds: those that appear as conspicuous markings on the blue and violet images; and yellowish clouds that may be detected visually and that show on photographs taken in visual light. Occasionally there is a cloud that is visible in both blue and yellow light. Such a cloud was photographed at the edge of the planet from Mount Wilson Observatory in 1954. When the clouds project beyond the line between daylight and darkness (the terminator), or when they appear as protuberances at the edge of the disk, their height can be measured, although roughly. The blue clouds seem to be at a higher level than the yellow clouds, but reliable values for their relative heights are lacking.

A remarkable cloud showed on the blue images taken in 1954 and 1958, which, when viewed with the south pole uppermost, resembled

the letter W. The marking was on the equator centred at about longitude 110° . There was a distinct knob at the western end of the W, and at the three intersections of the lines forming the strokes of the letter. The diameter of the knobs was about 280 mi. and the strokes between them 1,000 mi. in length. The knobs fell near the positions of "oases" and two of the stripes coincided roughly with the "canals" named Ulysses and Fortunae (see *Canals*, below). Photographs of the W taken by E. C. Slipher in South Africa showed that it had an intermittent existence, forming in the afternoon and disappearing at night. Similar markings had been noted over this region at previous oppositions; e.g., in 1926 by Wright and F. E. Ross. They also observed a cloud that formed about Martian noon and which became more intense as it was carried by rotation toward the evening terminator. Wright suggested that the cloud was a convective phenomenon of the Martian afternoons, recurrent over several days.

Blue Mist.—As already stated, the atmosphere of Mars is transparent to yellow light but remarkably opaque to blue, violet, and ultraviolet light. This opacity may be described as a blue mist. Photographs of the spectrum of Mars show that the opacity to blue light begins at a wavelength of about $\lambda 4,400$.

On rare occasions, however, the blue mist clears to such an extent that the surface markings show almost as distinctly in blue light as in yellow. Attention was first directed to the blue clearing as a distinctive Martian phenomenon by E. C. Slipher of the Lowell Observatory in 1937. Notable instances of the blue clearing occurred in 1937, 1939, and 1941; in each case within a few days of opposition. At other oppositions, however, no blue clearing was observed. In 1954 the atmosphere of Mars was unusually transparent to blue light from May until July 2 (opposition date, June 25), when the atmosphere suddenly became opaque to blue light again.

At the opposition of 1956 extensive blue clearing was recorded by Gérard de Vaucouleurs in Australia, between Aug. 28 and Sept. 3, during which period the surface markings of the Syrtis Major and Mare Cimmerium were distinctly visible at wavelengths of $\lambda 4,400$ and $\lambda 4,800$. The end of the period was well defined, for the markings which were clearly recorded on plates taken Sept. 3 at 14:00–14:30 UT (universal time) were almost invisible on those taken Sept. 4 at 14:20–15:00 UT. No observations were taken near opposition on Sept. 10, but the violet layer was completely opaque and nearly uniform by Sept. 15.

Scarcely a trace of the blue clearing was observed from other points on earth in 1956, possibly because of a dust storm which developed suddenly on Aug. 30 over the Mare Sirenum area, and which eventually obscured a major section of the southern hemisphere of the planet by late August and early September. By Sept. 5 the atmospheric dust had covered the entire planet except the south polar region. The blue clearing was detected from Australia because the face of the planet that was visible from there was practically free of obscuration during the critical period.

There is no generally accepted explanation for the clearing of the blue mist. The fact that it has occasionally been observed to occur near opposition is of doubtful significance. This may be purely an observational effect since the planet is under intensive scrutiny at that time.

Composition of Martian Atmosphere.—Attempts have been made to detect oxygen and water vapour in the atmosphere of Mars by spectroscopic analysis ever since the pioneer work of the Pierre Jules Janssen and Sir William Huggins about 1867. The chief obstacle to detection is earth's atmosphere. The problem is how to distinguish absorption due to oxygen and water vapour in the spectrum of Mars from the very strong absorption produced by these molecules in earth's atmosphere. Two methods have been tried.

The older method consists in comparing the spectrum of Mars with the spectrum of another body, the moon, which is identical with Mars in every respect except that it has no atmosphere. Consider the history of a beam of light reaching earth from Mars. Starting from the sun, it first passes through the Martian atmosphere down to that planet's surface. From the surface it is reflected through the atmosphere again into outer space. Light re-

ected toward earth passes through the astronomer's telescope and onto a photographic plate or other recording device. The beam that reaches earth therefore has passed twice through the atmosphere of Mars and once through earth's atmosphere. Now consider a beam of light reflected from the surface of the moon. The moon has no atmosphere. Thus the spectrum of moonlight is nothing but reflected sunlight that has passed once through earth's atmosphere. The absorption lines of oxygen (O_2) and water vapour in the spectrum of Mars are compared with those of the moon under as nearly identical conditions as possible. If these lines are stronger in the spectrum of Mars, it must be a result of the additional absorption produced by oxygen and water vapour in that planet's atmosphere. The method is sound in principle but difficult to carry out in practice. The moon and Mars must be observed at the same altitude in the sky, and the humidity at the point of observation must be the same at the time of both measurements—conditions that are seldom realized. Moreover, it is difficult to get photographs of two different objects that match so closely that detailed comparisons of them can be made. For this reason the method of lunar comparison has fallen into disuse.

About 1902 Percival Lowell devised another method which seemed more promising. As Mars and earth revolve around the sun the distance between them is continually changing. At times the two planets are nearly stationary relative to each other as when they are nearest and farthest apart. At other times their velocity directly toward or away from each other may reach 12 mi. per sec. This velocity should be sufficient to produce a Doppler effect (see LIGHT), which shifts a line in the spectrum of Mars slightly away from the position of the same line in the spectrum of earth's atmosphere. This method consists of comparing the relative positions of spectrum lines on the same plate, a comparison in position being much easier to make than one of the intensities of spectrum lines on different plates.

Such tests for oxygen and water vapour in the spectrum of Mars were made in 1934, 1937, and 1941 by W. S. Adams and Theodore Dunham, Jr., with the 100-in. telescope at the Mount Wilson Observatory when the planet had reached nearly its maximum velocity toward and later away from earth. Study of the contours of the oxygen lines failed to reveal any asymmetry sufficient to indicate that oxygen was present in the Martian atmosphere to the extent of 1% of the quantity in earth's atmosphere. A similar conclusion was reached regarding the presence of water vapour in the atmosphere of Mars.

The only substances that have been identified in the Martian atmosphere are carbon dioxide (CO_2) and water vapour (H_2O). Carbon dioxide was first detected by G. P. Kuiper in 1947. Results obtained from observations of Mars in 1963 indicate that there is about 40 times the amount of carbon dioxide in a vertical column over the Martian surface than there is over the surface of earth. In 1963 spectroscopic evidence was finally obtained for water vapour after nearly a century of search. On a high-dispersion spectrogram taken with the 100-in. telescope at Mount Wilson Observatory rotational lines of H_2O near $\lambda 8,300$ and CO_2 near $\lambda 8,700$ were detected (L. D. Kaplan, G. Münch, and H. Spinrad). They found for H_2O $14 \pm 7 \mu$ precipitable water, and 55 ± 20 m.atm. of CO_2 . From the absence of oxygen in the Martian spectra, they set an upper limit of 70 cm.atm. for the O_2 content.

A. Dollfus, from infrared radiometric comparisons between the moon and Betelgeuse at an elevation of 12,000 ft. in the dry air of the Swiss Alps, found that higher readings were always obtained on the Martian water-vapour bands than upon his control objects. He estimated that if all the water in the Martian atmosphere in the form of an invisible gas were condensed into liquid water, it would produce a uniform liquid film over the surface of the planet 1.000 in. in depth. His estimate of the abundance of water vapour in the Martian atmosphere is about 15 times that of the Mount Wilson observers.

The Mount Wilson observations give a total surface atmospheric pressure of 25 ± 15 mb., much lower than the value of 85 mb. generally accepted before. This means that the atmospheric pressure at the surface of Mars is only about 1 to 2% as much as at
